UTAH.—On the 472 level, in the north lateral drift, 73 feet north of east crosscut No. 1, east crosscut No. 2, has been extended 52 feet; total length, 132 feet. The formation is porphyry, clay and quartz.

ALTA.—Repairs to machinery and works completed; also to main shaft. One or two drifts are now being repaired. Are ready to resume work whenever orders to do so are received from below.

ALPHA.—The north lateral drift on the 500 level is in from the shaft 94 feet. The face is in quartz. The south lateral drift on the 500 level is in 23 feet. It is all the way in quartz, but of low grade.

KEYSTONE.—Work on the new mill is being rushed as rapidly as possible. A large amount of ore is on the dump ready for milling, and much good ore has been opened up in the mine.

BEST AND BELCHER.—The sinking of the winze below the 300 level in the new west ore body has been resumed, and it is said that the deposit improves as it is followed downward.

GOULD AND CURRY.—There are good bodies of ore opened out on the 200 and 400 levels, and the exploring drifts are passing through ground of a promising appearance.

YELLOW JACKET.—A good deal of repair work of various kinds is in progress. The mine will resume operations in excellent shape, both on the surface and under ground.

UNION CON. AND MEXICAN.—The main drift on the 1465 level is being advanced in Mexican ground. The material remains the same.

OCCIDENTAL.—Extracted 143 tons of ore and shipped to the Atlanta mill 150 tons; average assay value of wagon samples, \$28.

SEG. BELCHER.—Work in the upraise is making the usual progress. The formation is of a favorable character.

SIERRA NEVADA.—West crosscut No. 2 on the 520 level is still in quartz and porphyry giving low assays.

LADY WASHINGTON.—Work in the raise above the 725 level is being pushed ahead as usual.

SCORPION.—Since last report the west crosscut, 300 level, has been advanced 38 feet.

BULLION.—The usual work is in progress on the 500 and 600 levels.

BALTIMORE.—Prospecting operations are still vigorously prosecuted on the 338 level in ground of

a very promising character. A considerable amount of ore is being accumulated, which will presently be worked at the company's 10-stamp mill situated at the mine.

OVERMAN.—Explorations below the tunnel level are continued.

CONFIDENCE.—Are ready to resume operations in good shape.

OPHIR.—The south drift on the 1465 level is still in porphyry.

ANDERS.—Are still doing some repair work.

Silver Peak District.

RAILROAD AND WATER.—Inyo Independent, Oct. 20: There is likely to be a big mining excitement over Silver Peak. The locality is Nevada, east from Big Pine. A survey is now being made for a railroad from Silver Peak to the ranch of John Chistovich, a distance of 24 miles. There is an abundant supply of water at the Chistovich place, and it is proposed to build mills there. Another proposal is to convey the water in pipes to the mines instead of building a railroad. It is alleged that water pipes could be laid at a less expense than a railroad could be built, and once the pipes were laid there would be no cost for operating expenses as would be the case with a railroad.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Oct. 19: The crosscut from the north drift, 250-foot level, extended 12 feet; rock a little softer in the face.

GRAND PRIZE.—During the week water has been hoisted continually, and is now down a distance of 64½ feet below the 300-foot level station.

NORTH BELLE ISLE.—Have started front stop on the 400-foot level near the Queen line, which shows some very high-grade ore.

DEL MONTE AND NORTH COMMONWEALTH.—The Combination shaft has been sunk and timbered six feet. During the week some ore was encountered giving good assays.

NAVAJO.—The stopes on 350-foot level show some very high-grade ore. The stopes on the east vein from the intermediate level have yielded as usual.

FOUND TREASURE.—Some ore has been taken out and hoisted to the surface during the week.

NEVADA QUEEN.—The mill was stopped 24 hours to clean the boiler, otherwise has been running steadily and doing good work. Average assay from the battery pulp, \$185 per ton. Three hundred and fifty carloads concentrating ore have been hoisted; average assay \$22.20 per ton. Concentrating works are finished, all ready to start up. Work on the new mill is progressing nicely.

COMMONWEALTH.—100-foot level: West drift from main south drift has been extended 18 feet. The ore is two feet wide and good grade. No. 1 winze from east lateral drift has been sunk eight feet, following the ore which shows well. North drift from joint crosscut on south line has been extended 15 feet, opening up high grade. A drift has been started from top of No. 4 chute to open the ore north of the shaft, preparatory to stoping. This drift has been extended west 23 feet and east 10 feet. The ore extracted from the drift is very rich.

Wild Rose District.

PARADISE MINES.—*Silver State*, Oct. 17: The new hoisting works in the Wild Goose shaft, on the Paradise Valley Co.'s mines were started up last week, and at latest reports a body of fine ore was cut in the shaft.

ARIZONA.

AROUND PRESCOTT.—*Journal-Miner*, Oct. 17: Receipts of ore at the Prescott Sampling Works are on the increase. A deed from Frank Ryland to J. C. Rankin, for the Southern Belle mine, Tiger district, has been filed for record. Price, \$12,000. The new road to Copper Basin has been completed. One of the best evidences of the increased activity in the mines of this section is the fact that a mining superintendent has been trying for a week to engage five or six miners in Prescott, and has been unable to do so. J. J. Williams of Copper Basin accompanied Governor Tittle out to the Blue Dick mine a few days ago, and made a thorough examination of the property. They found very much larger bodies of low-grade ore than was anticipated, and it is thought that they can succeed in working them satisfactorily. Chas. A. Girdler returned to-day from a visit to the Amulet mine, on Lynx creek, owned by J. M. W. Moore. He reports very favorably on the property. He says there are over 2000 tons of second-quality ore on the dumps, which will go over \$20 per ton, the first-class ore being shipped to Denver. Mr. Moore contemplates the erection of machinery to treat his second-class ore at the mine. Messrs. Burrington & Harlan were in town today again with a bar of gold weighing 99 ounces, extracted from their Howard mine. Its total value was about \$700. This mine has produced a fabulous sum for the amount of work done on it. The deepest working is only about 60 feet, while over \$20,000 has been taken out, without any stoping having been done, except a few feet in connecting the tunnel with the shaft.

VARIOUS CAMPS.—Prescott *Journal-Miner*, Oct. 17: John Curtin and Nelson Gable have taken a lease on the Goodwin mine in Turkey creek. Chas. Thompson has sold one-fourth of the Mayflower and Copper Lion mining claims to H. S. Van Beuren for \$200. F. W. Mitchell came in last evening from the Clarence Ruby mine. Work has been temporarily suspended again on this property. Chas. H. Akers has leased the Trap Rock, formerly the Happy Jack mine, on Lynch creek, to Henry Goldwater and Frank Howard. The Boaz Co. at Minnehaha flat is pushing work on its mill, and expects to have it completed ready to drop stamps before the 1st of November. The Crowned King Co. has 150 tons of \$100 ore on their mill-dump, and will start up their mill again in a few days, having succeeded in obtaining a supply of water. Mr. Clark is very enthusiastic in his praise of the completeness of the Crowned King mine under the superintendence of N. C. Shekels. E. H. Witherell will put from 8 to 20 men at work on a mine in the Black Hills district, from which he recently had a sample lot of ore assayed, giving a good value. He estimates that he can furnish a carload of ore per week. Diamond Joe Reynolds has purchased the right for Yavapai county of Dr. Bellev's patent process of treating ores by means of electricity. It is claimed that re-

factory ores can be treated by this process for \$1 per ton, and it is thought that the Congress ore can be successfully worked by it. C. M. Clark from Bradshaw district reports the greatest activity in the mines there. He brought in some specimens of ore from Liston's mine, which are very rich, and he reports a large body of it in sight in the mine. The Oro Bello Co. has 60 men at work in the mines and building a road. The latter will be completed by the 25th inst. The mines continue to look far better than was ever expected, and Mr. Clark says they have a solid breast of ore in their tunnel, from two to four feet in width, which will go from \$80 to \$150 per ton. The Howard mine, which was considered at first as a mere pocket which would soon be worked out, is more worthy of favorable mention at present than at any time since its discovery. With their little two-stamp mill, and water source also, its owners are piling up a good, healthy bank account, while there are thousands of dollars in sight in the mine. Their latest cleanup was \$6834 from a run of five tons.

BRITISH COLUMBIA.

THE MCMURDO DISTRICT.—Donald Truth, Oct. 13: At least one mining district in the neighborhood of Donald has not had a backset during the prospecting season now about closed, and that one is the McMurdo. In August, its discoverer, Archie McMurdo, bonded two claims to John Hepburn, and that gentleman did enough work on them to satisfy him that he had got hold of good properties. During the same month, Lowe and Dainard, who had several locations in the district, succeeded through George McCabe in getting a Calgary Co. to take hold and develop the Monitor claim for a two-thirds interest in it. A tunnel was run in 82 feet to the ledge and two open cuts made. This work proved that the ledge carried four feet of solid ore, which assays as high as \$100 in silver and \$8 in gold to the ton, besides carrying a good percentage of lead. Some fine specimens also show gray copper. Near the Monitor is the Crescent ledge, on which seven locations have been made. The assessment work on the Crescent exposed a pay streak from four to six feet in width, and similar in character to that of the Monitor. This week all the parties interested came to Donald and bonded the Monitor, Crescent, and a claim called The Southern Cross to Mr. McCabe, the bond to run for a year. That gentleman expects to place them in the hands of American capitalists by spring, as he is well known among moneyed mining men in the Black Hills of Dakota and the Cœur d'Alene of Idaho. The indications are that the McMurdo district will make a good showing next season.

ANOTHER GOOD FIND REPORTED.—A month ago a new find was made about 40 miles below Revelstoke. The ledge is over 15 feet in width, and carries gold and silver in galena—assay returns give \$38 to \$80 in silver, \$2 to \$3 in gold to the ton, and 40 per cent lead. The camp is easily accessible, as the claim stakes are within a few feet of navigable water on the northeast arm of Upper Arrow Lake. The owners, Messrs. Walker, Hill, Graham, McDonald, and D. Laney, are doing development work.

COLORADO.

NOTES.—Georgetown *Courier*, Oct. 20: A tunnel is to be driven to drain and work the Bush lodge, Myers Bros. have two feet of ore on the Mineral Chief. Several new properties on Silver creek are shipping ore. The Alunde is making weekly shipments of high-grade ore. Nearly 100 tons of ore a month comes over the new Silver creek road. An ancient mine has been discovered on Bar Mountain, Socorro county, New Mexico. The mines of Leadville are outputting about 1000 tons of ore daily. The California mine in Gilpin county has the deepest shaft in Colorado and in the 1800-foot level the ore body is from 3 to 11 feet wide and of good-milling grade. The fact that the best mines are found where dykes of eruptive rock are most numerous, confirms the theory that the mineral is derived mainly from igneous rocks. Charley Sherman is spending a heap of muscle sinking a shaft on a dyke of diorite on D-mountain. He is down 40 feet and still a-going. Some of our old mining properties that have been idle for these many years are to be opened up. The reduction in the cost of supplies in the past few years and the reduced smelting charges, make it profitable to work mines now that a few years ago could not be made to pay.

THE ASPEN STRIKE.—Denver *Tribune-Republican*, Oct. 20: The Aspen mine, which has been the scene of so many sensational discoveries, now comes to the front with another that seems to eclipse all that have gone before. Last night a cave was struck which is 30 feet long and about 70 feet high. Lying on the wall is a bed of ore seven feet thick that is enormously rich. Some of it goes as high as 4000 ounces, and it will all average several hundred ounces. At the far end of the cave is a crevice running across the formation. This is of an unknown depth.

DAKOTA.

BALD MOUNTAIN.—Deadwood *Pioneer*, Oct. 16: There are few residents of the Hills who will not readily recall the excitement that set in about two years ago, with the mines of Bald mountain district as its cause. It was stated then, and stated truthfully, that developments to that date had served to demonstrate that the district had a virtually inexhaustible quantity of ore, and that whenever a satisfactory method of treatment was obtained, the annual output would exceed in aggregate value that of even the great belt mines, including the Homestake, Old Bed, De Smet, Deadwood Terra and Caledonia. At that time a method for economically getting the gold from the refractory ore had not been found. Since then, light has been thrown on the subject, and the Deadwood Reduction Works Co.'s leaching plant is rapidly approaching completion. Since it was definitely settled that leaching, by the Clark process, could be successfully applied, the energies of individuals and corporations have been spurred. Operations have been conducted on a scale more extensive than ever, until to-day, men familiar with the district since the first stake was driven and the first location made, as long ago as 1876, are emphatic that developments accomplished in the last 12 months exceed the total for the 11 preceding years. Ore enough is now in sight and available to keep a plant ten times the capacity of

that now building in constant operation for ten years to come.

IDAHO.

A NEW HAND-JIG.—Wood River *Times*, Oct. 17: D. W. Heaston of Deer Creek shipped from Huley last Saturday a new machine which is likely to cause many a hitherto unprofitable mine to be put on a paying basis. It is a combination hand-jig of his own invention which concentrates all concentrateable ore, and takes care of all the slums or tailings at the same operation, thus saving about 50 per cent of the labor of concentration. The miners here who have seen this new jig in operation say that it beats anything in the market, that it makes cleaner ore than can be made by any other means, and at nominal expense. The inventor has signed a contract to manufacture 50 of these jigs for \$150 each, delivered at Ophir, Col. They are to have a capacity of 50 to 50 tons of crude stuff per day.

TWENTY FEET OF GOOD ORE.—Reports from the Triumph Co. are to the effect that two veins of first-class jigging ore have been struck in the Mayleaf claim of that company and that the head of the crosscut is still in ore, although an aggregate width of over 20 feet of ore has been cut through. The ore came from 25 to 35 ounces of silver per ton, and will concentrate five tons into one. In fact, it is said to be much better, and to be almost good shipping ore without concentrating.

SMALLER MINES.—Leasers on the Clipper, across the river, D. C. Wallace and others, have about three tons of ore they will ship the coming week. The jig men—Ben Miller and partners—have worked over some ore from the Monday mine, Lookout mountain, and the returns are said to show up splendidly.

HUNTER DISTRICT.—Wardner *News*, Oct. 20: The work of development on the Morning lode is rapidly bringing it into the very front rank of mines. The lower tunnel in which work is now being prosecuted discloses a vein of galena seven feet in width, which is now shown up for a distance of 200 feet. This body of ore will concentrate at least two tons into one. It is estimated that there is in sight fully 20,000 tons. Under the able management of Martin Curran this property has been changed with two months' labor from a good prospect to an undoubtedly valuable mine.

HUNTER GULCH.—The grading for the Hunter flume is nearly completed and the work of construction will be commenced as soon as a sufficient quantity of lumber can be turned out by their sawmill, which has just commenced operations. The grading for the concentrator is being rapidly pushed for January.

EVOLUTION DISTRICT.—Big creek is gaining a good reputation from its number of fine locations that are showing up most satisfactorily as development progresses. The Blake brothers, owners of the Yankee Boy, located near the Polaris mine, shipped one carload of ore on Tuesday to the sampling works of Burlidge & Co., Cœur d'Alene City.

MONTANA.

THE MAGNA CHARTA TO START UP.—Inter-Mountain, Oct. 17: It was learned from Supt. Wm. E. Hall this morning that arrangements are being made for resuming operations on the Magna Charta mine, which has been lying idle for the past 12 months. He expects that work will commence on Monday. At the same time the old 20-stamp mill will be in dropping on ore. Supt. Hall is busily engaged in providing timber and workmen for repairing the damage to the 60-stamp mill by the recent fire. From present indications it looks as though the old reliable Alice mines and mills will be working on their former grand scale.

THE BELLONA MINE SOLD.—Yesterday the sum of \$65,000 was deposited in the First National bank of this city to be paid to Silas F. King and James A. Murray for the purchase of the Bellona mine by the Parrot Company. This sum is to be handed to the gentlemen named on the arrival from Washington of a mining patent which has been applied for. The Bellona lode joins the Parrot Company's mines immediately on the south.

A GOOD PROPERTY.—Butte *Inter-Mountain*, Oct. 13: Maj. Hornbrook and the Detrick Bros. have struck a pretty rich thing in the Carrie mine, located in the rear of Patrick A. Largey's residence on Broadway, and upon which they have secured a bond for \$50,000 for one year. The workings are not more than 80 feet deep and a level is being run at 50 feet in the shaft, in a westerly direction, where there is a fine body of ore between 3 and 4 feet wide. During four days of last week 23 tons were taken out which assayed 162 ounces silver and 59 in gold. The major thinks he has a property which will make him rich. A new hoisting engine is being placed on the L. Plata mine.

HARVEY DISTRICT.—Phillipsburg *Mail*, Oct. 17: John M. Long arrived in town Friday evening from Harvey district, about 30 miles from here, where he is developing some properties. Mr. Long reports that district as likely to become one of the most prominent in the Territory. The various mining locations show up exceedingly well, though little work has been done on any of them. Gold is by far the prevailing metal of the district, and the ore contains little silver or copper. The country is extremely rugged and mountainous and has all the indications of a rich mining region. The beauty of the district, according to our friend, is indeed remarkable. It will be necessary for considerable road-building to be done before any very heavy work can be prosecuted. While but 30 miles from here in a direct line, it requires about twice that amount of travel before it can be reached, going by rail as far as Bonita (about midway between Drummond and Missoula) and thence on horse-back about 15 miles in a southerly direction to the mines.

NEVADA CREEK PLACER MINES.—Mining *Review*, Oct. 6: In this extensive property there are, at present, ten men employed working on reservoirs, ditches, etc., and getting things into shape for a long season of placer-mining next summer. This force will be kept employed as late this fall as the weather will permit. As soon as practicable next spring the company will start a large force of men at work in the diggings, and unless the season should be an exceptionally dry one it is thought that the giants can be kept at work between four and five

months, when, judging from former cleanups at the end of the mining season, the product of the season's work will probably be astonishing. The gold obtained from these diggings is for the most part very coarse, and conservative experts have pronounced the entire 803 acres embraced in the place as profitable mining ground. The company has now something like 25 miles of water ditches in operation, to which extensive improvements are now being made, and additional ditches and reservoirs are soon to be added, which will make of these diggings one of the most valuable placer mines in the world.

AFFAIRS AT THE BLUEBIRD.—Inter-Mountain, Oct. 19: Supt. Booram of the Bluebird reports the mine to be looking better than ever. The ore bodies continue to improve as well as the assay value, which is making a most flattering showing. The bullion of late has been running as high as 820 ounces fine, and averages 800, which makes the Bluebird silver the purest in the camp. Mr. Booram states that President Van Zandt is highly gratified at the condition of affairs at the Bluebird.

NEW MEXICO.

AROUND KINGSTON.—Kingston *Shaft*, Oct. 16: The Comstock has let out a few men, until they can get the mine better drained. The Lady Franklin is preparing to sink deeper, but has trouble with her pumps. O. P. Boger, after taking out quite a lot of rich ore on his Hornet lease, has sold out to his partners. The mines on the Bonanza Hill are troubled with water, and are working fewer men and shipping less ore than usual. The Black Colt is not working any men; 100 much water for economical working. They are preparing to put in a steam pump and hoist. The Hornet is filled with leasers. Every place that has a show of ore has somebody at work on it. Mr. Geo. W. Grayson says the mining outlook at Hillsboro is constantly improving, and his own property is looking well; the deeper they go, the richer the ore gets.

OREGON.

SALES PENDING.—Bedrock *Democrat*, Oct. 15: Negotiations are pending for the purchase of several mining properties in the southwestern portion of Baker county and the sales will probably be consummated within the next few weeks. From present indications the outlook of the mines is very encouraging and there is every reason to believe that the coming of another spring will mark an era of activity in mining in Baker county never experienced before. The properties are all being fully developed and their permanency is no longer a question. The universal judgment of mining men is that it is a great mining district of unlimited wealth and will surely make this fact known to the world.

THE CONNOR CREEK MINES.—Capt. Joseph Myrick, superintendent of the Connor Creek mine, came to the city last Sunday with a large amount of bullion and shipped it to headquarters at Portland.

UTAH.

PARK NOTES.—Record, Oct. 19: The Russell process at the Marsac mill will be running in full blast in a week or two. The Woodside continues to look like a bonanza, and regular ore shipments are going forward. The machinery at the mouth of the Ontario three-mile drain tunnel is in place and nearly ready to be started up. Samples of ore taken from the West End tunnel show that the recent strike is a valuable one. The Wasatch marble quarries at the head of Snake creek are to be worked again, this time on a larger scale. Arrangements have been perfected whereby the Whitehead group, lately bonded for \$18,000 by J. A. Lenzi, will be developed through Slagle's Great Eastern tunnel.

ORE AND BULLION SHIPMENTS.—During the week Crescent shipped 160,000 pounds of concentrates. For the week just ended the Mackintosh sampler received 326,890 pounds of Ontario ore; 114,740 of Daly; 142,190 of Woodside lease, and 6590 of Southern Tier ore; total, 589,510 pounds. The product of Ontario bullion for the week was 42 bars, containing 21,351.79 fine ounces of silver. Yesterday 10 bars of Daly bullion, 70,664 fine ounces of silver, were shipped from the Marsac mill.

WASHINGTON.

ALLEGED GOLD DISCOVERIES.—Spokane Falls *Herald*, Oct. 8: A *Herald* reporter has been diligent in his search during the past week for additional facts regarding the alleged gold discovery as published in our last Sunday's issue. He had the good fortune to meet two experienced miners who had visited the locality named and spent some time there; their report is not at all flattering, in fact there is no cause for excitement, as they declare positively that what the former parties took for gold is not that metal, but a species of yellow mica. As the discoverers had never done any mining it is quite probable that they made the very common error that any inexperienced prospector is liable to make, and instead of the genuine article they found a quantity of "Pilgrim gold." While investigating this report our reporter ascertained the facts of another gold discovery near Little Baldy, about six miles from the city, which we give as we received it. Though we have seen some of the quartz and the assayer's report, we can vouch for nothing more. Some time since two prospectors named Doak and Detamore found quartz near Little Baldy; they had the surface rock assayed, and it gave a return of \$3.50 per ton in gold, with a trace of silver. Desirous of prosecuting development work on the two claims they had staked out, they enlisted Jasper Geesey and two other parties of this city, who have agreed to furnish all necessary supplies and capital. Whether or not gold exists in paying quantity near Little Baldy, the *Herald* is not advised.

IRON AND COAL.—The drill has already demonstrated that there is an abundance of the best quality of coal underlying Cle-Elum, and the pick has exposed mountains of the finest quality of iron within two miles of that city. Transportation facilities are already there, and it only remains for capital to establish the great rolling-mills and iron-works. Within the coming year there is but little doubt such works will be built, and Kittitas county will be the greatest manufacturing center in the Pacific Northwest.

Remittance should only be made by Bank Draft, or by P. O. Money Order, payable to the order of C. A. STETEFELDT.

WANTED.

To Buy or Lease Graphite Mine or Location. Address: PASADENA MINING & DEVELOPING CO., PASADENA, CAL.

STORAGE

We have some extra room suitable for storage purposes, which we will let on very reasonable terms. DEWEY & CO., 220 Market Street, San Francisco, Cal.

THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

Mining Turbine Water Wheel.**

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

**THE RAND DRILL COMPANY,
23 Park Place, New York.**

We are now so situated with our new works as to offer to the miners of the Pacific Coast SMALL AIR-COMPRESSING PLANTS at such prices that almost any small mine can afford to put in power drills if they have none in use.
By our NEW AND PATENTED SYSTEMS (by which the duty or performance of drills is not reduced with use) it is no longer necessary PLANTS IN THIS COUNTRY, and has patterns for all sizes up to 40-inch diameter of cylinder.
In respect to capacity, SPEED OF DRILLING, perhaps it is in order to say that in EVERY AUTHENTICATIVE CONTEST for speed yet initiated, the RAND DRILLS have, without exception, BEEN VICTORIOUS. This fact, coupled with another important one, that the drills use much LESS AIR and cause LESS REPAIRS, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.
Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Oct. 25, 1888.

SILVER—The market the past week gained in strength, with quite an advance made on Tuesday in sympathy with higher prices abroad and also in New York. The demand with us is not of an urgent character, for large export buyers are only tempted by prices below the New York and English parity. A sale of silver was made yesterday at 94 55/100 cts. for export, although the bids made were at 94 1/2 cts. It is quite likely that ready sales cannot be made at over the latter figure. The output of silver bullion on this coast is light, and no perceptible increase is looked for until the mining companies in Nevada again commence to crush ore, which will be next month, in the Comstock district, but in other districts of the State no decided increase in the crushing of silver-bearing ore will take place before early in 1889. The fact must not be overlooked that though more ore will be crushed by the mills in the Comstock district this coming winter than for several years past, still the percentage in silver will be less. This opinion is based on the latest and most reliable reports from Virginia City, which state that the work going on in several of the mines make it certain that what is called the Red Lode is a veritable lode, rich in mineral ore in which gold predominates, and to this lode, for some time at any rate, will the mills have to look for ore to crush. The work being done in one of them, West Con. Virginia, already demonstrates that the lode is much more valuable than claimed by some, and with further prospecting work it is claimed that there will be a revival of mining on the Red lode, which lies west of the Bonanza lode, equalled only by the "bonanza days."

The market closed weaker to-day in sympathy with a decline of the London market at 44 1/4 d. Ours is quoted at 94 1/2 @ 94 3/4 c.

QUICKSILVER—The market has held to strong prices throughout the week. A quicker domestic demand from the mines is reported, with the more distant districts drawing quite heavily. It is claimed by many that the consumption on this coast is increasing. The export movement is of a steady character. The local market is quoted at a decline of 2¢ on last week's prices.

LEAD—The market has been subjected to Eastern influences and consequently prices receded, but afterward gained in strength with a slight advance reported. The New York market broke on Oct. 19th under a confirmation of the report that Nathan Currier & Co. of that city had suspended. This firm in connection with Corwith & Co. of Chicago worked the corner in lead, and their suspension naturally caused a stampede with the bull element. Under a strong bear raid October lead was beaten down to 40¢. This was followed by a sale the next day at 39 7/8¢ per 100 lbs. These low prices brought in buyers, causing a stronger market to obtain.

TIN—The price for prompt shipment is said to be strongly maintained for tin plate. The sales so far, it is reported, aggregate over 90,000 boxes at from \$4.05 to \$5.15 per box. In pig, the market is without any special features to note. For tin plate on spot the demand is slow. The position of tin abroad is very strong. Late mail advices from London report as follows: "The value of Straits tin during the first quarter of the year ranged between £160 and £170, and while these unusually high prices stimulated production, they checked consumption to such a degree that the deliveries in the first four months averaged 1225 tons per month. With the fall in the price to £75 tons at the end of June the demand rapidly increased until the total stock at the end of last month stood at 13,419 tons, thus showing that 10,265 tons had gone into consumption since the end of April. But since the last statistical return was published, the position has again improved, and the stock in London at the end of the first fortnight in September was further reduced to 2700 tons."

COAL—The importation of coal both at this port, San Diego, and San Pedro continues free, with a large proportion sold to arrive. Contrary to expectations in certain quarters, prices do not advance, while, on the contrary, there appears to be an easier feeling. The action of the Southern Pacific railroad in selling all their employees their coal at cost price will have some effect on the market for house coal. The coal yards in this and adjoining cities are reported to be full.

Since writing the above a leading importer reports an advance in Cumberland and Egg to arrive, owing to higher freights abroad.

IRON—The market for spot is active. The last sale of Oregon reported was 1000 tons at \$30; since then none has been sent here, it being used in Oregon. American soft is higher. There is no Gleanerock or Eglinton in the market. Spot prices for foreign iron are below the parity of the supply markets.

BORAX—The market is quiet with quotations nominal.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Oct. 25, 1888.—The following are the closing prices the past week:

	Silver	Silver in London	New York	Copper	Lead	Tin
Thursday	43	033	\$17 50	\$4 25	\$23 40	
Friday	43 1/16	93 15/16	17 60	3 95	23 50	
Saturday	43 1/16	93 15/16	17 45	3 97 1/2	23 25	
Monday	43 1/16	94 1/16	17 35	4 02 1/2	23 25	
Tuesday	43 1/16	94 1/16	17 45	3 97 1/2	23 10	
Wednesday	43 1/16	94 1/16	17 45	3 95	23 00	

The market closes as follows: Quicksilver moved to 65¢, following the London advance to 96¢. Copper is without interest. Lake Ingot is nominal at 17 1/2¢; casting brands, 16¢@16 1/2¢. Liberal buying orders followed the collapse of the lead corner. The closing price is from \$3 90¢@4 for spot. Borax is steady, with moderate sales. California refined is quoted at 8 1/2¢@8 3/4¢; concentrated, 8¢@8 1/2¢. Pig iron is firm. Tin is firm with a fair inquiry.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

Tin firm, advancing 25 points on spot, and 20 to 30 on futures, Copper unchanged. Lead weak.

Spelter dull. Pig iron, dull, but firm. Large consumers have all the iron they want for the present, and makers are busy delivering it to them, so that small lots comprise the bulk of the business. Manufactured iron, without being specially active, there is a good business doing, and prices are steadily maintained. One thousand tons of skelp was taken at \$1.95, although sellers are firm, and ask 2¢ for the general run of orders. Old rails, negotiations are in progress for a large lot of T's and D. H.'s mixed, with about \$2.4 as the probable price. Scrap iron, firm and in good demand, at full prices.

Prices generally ruling for metals not regularly dealt in on Call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt deliveries. Au-trailian Tin, @—, Biliton Tin, @—, Banca Tin, @—, Baltimore Copper, \$16.00@—; Orford Copper, \$16.00@16.25; P. S. C. Copper, @—; Foreign Lead, \$5.00@5.25; Foreign Spelter, \$5.40@5.50; Antimony, \$9.75@13.50.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HOSE BRIDGE.—Henry Tucker and Patrick J. Keegan. No. 390,920. Dated Oct. 9, 1888. This invention belongs to that class of bridges or frames which are used for carrying hose over railway tracks in the streets of cities, whereby interference with the travel of the cars is avoided. This bridge is made of vertically movable sides composed of telescoped pipe sections. The sides are connected so that they shall operate simultaneously under the pressure of water introduced to one of the sides from the fire engine. The hose is coupled to that side and supported by the other side, and when the water is turned on, the pressure on the telescoped pipe sections, of which the sides are composed, forces them out and thus raises the bridge and hose. Suitable supports are provided to hold it in an elevated position.

MOTOR.—George F. Wells, S. F., assignor of one-half to Manley C. Lawton, Staten Island, Cal. No. 390,929. Dated Oct. 9, 1888. This motor is designed to receive and convert an intermittent or irregular power—such as from a treadle or treadles—into a steady, continuous motion. The main object of the invention is to provide a simple and delicate motor specially adapted for use in automatic musical instruments and transmitting the power of the treadles to the music-roll. The motor consists in a pulley to be driven, a friction pulley engaging it and carried by a pivoted bracket, a

power spring for turning the friction pulley in one direction and connections with the treadles for alternately winding the spring and pulling the bracket to disengage the pulleys, and relieving the spring and bracket to effect the re-engagement of the pulleys and the rotation of the main pulley under the recoil of the power spring.

STEAM BOILER.—P. F. Dundon, S. F. No. 391,359. Dated Oct. 16, 1888. In a former patent issued to Mr. Dundon in August, 1886, he showed a boiler composed of two separate and independent shells, one constituting or containing the furnace and the other containing the flues to return the heat to the front, and in connection with these two separate shells, flues and furnaces, return passages were employed on the sides. In the present invention he employs a single boiler-shell, with a casing or jacket surrounding it, connected at the sides by an internal partition, which divides the jacket into an upper and lower compartment. The boiler has a furnace at one end and a combustion chamber at the opposite end, with flues or tubes extending through from the combustion chamber to the smoke-box. Chambers or compartments extend along the exterior of the lower sides of the boiler to the furnace end, forming an extension of the smoke-box, through which the products of combustion pass, and there is a second chamber or compartment with which the first one communicates, said second compartment extending over the top of the boiler to the smoke-stack, and separated from the lower compartment by the horizontal internal partition. This partition terminates a short distance from the back end on both sides, and the outlet to the stack is formed at the front end above the smoke-box. The hot gases and products of combustion are passed first through the main flue to the adjacent combustion chamber, thence through the internal tubes to the furnace end, passing thence into the lower compartment. The products now pass along the lower compartment to the space at rear between the open ends of the partition, through which space they pass to the upper compartment and are finally led along that to the outlet of the stack.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

GRAY'S HARBOR COMMERCIAL CO., Oct. 20. Object, to deal in lumber and carry on a general logging and lumber business in Washington Territory and elsewhere. Directors—Charles S. Holmes, Charles F. Talbot and William H. Talbot, William J. Adama, Charles Hanson, Edward M. Herrick and George W. Watson. Capital stock, \$150,000.

SANHEDIN MILL AND LUMBER CO., Oct. 23. Capital stock, \$120,000. Directors—W. O. Murdoch, Dwight W. Grover, Edward Foster, George L. Fitch, Frank D. Scott, Frank Markey, L. F. Grover, C. M. Miller and W. P. Chase.

FIDELITY MUTUAL AID ASSOCIATION, Oct. 20. Directors—W. F. Gibson, H. D. Wallace, E. F. Card, J. L. M. Shetterly, L. D. Little, W. F. Hubbard, J. E. Shuterly.

THE International Smelting Co. of El Paso have raised their capital to a half-million dollars. They will build more reduction works.

THE Copper Queen mine, Arizona, paid a dividend of \$70,000 on the 1st inst.

Mining Share Market.

The market has by no means been steady during the past week, though it has been at times strong. There has been fluctuation from day to day, though the general tendency has been rather upward. The brokers are pleased at the unwonted activity, as it has given them more to do than for months past. As to work on the Comstock, the *Enterprise* says:

Never before in the history of the Comstock have there been seen so many different mines that were simultaneously yielding paying ore. Ore is being taken out nearly all along the line of the Comstock—there are only a few breaks—and there are also several outside mines that are now producing considerable quantities of good milling ore. The new body of ore found on the line between the Savage and the Halo and Norcross is a fine one. An eight-foot vein of \$50 ore would of itself constitute a big mine in Idaho, Montana, Arizona and other mining regions. The new west ore body, on the 300 level of the Best and Belcher, though not yet showing up as well as the new recent strike in Savage and Norcross, bids fair to lead to something of value.

Other new developments will probably soon be heard from—are now about ripe—which, with the resumption of ore reduction at the mills on the Carson river, will keep the market climbing.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Lexington, Oct. 13, \$25,000; Hanauer, 17, \$1600; Crescent, 17, \$4900; Germania, 17, \$2258; Hanauer, 14, \$3450; Germania, 14, \$1721; Hanauer, 13, \$3700; Howard, 17, \$1700; Blue bird, 17, \$12,000; Con. California and Virginia, 20, \$62,302; Germania, 20, \$1733; Crescent, 18, \$3600; Hanauer, 19, \$4100; Germania, 19, \$1871; Mt. Diablo, 24, \$7153; Nevada Queen, 24, \$20,000.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports files of scientific and mechanical publications etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

THE RUSSELL PROCESS COMP'Y.

C. A. STETEFELDT, President.

NEW YORK OFFICE, 18 BROADWAY
Room 708.

DELINQUENT SALE NOTICE.

Gray Eagle Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Placer county, California. NOTICE.—There are delinquent upon the following described stock, on account of Assessment (No. 3) levied on the 4th day of September, 1888, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificates.	Shares.	Amount.
D. Bowers.....	73	500	\$25 00
Wm. Mc Gowan.....	379	10	2 40
Theo. Weigel, Trustee.....	364	8	40

And in accordance with law, and an order of the Board of Directors, made on the fourth day of September, 1888, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the Company, room 9, No 37 Pine street, San Francisco, Cal., on Tuesday, the thirtieth (30) day of October, 1888, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

O. H. BOHART, Secretary.
Office—Room 9, No 37 Pine St., San Francisco, Cal.

The EXPLORERS' and ASSAYERS' COMPANION.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

By J. S. PHILLIPS, M. E.

Price, \$0.00 post-paid. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulae as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

"WHEELER PROCESS"

—FOR—

Working Refractory Gold and Silver Ores.

We are now prepared to receive Ore at our Testing and Mining Mill, Meriden, Conn., in sample lots of 500 pounds, to be worked by the Wheeler Process, where we have succeeded in saving 90 per cent of the metal contained in the ore.

We work sample lots free of charge and report results. THE NEW CHEMICAL GOLD MINING CO. Box 939, Meriden, Conn.

WANTED,

If cheap for cash, some good, serviceable Second hand

Amalgamating Pans and Settlers;

Also a Second hand Halfday or Huston Elevated Tramway, complete except woodwork, and not less than 3000 feet long, delivered at nearest railroad station. Give full particulars as to price, size, weight, make and condition. Address,

Centrifugal Roller Quartz Mill.

ORE CRUSHER

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, hearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

VOLUME LVI.
Number 18.

Sulphuric Acid Manufacture.

One of the radical changes mentioned by Mr. Adams in his paper from which we have quoted in the last two numbers of the PRESS, is the employment of iron vessels to transport the acid. The use of iron vessels in this connection opened up a new avenue for that metal, viz.: for use in place of glass or platinum as concentrating apparatus. Experiments to conduct the details in this direction have been made almost wholly by sea-board works, handicapped by locality, and forced to reduce the costs in manufacture to meet competition from more modern works erected at points of consumption.

One of the earliest examples of the use of iron is shown in Fig. 7, a type of pot in general use for the manufacture of nitric acid during the last 50 years. It was about 1869-70 that experiments were made with this pot, in the manner of the glass-retort procedure, viz.: filling the pot full of pan-acid and boiling until sufficiently condensed.

In the drawing of Fig. 7, the pot is represented as built entirely within the walls of the fire-place, but the earlier experiments were with naked tops, therefore subject to greater corrosive action than the sketch would indicate.

Another experiment attempted about this time, as an outcome of the former test, is illustrated in Fig. 8. A cast-iron cylinder was built into a chimney-like furnace-space, so as to confine the heat closely to the metal from bottom to top. The cylinder was closed with slabs of non-corrosive stone (such as are employed for the fronts of nitric stills), and the space inside was nearly filled with saucers of porcelain, set one upon the other from the bottom. Pan-acid

Fig. 8.

CAST-IRON CYLINDER, 1870.

Fig. 7.

APPARATUS EMPLOYING IRON POTS IN MANUFACTURING SULPHURIC ACID, 1869-70.

ran into the top sancer and spread itself thinly over the sloping bottoms of the saucers until it was taken from the exit-pipe in a sufficiently concentrated condition (66° B.). The outlet for

chimney-gases, the care of the concentrated vitriol, and other details, will be understood.

It is plain that a cylinder evenly and strongly heated at all times means an inner radiation

which will very rapidly drive off all the water from the thinly flowing liquid. So great an evaporative surface with so small a construction-cost, promised a most successful result;

but difficulties not connected with the work itself, though involving a change of base for the experimenter, brought the experiment to a close. It is here noted to show how closely success and failure are allied. In the hand of a practical man, allowed the privilege of experimenting, this apparatus should have been made an unquestionable success, the germ of what we now know to be successful working being certainly shown in this construction.

It is unnecessary to detail many of the changes which followed the above plant, the next decided step being shown in Figs. 9 and 9a. (see page 297.)

This design also closely follows the successful platinum apparatus of that time, as this reproduction of the original drawing will prove. The action of this form of still in service will readily be understood, the construction being modified from time to time, so that the still was finally inclosed in the furnace, the fire surrounding it completely.

THE LIVERMORE COAL MINES.—Speaking of the new coal mine, the *Livermore Herald* says: The plant for the Pen Daren incline is at the coal mines, arrived last week, and is now being hauled by T. E. Knox. The plant consists of a large hoiler and an engine and hoisting machinery. It will soon be in position and working order, when this incline will be pushed down into the coal. The Pen Daren vein is eight feet wide. The quality is not quite equal to that of the Richards vein, but the quantity is greater. Both veins will be worked by the Livermore Coal Mining Company.

A FAINT comet, with a nucleus and tail, was discovered by Mr. Barnard at the Lick Observ-

atory October 31st, at 4:51 A. M. Its position was right ascension 9 hours and 46 minutes, south declination 15 degrees and 22 minutes. Motion, northeast.

CORRESPONDENCE.

We admit, unadvised, opinions of correspondents.—Eds.

Kern County Mines.

EDITORS PRESS:—I have received from your office a marked copy of the MINING AND SCIENTIFIC PRESS, dated in May, in which my attention is drawn to an article which seems to have been written from "Kingsville," wherever that may be, in which attention is drawn to the Sumner mine, or the "Big Blue," as it is called; and in the article it is claimed that the work remains idle because there is no pumping machinery for draining the mine.

I have made diligent inquiry regarding the mine of men who stood in the stopes for years, and am compelled to say that the article is in a measure misleading.

There is a drainage tunnel which discharges into Kern river at high-water mark. A shaft has been sunk in the bed of this tunnel 150 feet deep, and some stoping has been done as low as 60 feet below the level of the drainage tunnel; but of the \$3,000,000 which the mine is supposed to have yielded, probably not one-fourth of one per cent came from below the level of the drainage tunnel.

Litigation is the bane of California gold mining, and how much it may have had to do in maintaining in idleness what was once the best quartz-mill in the State I would rather leave for others to declare.

J. P. Jones once invested heavily in the mine, and by some means was divested of his title. The present holders, or at least successors, attempted to run it, but found results so unsatisfactory that it was leased out to an association of tributaries—men who had worked the mine and knew the secret causes of failure. These men are said to have been making money "hand over fist," as the saying is, when the holders suddenly terminated the lease and the mine stopped.

The difference in the plan of working may throw some light on the different results. The vein is, perhaps, one of the most complicated in the State. The main ledge is about 100 feet wide, and runs about 20 degrees to the north of east. What is known as the west vein comes in directly from the north and enters within the walls of the main ledge; and from there to the south end of the principal working is separated from the main ledge by a thin casing, maintaining its peculiar characteristics throughout. It is from three to five feet wide, and carries none but high-grade ore. Another similar vein known as the Lady Belle comes in from the southwest. Carrying between the angles of these two side veins is the Beauregard, which has not yet been traced to a connection with the system. These three feeders carry high-grade ore. Then there is within the walls of the main ledge a stratum of good rock ten feet wide, and another stratum of fair rock 14 feet. The tributaries believed that the remaining 70 or 80 feet of vein matter was of too low a grade to pay under the present mode of treatment; and, therefore, unlike the other management, left it in the mine.

I have lately learned that there are vast bodies of ore left in these tributary veins, above the level of the drainage tunnel.

The foundry, machine-shop and 80-stamp water-mill are still intact, though the hoisting works were burned soon after the mill was shut down. CYNAS.

Kernville, Oct., 1888.

Mining-Law Suggestions.

EDITORS PRESS:—The interest you are taking in the mineral land question is to be appreciated by every miner of every mining State and Territory. It is an outrage, and not only that, but a serious loss to the nation, this having the mineral lands gobbled up by speculators under agricultural claims. In an article published in the Press of October 13th, you say "it might be expedient that the mineral lands should be open to all citizens at a uniform price, say \$10 per acre." Now I want to know why the miner should be taxed \$10 per acre. The farmer gets his land at \$1.25 per acre. There is a general feeling that the miner should have the heaviest tax possible put on him, and at the same time he is furnishing the blood of trade, commerce, and prosperity of the nation, and the miner takes all the chances of profit. The prospecting miner is really the producer, as he keeps up the supply of the precious metals; but the way the mineral lands are going, there is soon to be a falling off of gold and silver production, from the simple fact the Government is lending its power for fencing the prospecting miner out. Othello's occupation will soon be gone, and then the Government will be crying for gold. One will say the mineral will not be lost by being fenced in in 160 acre tracts, and yet it is, from the fact that the rates put on the lands shut the prospector out. It may be a mark of advanced civilization to thus kill the production of the precious metals—viewing things in that light, I would say Amen; but as long as the world holds to gold as the standard of all values, it certainly is the wiser part for the nation having a mineral domain to foster production, rather than to lend its aid for destroying it. COSMOS.

Shasta Co., October, 1888.

A Bedrock Flume.

The Idaho World says: An Eastern company has secured a large amount of ground in Grimes and Granite creeks which will be worked through bedrock flumes. Arrangements for commencing work this fall are being perfected, as two members of the company who visited the ground are well pleased with it and realize that millions lie covered beneath the sands. The people of the Basin have been hammering away at capitalists for 20 years or more to open up the creek beds by bedrock flumes, and it is a fact for congratulation that some of them have been made to realize that of all industries to be inaugurated, the working of the beds of the creeks will prove most profitable.

As has been repeatedly told, the beds of all the creeks of the Basin were worked when labor was \$7 and \$8 per day, water \$1 per inch, tools, lumber, provisions and everything else proportionately high. From eight to ten feet of top dirt had to be wheeled off at enormous expense so that pay streaks of from one to three feet could be got at. This was shoveled into small, short boxes, through which a good deal of gold passed and was shoveled out in the tailings. Narrow streaks of rich dirt were wheeled off with the strippings, because it would not pay to save it. Nothing but the very richest of ground would pay to work. As soon as the creek beds were hastily run over, the miners of the bars and hillside commenced dumping into them. These tailings all contain gold, and, as they could be rapidly worked through flumes, would pay, not counting the acres of new ground that would pay handsomely now with small boxes if it could be got at.

There is ground enough in Grimes, Granite, Opbir, More and Elk creeks to keep several companies at work for 20 or 30 years, and every one of them would yield millions of money. Of course it requires large capital to start these enterprises, but that matters not, as all who know the ground know that the profits will be beyond those of anything entered into in Idaho Territory heretofore.

We have peculiar advantages here for flume mining. The creeks have good fall, water in sufficient quantities, good roads and timber in abundance. Portable sawmills could easily be moved to any desirable point and lumber cut wherever needed. As soon as the Granite Creek company gets its flumes up to paying ground, which can easily be done by next year, the returns will be so handsome that other companies will immediately secure all the ground in the other creeks, and there will be a revival of all classes of business not witnessed since the bright days of the '60s, when Boise Basin was known far and wide as the great placer-mining district of the West. Ground that has yielded so many millions must contain millions more; and, comparatively speaking, it will require but small capital to get at it. We know this because 10,000 men, most of whom were not practical miners, rushing and hastening to work the best ground, necessarily left a large amount that would be considered very rich to-day, and did not save a very good percentage of that which they did work.

That one company has been formed to work by the flume process is an occasion for rejoicing among our citizens, as others will follow in rapid succession until hundreds of men will be added to our laboring population.

WARDNER'S NEW CONCENTRATOR.—The just completed concentrator of the Spokane Concentrating Co., which has been erected for the concentration of the ore of the Luma and Last Chance mine, started up yesterday, and the run so far has been very successful. The concentrator is located at the head of Main street, Wardner, on Milo creek, right at the base of the Luma and Last Chance mine, with which it is connected by a substantial tramway, on the same principle as that used in the Banker Hill and Sullivan mine, and with a capacity of 288 tons per day of 24 hours. The concentrator is a perfect piece of mechanism, substantially built, and designed so that it can with small additional cost be increased as the output of the mine justifies. It is built on the most approved plan, and its present capacity in ore is about 40 tons per diem. The tramway is some 1800 feet in length, the vertical height to the level of Tunnel No. 1 being 800 feet. The cars used have capacity for a ton of ore, the ore being deposited in a series of hives at the summit of the concentrator, from which it passes through the various processes of concentration, coming out ready for sacking on the loading platform at the base of the building. The clearing for the site of the concentrator and tramway was commenced on July 20th, and the first timber was laid on the lot of August. The whole work has thus been completed in 50 days—by far the quickest piece of concentrator building-work so far accomplished in the Coeur d'Alenes. The machinery of the concentrator and the tramway was supplied by the well-known house of Frazer & Chalmers of Chicago. Mr. A. M. Esler superintended construction and was ably assisted by his assistant, W. Richard O'Neil. The lumber contract was executed by the Cameron Bros. of the Milo sawmills.—*Spokane Falls Review*.

SILVER IN ALASKA.—The Alaska Free Press says: It begins to look as though Alaska would soon come into prominence as a silver-bearing region. It is known that the Copper River country contains rich silver ores, as well as cop-

per. Glacier Bay has her silver deposits, although as yet undeveloped, and now a little development work on Sheep creek shows up good veins of silver ore. This is one of the best indications that go to show up a permanent mineral-producing region. At no time since the first discoveries of mineral here has the mining outlook been as propitious as at the present time. One of the weaknesses of our old-time prospectors has been romance of rich placer digging and ores yellow with gold existing in inaccessible places, and to search for these they have discarded development work on promising claims, simply because a fortune was not visible on the surface, and have overlooked ground near at home because they thought it too accessible to pan out well. But these accessible places are now being prospected and development work going on on prospects that were heretofore classed as worthless, and some rich strikes are being made.

An Asbestos Bonanza

In the Mohave country has recently been discovered the largest and most valuable deposit of asbestos in the known world. Alex J. Trueman, who a day or two ago arrived from the Mohave country, passing up along the proposed line of the Carson & Colorado extension from Keeler to Mohave, is enthusiastic in regard to the mineral resources of what has heretofore been looked upon as a region worthless, except for its deposits of borax, soda, salt and like surface wealth. Mr. Trueman says the asbestos recently discovered near Oro Grande is as fine as has been found in any place in the world, while the amount of the mineral in sight in the vein far exceeds that to be seen in any other known locality. The vein is about 25 feet in width and lies in plain sight for a distance of over 1500 feet. It is traceable for over 3000 feet by means of croppings that occasionally come to the surface.

Unlike many other asbestos deposits, this vein is almost unmined with hornblende and tremolite. The fibers are long, silky and of a beautiful pearly luster. The fibers are as tough as flax, and might easily be spun into a fine thread. In short, it is the genuine amiantus of the Greeks. Asbestos is a Greek word, which means indestructible, and amiantus (also Greek) signifies unpalatable. In this word—unpalatable—we have a hint of the use to which the mineral was put. By the Greeks the amiantus was woven into cloth in which were enveloped human bodies that were to be cremated. Thus they preserved in the folds of the "indestructible" and "unpalatable" cloth the ashes of their dead friends, free from admixture with the cinders and ashes of the fuel used in the process of cremation. From the asbestos of Mohave might be woven the same indestructible cloth. This is of interest to many at this time, as cremation of the dead is again beginning to be practiced.

Besides this fine silken article which occupies the central parts of the vein there are outside (as a sort of wall rock) great bodies of what is called rock cork (which is a variety of asbestos that is as easily cut and as light as ordinary cork, readily floating in water), "rock-heaters" and "rock wood," which are very similar to the rock cork. In the vein and along its borders are inexhaustible quantities of ordinary asbestos, such as is used in crating steam pipes and the like. The amiantus meanders through the gorges natural in veins from one to four feet in width. It can be torn out with the naked hands in "banks" over a yard in length, and just as taken out is superior to the best prepared article from Tarentaise in Savoy. All about the lode the country rock is made the less asbestiform.

That which will probably be of great use to our furnace men in their smelters is the fine talc which is found in the same neighborhood in immense quantities and of all varieties. Talc is able to stand the strongest fires without injury. Mixed with asbestos there might be manufactured from the talc excellent melting-pots and fire-bricks. When the Carson & Colorado taps the Mohave country we may easily and cheaply obtain a supply of hot talc and asbestos.—*Virginia Enterprise*.

CENTER OF THE UNITED STATES.—Very few people know where the center of the United States, east and west, is. It is scarcely half a degree east of San Francisco. People have always thought of San Francisco as on the very remote western edge of the United States, and yet Alaska, which is a part of the United States, extends within a trifling fraction of so many degrees west of San Francisco as San Francisco is west of Portland, Me. It extends within 40 miles of Asia.

MEXICAN COAL.—The Southern Pacific Company is experimenting on the southern divisions of its system with Mexican coal, which, if satisfactory, will result in a largely increased consumption of that article. It has hitherto been considered inferior for engine use. New grades adapted to this particular kind of coal will have to be provided.

THE EXCHEQUER Mining Company has elected the following officers for the ensuing year: Chas. Hirschfeld, Pres.; M. Rehfsch, Vice-Pres.; W. S. Hobart, Max Jaffe and C. F. Smyth, Directors. C. E. Elliot was re-elected Secretary and A. C. Hamilton Superintendent.

Seven Devils.

We hope our friends will not be unduly startled at the announcement of our topic. This is not a ghost story or hallucination, but real fact.

In the course of human events, about the last of August, it became our lot by choice to go within about four miles of the oft-heard-of monsters. And it is truly an august presence even at that distance. They consist of seven or more irregularly defined mountain peaks erected upon the same base, of nearly uniform height, grouped within a radius of about 15 miles, frowning and rough beyond verbal description.

Going in by way of Indian creek these points cannot be seen until we have mounted the last ridge, which is itself 8000 feet high, and about four miles on an air line from the rocky sides of the Seven Devils proper. Here the queering beholder is confronted with grandeur, the occasion for which Dame Nature refuses as yet the slightest comment.

The beginning of the copper mining district is about five miles south from the Seven Devils. Here we have unfathomable deposits of copper ore, averaging over 75 per cent pure copper and carrying a small amount of gold. Passing up the wooded canyon from Indian creek we come to the Alaska, Copper Crescent, Blue Jacket and other mines located in the timber. These openings reveal undefined ledges which now belong to Brisson & Blake of Montana.

Mounting from this above timber line we pass several prospects, and after a journey of three miles north along the ridge parallel with Snake river, we come to the famous Peacock and South Peacock mines where shafts have been sunk 30 and 35 feet into the beds of ore. Just under the bill is a gold placer owned by Chas. Walker, which yields from \$5 to \$8 per day. Now turning to the east and going over the ridge a distance of two miles, we come to the Mountain Chief, where a ledge was opened in July last. From this point east across the gulch, a distance of one-half mile, is the Copper King, where another entirely different body of ore is found. Southeast one-half mile is the Humboldt, where a ledge was struck in August.

About four miles northeast is French Ledge, Placer Basin and the new discovery made by James Ruth in the early part of the summer. From the discoveries already made, their relative locations, and the fact that the country is not fully prospected we are impressed with the conviction that the Seven Devils mining district will ere long become one of the most extensive mining districts in the world.

AMERICAN NEWSPAPER ANNUAL.—The ninth annual edition of N. W. Ayer & Son's Newspaper Annual has just reached us from Philadelphia—a welcome arrival. Turning over its well-ordered and neatly printed pages, we can easily believe the publishers' avowal that, in its preparation, every endeavor has been made to render it more valuable than either of the preceding volumes, as a ready reference-book on all statistics pertaining to the newspaper press. An important change has been made in this edition, in the arrangement of the States. Hitherto the States have been grouped in geographical sections, and notwithstanding they still believe this to be the most convenient for advertisers, the publishers have been induced by the suggestion of many patrons, and particularly by the fact that the Annual is now largely used as a book of reference by those accustomed to an alphabetical arrangement, to adopt that plan. In its present form it furnishes not merely a comprehensive and accurately compiled newspaper directory, but also a gazetteer of condensed information relative to the topography of the country, and its agricultural, mining, manufacturing and commercial resources. It makes a fine royal octavo of 1072 pages, costing \$5. We have found the editions of former years very handy and helpful, and expect to enjoy a like experience with that of 1888.

STANFORD UNIVERSITY.—Eight of the buildings at the Stanford, Jr., University, are finished by the masons and are now being roofed with tile. The smokestack, 150 feet high, erected at the engine-house and machine-shop, is a landmark for miles around. The whole series of stone arches forming the south corridor and also three massive arches composing the chapel entrance are also completed. A portion of the ground is being cleared up and graded preparatory to being laid out by landscape gardeners this winter. Concrete foundations have been laid on the north line of the quadrangle for six more buildings, and two other buildings necessary to complete the ends of the quadrangle are well under course of construction. The Stanford mausoleum, now being erected on the Palo Alto estate, begins to assume shape. The exterior is of a rich-colored blue granite, while the interior will be lined with white marble. On a massive block of granite forming the archway to the entrance are inscribed the names of Leland Stanford, Jane L. Stanford, Leland Stanford, Jr.—*Redwood Times and Gazette*.

The mica mine at Tres Pintas, New Mexico, is said to contain the largest deposit of that mineral in the world. A factory is to be established in Denver, Col., for pulverizing mica. The substance is now used in the manufacture of wall-papers.

The Russell Process.

Its Practical Application and Economic Results.

(Concluded from our last.)

c. At the Marsaac Mill (Daly Ore), Park City, Utah.—Table XLII gives all the mill tests so far made in the series of experiments now being conducted by Mr. W. A. Wilson, superintendent of the Marsaac mill, to test the applicability of the Russell process to the ore treated in that mill. In all cases the ore was roasted for amalgamation—not for leaching. If the ore had been roasted with reference to the Russell process, the results by that process would probably have been 2 to 5

TABLE XLII.

COMPARISON OF THE RUSSELL PROCESS WITH AMALGAMATION AT THE MARSAAC MILL, PARK CITY, UTAH, IN 1887, ON "DALY" ORE ROASTED FOR AMALGAMATION.

No. of Mill-run.	Total Time Covered by Mill-Run.	Value of Ore, per Ton.	Size of Screen Used.	Per cent of Salt Used.	Per cent Extracted by Ordinary Process in Mill.	Per cent Extracted by Russell Process in Mill.	Per cent Extracted by Amalgamation in Mill.	Per cent Extracted by Extra Leaching.	Per cent Extracted by Extra Leaching in Assay Office.	Per cent Extracted by Extra Leaching in Assay Office.
1	33.22	20	10	93.4	94.4	90.0	88.9			
2	35.43	20	10	97.2	91.0	90.7	88.6			
3	43.03	20	10	80.9	91.2	89.9	87.5			
4	40.74	29	10	88.8	90.8	89.0	86.6			
5	38.87	20	10	89.4	91.6	90.7	89.1

Averages.				88.9	91.1	90.6	89.2			

per cent higher. The weight of ore used in the leaching charges was 2 tons; and in those for amalgamation 1.5 tons each. The amount of water used in amalgamation is 7 to 8 times the amount used in leaching. The comparison in expenses has not been made; but the Marsaac mill expenses are about \$11, and the difference will probably be \$4 to \$6 (see table) in favor of the Russell process, the ore being a simple alkaline ore and requiring only a small amount of chemicals. Experiments are now being made with less salt and coarser screens for the leaching tests, a 20-mesh screen and 10 per cent of salt being the least which can be used for ore to be treated by amalgamation.

d. At the Ontario in 1887-1888.—Table XLIII gives all the mill tests so far made in the series of experiments now being made similar to those in the Marsaac mill on Daly ore. These tests also are being conducted by Mr. Wilson to determine the applicability of the Russell process to the Ontario ore. In all tests, the crushing, the percentage of salt used,

TABLE XLIII.

COMPARISON OF THE RUSSELL PROCESS WITH AMALGAMATION AT THE ONTARIO MILL, PARK CITY, UTAH, IN 1887, ON ONTARIO ORE, ROASTED FOR AMALGAMATION.

and the roasting are fixed with reference to obtaining the best possible results by amalgamation, and not at all with reference to the leaching. Nevertheless, the mill extraction by the Russell process averages 9.4 per cent of the value of the ore above the results of amalgamation. The weight of each leaching charge was 2 tons, and that of each amalgamation charge about 1.5 tons. The Ontario ore has always required about three times as much water for leaching as any other roasted ore, but still the amount of water used in amalgamation for Ontario ore is 2.7 times that required for leaching the same ore. On all other roasted ores, the amount of water required for amalgamation averages 16 times that used in leaching. The Ontario mill expenses are about \$13 per ton. Those for leaching would be about \$5 to \$6 less, or a difference in favor of the Russell process of \$5 to \$6 in expenses, which, together with the additional extraction of 4.11 ounces, makes a total net difference of \$9 to \$10 per ton.

For January, as in December, the experimental plant at the Ontario mill was run by Mr. Wilson on Ontario ore alone, it not being considered advisable to run the plant on both Ontario and Daly ore at the same time. The following statement gives the average results for January, 1888, by the Russell process and by amalgamation:

Extracted by:	Per cent.
Ordinary in assay office.....	32.1
Extra solution in assay office.....	33.8
Russell process in mill.....	33.0
Amalgamation in mill.....	33.1

The following statement shows the compari-

son between the extraction by the ordinary solution in the assay office, and that by amalgamation in the mill, for the last ten days in January:

	Per cent.
Ordinary solution in assay office.....	32.0
Amalgamation in mill.....	33.1

The best results by the Russell process on Ontario ore were obtained while using a stock solution of about 1.5 per cent hyposulphite, at a temperature of 90° to 120° F., and with an extra solution of about the same temperature, and using about 6½ pounds of bluestone per ton. The weight of charge treated was 2 tons. The depth of the dry charge before leaching was 24 inches, and after leaching 18 inches. For 2 tons of Daly ore, the depth is 22 inches, and after leaching 16 inches. The temperatures of the solutions are the same as for Ontario ore; but the amount of bluestone used is only 4½ pounds per ton. Although both Ontario and Daly ore yield an alkaline first wash-water, the extra solution can be circulated (and usually is), as if they yielded an acid first wash-water. The amount of gold extracted by the Russell process from both Ontario and Daly ore is the same as by amalgamation. The amount of gold in the ore is, however, quite small, amounting to only about 0.1 ounce per ton for shipping ore and probably about one-half that amount for milling ore.

e. At Cusiuhiric, Chihuahua, Mexico.—Table XLIV gives the comparison in mill results, both in apparent and actual extraction,

Name of ore treated.		Mesh of screen used.		Per cent of salt.		Value of ore, Oz. silver per ton.		Per cent of salts soluble in water.		Per cent by ordinary in assay office.		Per cent by extra in assay office.		Number of tons treated.		Apparent extraction in mill. Per cent.		Actual extraction in mill. Per cent.		By which process.	
San Miguel.....	26	10	10	83.08	0.630	0.91.9	60.87	0.630	0.91.9	60.87	0.630	0.91.9	60.87	0.630	0.91.9	60.87	0.630	0.91.9	60.87	0.630	0.91.9
San Antonio and San Bartolo.....	50	10	10	46.30	10.635	0.80.2	60.86	3.79	6. Amalgamation.	60.86	3.79	6. Amalgamation.	60.86	3.79	6. Amalgamation.	60.86	3.79	6. Amalgamation.	60.86	3.79	6. Amalgamation.

between the Russell process and amalgamation. The ore for each test was weighed with the utmost care. In this case also, the crushing, use of salt, and the roasting were conducted solely with reference to obtaining the best results by amalgamation. The results showed, in the case of amalgamation, a discrepancy between the apparent and the actual extraction, the actual extractions being 6.7 per cent less than the apparent. The results of leaching, on the other hand, showed a plus discrepancy, the actual extraction averaging 2.2 per cent more than the apparent. The comparison in actual extraction in silver is in favor of the Russell process by 11.4 per cent of the value of the ore,

TABLE XLV.

COMPARISON OF THE RUSSELL PROCESS WITH AMALGAMATION AND WITH COMBINED AMALGAMATION AND CONCENTRATION AT THE BIG SANDY MILL, ARIZONA.

Description of run.		Number of run.		Value of silver per ton.		Per cent extraction by concentration.		Per cent extraction by amalgamation.		Total mill extraction, per cent.		Per cent extraction by ordinary in assay office.		Per cent extraction by extra in assay office.	
I.	4 days run without chemicals.	1	21.8	28.7	53.3	54.0	50.5	53.1	52.5	53.1	50.5	53.1	50.5	53.1	50.5
II.	3 days run with chemicals.	1	21.8	28.7	53.3	54.0	50.5	53.1	52.5	53.1	50.5	53.1	50.5	53.1	50.5
III.	6 days run with chemicals.	1	21.8	28.7	53.3	54.0	50.5	53.1	52.5	53.1	50.5	53.1	50.5	53.1	50.5
IV.	3 days run with chemicals.	1	21.8	28.7	53.3	54.0	50.5	53.1	52.5	53.1	50.5	53.1	50.5	53.1	50.5
V.	4 days run with chemicals.	1	21.8	28.7	53.3	54.0	50.5	53.1	52.5	53.1	50.5	53.1	50.5	53.1	50.5
No leaching tests made.															

or 5.7 ounces per ton. The difference in expenses between the Russell process and amalgamation is less for Cusi than for most other ores, being about \$2.50 per ton in favor of the leaching, making a total net difference of over \$8 per ton in favor of the Russell process.

C. Comparison Between the Russell Process and Combined Amalgamation and Concentration.

All the foregoing comparisons have been based on mill results. On the ore referred to

in Table XLV, the data for which were furnished by Mr. G. J. Rockwell, no tests have yet been made on the large scale by the extra solution, hence the comparison is between mill results by amalgamation and concentration, on the one hand, and assay-office results by the Russell process on the other. The previous comparisons have been on roasted ore, but this is on raw ore. As no difficulty has been experienced elsewhere in obtaining as good results (within 2 to 3 per cent) in the mill as in the assay office on raw ore by the extra solution, there is no reason to expect any in this case. Table XLV shows in Run I a difference in favor of the Russell process of 53.5 per cent of the value of the ore as compared with the Boss process, and of 34.8 per cent of the value of the ore as compared with the combined Boss process and concentration. In Run II no leaching tests by extra solution were made. In Run III, the difference is in favor of the leaching as compared with the Boss process by 39.6 per cent of the value of the ore, and 38.3 per cent as compared with the combined Boss process and concentration. Run IV shows in favor of the Russell process 43 per cent when compared with concentration, or 35.4 per cent compared with concentration and Boss process combined. The average difference in assay-office results by the ordinary and extra solutions is in favor of the extra solution by 38 per cent of the value of the ore. Here also, as has been noted in the case of roasted ore, the amalgamation results agree closely with the results by the ordinary solution.

D. Relation of the Mill Results Obtained by Amalgamation, and those by the Russell Process, to the Results Obtained in the Assay Office by the Ordinary and Extra Solutions.

In making the comparisons between the mill results by amalgamation and by the Russell process, the relations of the former to the ordinary and of the latter to the extra in the assay office, have been noted. Table XLVI gives the results of millruns on five different kinds of ore by amalgamation and by the Russell process, and the corresponding assay-office results by the ordinary and extra. The extractions from San Antonio and San Miguel are actual cleanups in the mill, the others being apparent extractions in the mill. The

TABLE XLVI.

RELATION OF MILL RESULTS BY AMALGAMATION AND RUSSELL PROCESS TO THE ASSAY OFFICE RESULTS BY THE ORDINARY AND EXTRA SOLUTIONS.

Name of ore.		Percent extracted by ordinary in assay office.		Percent extracted by extra in assay office.		Percent extracted by amalgamation in mill.		Percent extracted by Russell process in mill.	
Lake Valley.....	71.9	81.5	79.6	83.9					
San Antonio and San Bartolo.....	85.0	89.2	79.6	91.5					
San Miguel.....	89.0	91.9	80.8	91.8					
Daly.....	88.9	91.1	90.6	89.2					
Ontario.....	89.2	92.9	82.1	91.6					
Average.....	84.6	89.3	80.7	89.4					

mill results by amalgamation average 80.7 per cent, which is 3.9 per cent below the ordinary in the assay office. On the other hand, the mill results by the Russell process average 89.4 per cent, or 0.1 per cent above the extra solution in the assay office, and 8.7 per cent above amalgamation in the mill. These results indicate that amalgamation results on roasted ore are almost as dependent on a good chloridizing roast as is the ordinary leaching process. But the Russell process, on the contrary, may be entirely independent of it.

VIII. Summary, Being a General Comparison of the Russell Process with the Ordinary Leaching Process, and with Amalgamation.

A.—With the Ordinary Leaching Process.—1. The Russell process permits a coarser crushing of the ore.

2. It requires a less careful chloridizing roasting. Hence less salt, and sometimes no salt, need be used.

3. The roasting may be accomplished in a suitable furnace almost instantly; but the roasting for the ordinary process requires time.

4. The results obtainable by the ordinary process are dependent upon a good chloridizing roast, while the Russell process is sometimes entirely independent of the chloridization, and always exceeds in extraction the amount actually chloridized.

5. The extra solution allows a much more systematic leaching and gives more regular results.

6. The results by the extra solution are not affected by the presence of caustic alkali in the ore or solution, while even minute quantities affect very powerfully the results by the ordinary process.

7. The Russell process is much more applicable to ores containing lime or lead.

8. It produces sulphides free from lead, and the lead as a by-product.

9. From raw ores it extracts often two to ten times as much as can be extracted by the ordinary solution.

10. Hence, ores which would require chloridizing for treatment by the ordinary process

can often be treated raw by the Russell process, thus allowing the erection of a cheaper plant and saving the additional expense and losses incident to chloridizing.

B.—With Amalgamation.—1. The cost of plant for the Russell process is much less than that for amalgamation.

2. It permits a much coarser crushing of the ore, the size required for amalgamation being rarely less than a 26-mesh and usually a 30-mesh screen, while leaching, on the other hand, requires only an 8 to 16 mesh screen.

3. The results of amalgamation are closely dependent upon a good chloridizing roast, while the Russell process is often independent of it.

4. Hence a less careful roasting is required, and therefore less, and sometimes no, salt.

5. The roasting for amalgamation requires time, while that for the extra solution can be accomplished almost instantly.

6. The extraction in the mill by the Russell process is almost always higher, and the expenses are always less, than by amalgamation.

7. Raw ores that can be successfully treated by amalgamation yield a higher percentage by the extra solution (except Silver Reef) and always at less expense.

8. The Russell process permits the extraction, from roasted ore, of copper and lead as valuable by-products.

9. It is not injurious to the laborers' health, as is apt to be the case with amalgamation.

10. It extracts compounds of silver which are not attacked by amalgamation.

11. It requires no machinery in the leaching, and no moving parts, except a single pump.

12. The charges treated are from 10 to 30 times the size of those treated by amalgamation.

13. The amount of water required for roasted ore averages only one-sixth, and for raw ore only one-thirtieth, of that required for amalgamation.

14. In large mills, the quantity of quicksilver in circulation represents a capital of \$30,000 to \$40,000, which is more than 150 times the cost of the stock solution for the Russell process.

(Concluded.)

A Good Cement.

Very often a form of cement is required around shops and mills for filling cracks in stone and brick work. New factories, especially, often develop awkward cracks between the window frames and the brick walls, and during the cold months the air entering here will largely reduce the coal pile.

Pronoe a lot of paint, old paint if possible, from a dealer; the skins forming on top of the paints, settlings from the bottom of paint pots, and, in fact, any refuse which contains oil, zinc, or other mineral body, may be used for the purpose.

Reduce this mass, especially if hardened from continued standing exposed to air, to the consistency of cream by soaking in some cheap oil. Heating may be resorted to if the hard paints cannot otherwise be softened.

When the whole has become soft enough to be stirred into a homogeneous mass, more oil may be added, and the whole worked through a sieve, and then run through an ordinary paint-mill.

A quantity of common whitening is next to be worked into the oil and paint, much in the way as when ordinary putty is to be made. The thickness of this putty, as we may now call it, should not be as dense as when used for glazing.

When the whitening has been thoroughly mixed in and the mass well worked over, add a quantity of good Portland cement sufficient to bring the putty to a consistency which will enable it to be handled readily.

When in this state the putty may be worked into cracks in brick or stone work much as ordinary putty is used when allowed to set and harden, and it will become nearly as hard as iron, impervious to moisture and any reasonable degree of heat.—The Miller.

How to Keep Tools.—A machinist says: Keep your tools handy and in good condition. Every tool should have its exact place and should always be kept there when not in use. Having a chest or any receptacle, with a lot of tools thrown into it promiscuously, is just as bad as putting the notes into an organ without regard to their proper place. If a man wants a wrench, obisel or hammer, it's somewhere in the box or chest, or somewhere else, and the search begins. Sometimes it is found, perhaps sharp, perhaps dull, may be broken, and by the time it is found he has spent time enough to pay for several tools of the kind wanted. That habit of throwing every tool down, anyhow, in any way, or any place, is one of the most detestable habits a man can possibly get into. It is only a matter of habit to correct this. It may take a moment more to lay a tool up carefully after using, but the time is more than equalized when you want to use it again, and so it is time saved. Habits, either good or bad, go a long way in their influence on men's lives. Keeping tools in good order, and ready to use, is as necessary as keeping in the proper place. To take up a dull saw or dull chisel, and try to do any kind of work with it, is worse than pulling a boat with a broom, and it all comes from throwing down tools carelessly—habit. To say you have no time to sharpen is worse than outright lying, for if you have time to use a dull tool, you have time to put it in good order.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NEW LONDON.—*Dispatch*, Oct. 27: At this mine they are drifting north and south from the 1250-foot level. About 2000 tons of paying ore is on the dump pile. The mine is being worked in a thorough and systematic manner by Humphrey Reese.

CHICAGO.—This property is located about half a mile east of the New London. It is owned by Mr. John Cupps. Owing to a hitch in the management, it has been shut down for some time, but last week was started up with renewed vigor. The water is now being taken out.

CRAIN.—The rich deposit struck by A. J. Crain on his place four miles above Plymouth, holds out well.

DOYLE.—It is said the scheme to boom this property has fallen through.

REED & ASKEY.—The new mill being erected at this mine is nearly completed. It is expected to be in running trim by the 10th of next month. It will be a 10-stamper, with two concentrators. The mine is worked by two tunnels; the north tunnel is in 300 feet and the south tunnel 500 feet. A crushing will be had as soon as practicable.

Calaveras.

RUNNING.—*Calaveras Chronicle*, Oct. 27: Since resuming operations at the A & B mine, which was shut during a portion of the summer months, owing to a scarcity of water, the shaft has been pumped out and the mine is now running with a full force of workmen.

UTICA.—*Mountain Echo*, Oct. 27: Extensive work is being accomplished on the surface at the Utica mine in this town. The new mill is now under way, and other improvements are being made. The new works will be the largest and most expensive of any in southern mines.

NEVILLS.—An immense pile of lumber is lying in front of the Nevills Hoisting Works which is to be used for timbering from the 400-foot level down, as soon as they commence sinking, which will be in a short time. The Nevills mine is destined to be the leading gold-producer of Calaveras county.

El Dorado.

REOPENED.—*Placerville Observer*, Oct. 30: We were shown some ore taken from the Bobby Burns mine, situated eight miles east of this city, the other day, the sight of which was good for sore eyes. This mine, which has lain idle for 25 years, was opened up about four weeks ago, and the prospects referred to are most encouraging to the owners, the Blair brothers, Tom Alderson, Tom Stephens and Mr. Williamson. They are drifting at a depth of 50 feet, and have a five-foot ledge.

Los Angeles.

MINING AROUND ACTON.—*Newhall Times*, Oct. 27: The Red Rover mine is about three miles northwest of Acton, and is owned principally by E. B. Miller of Los Angeles, with W. A. Roberts as superintendent. The mine was worked a great many years ago by Mexicans, and some extensive tunneling was accomplished, but it was finally abandoned and laid inactive for a number of years. Finally the present owners got possession of it and have been working good paying rock for quite a time. The body of ore is quite wide, with free gold, and pans out from \$12 to \$75 per ton. A shaft 230 feet deep was sunk on the lead and about 2000 tons of good ore were put on the dump. Operations ceased on account of the water coming into the mine, and the work on this line was stopped for awhile. The ore has been worked, but the dump is now down to about half its former size and will be worked out before the winter is over. Another shaft, the same depth as the above, has been sunk on the vein about 150 feet from the first one, and it is the intention to run crosscuts and take out the ore above the waterline. It is expected that considerable new machinery will be purchased, and that a large force of men will be kept at work this winter. The mine is a good paying one, and when developed will be a dandy.

GOOD ASSAYS.—John Green's mine, the Old Padre, has shown assays of \$750 per ton, and this only on what might be called surface rock. He is sinking shafts and running tunnels, and has a good dump. A party of capitalists offered \$30,000 for it, but Green said it was worth more to him and kept it. John Reiley has a five-stamp mill at his New York mine, and is running on good rock.

Mariposa.

AROUND COULTERVILLE.—*Mariposa News*, Oct. 26: The prospectors south and east of here are striking pockets all the time varying from 20 to 100 ounces. W. B. Stolder & Co. have struck a good pocket on the old Dave Lewis on Scotts gulch and have taken out considerable money. The Red Cloud is doing well. The supply of water is only sufficient to run one mill in the daytime. The ore crushed is paying well, averaging \$60 a ton. This ore is coming from a drift that is being run for the purpose of getting under the pay chute, where they expect to do better. Our mining interests are on the improve, as recent facts show. The old Virginia mine has been bonded by Col. Crook of Big Oak Flat, who is reported as representing a New York syndicate. He is going to thoroughly develop the property. Material is now being ordered for substantial hoisting works. The Bonduant Hathaway mine still stands at the head. They are preparing to put on good substantial hoisting works which will enable them to go down to an indefinite depth. The ore is very good. This company is negotiating for the purchase of the Rud mine on the north fork of the Merced, which is supposed to be a continuation of the Bonduant vein.

Monterey.

LOS BURROS.—*Monterey Democrat*, Oct. 20: Mr. Hackworth of Jolon was in Salinas Thursday. From him we learn that Mr. Cruikshank has struck three ledges in the tunnel he has been putting in the side-hill since March last. The tunnel is now in about 300 feet and the work is being pushed for other ledges in sight above on the surface. One of the

ledges struck was about eight inches between walls, and the other two about a foot between walls, while the one in view is expected to measure five feet. All these ledges are extremely rich in gold. Appearances indicate a strike soon in the King mine. The road to the coast from the mines has been used, but it is not very good. What the camp wants is a good road from Jolon to the mines.

Nevada.

SHOWING UP WELL.—*Grass Valley Union*, Oct. 25: The new ledge in the Empire, recently struck by crosscutting into the footwall from the 17th level, is showing up finely. A drift has been run on it a distance of 50 feet, and the ledge is now 18 inches in size and prospects well in free gold. The depth at which this fine-appearing ledge has been found gives great encouragement as to future results, as there is no doubt felt that it extends up to the 11th level, and that it will hold in depth. The Empire has a long life before it.

NEW MILL FOR THE PITTSBURG MINE.—*Grass Valley Union*, Oct. 28: George G. Allan of Nevada City has obtained the contract for the building of the new ten-stamp mill of the Pittsburg Mining Co. This mill will have all the latest improvements, and when completed will not be surpassed by any mill of the same capacity in the State. Ground will be broken for the mill about the 10th of November, and the work will be completed inside of 90 days. In the meanwhile the underground work of the mine will be advanced by sinking the shaft for the tenth level, and extending the drifts and stopes. The Pittsburg is looking finely.

ROUGH AND READY.—*Cor. Nevada Herald*, Oct. 25: Work has been resumed on the Pinco ledge, which lies about three-fourths of a mile west of town. This ledge was prospected about a year ago by its owners, until their capital was exhausted, when they were obliged to suspend operations and go to work to earn the funds necessary to prosecute the work. They let a contract to two miners a few days ago to sink the shaft down to water level on the ledge, and work was begun this week. The ledge is about a foot thick and the rock looks well. The ledge about a mile west of town, near the old Colliis place, owned by T. J. Waggoner and others, is being reopened, after lying idle for nearly a quarter of a century, and it is thought, from two samples of rock taken out and pounded up in a band mortar, that the rock will yield from \$30 to \$40 a ton.

REDUCING THE FORCE.—*Herald*, Oct. 30: The Washington mine, located at Ormonde, discharged several of its employees last week and they have returned to this city. The crew of men will be smaller during the winter, but will probably be increased again in the spring.

Placer.

LAST CHANCE.—*Placer Herald*, Oct. 27: The quartz-mining industry is looking up in the Last Chance district. W. D. Perkins and W. D. Tuddsbury own the Star mine, which prospects very well. The ledge is six feet thick. A. H. Morrell is doing the prospect work. Loonis & Goolsby are sinking a shaft on the Leopold mine. Prospecting is being done on several other mines in the vicinity.

Plumas.

THE CRESCENT.—*Greenville Bulletin*, Oct. 24: The Crescent mine is now employing about 45 men in extracting ore and doing development work. Everything about the mine has a lively yet orderly appearance. Sixteen stamps are running constantly on ore from the Pet vein. During the last five months the mine has more than paid expenses, and the amount expended on the property up to that time, under Supt. Whitney's management, is being rapidly reduced.

San Diego.

GOLD AND THE REDUCTION WORKS.—*National City Record*, Oct. 25: The placing of machinery in the Reduction Works is going on as rapidly as can be expected, and the sampling works will soon be in running order. The working of the ground continues with good results, and the fact has been established that there is gold there. As soon as it is found in paying quantities, the fact will be announced. Mr. H. N. Bryant, who is making an excavation at his house, has encountered the same formation, and to satisfy his curiosity will make a test of the dirt, which is nearly as hard as rock.

Shasta.

SQUAW CREEK.—*Democrat*, Oct. 24: Our reporter visited the Squaw creek mines last Saturday and Sunday. He found the camp livelier than usual. Twelve men are employed on the Clipper and 20 on the Snyder. Both these mines were lately sold to companies who are now preparing to erect a mill on each property. Lee Fader has taken the contract to haul in the machinery, lumber, etc., for the Snyder, and is now at work on the job. Last Saturday Jack Conant brought out another \$5000 brick from the Uccle Sam. There is considerable new property on virgin ground and quite an amount of work is being done. Taking it altogether, Squaw creek is just now a very lively camp.

THE BUTTERS ORE MILLING WORKS.—These works at Kennett will be ready for business in about a month. The lixiviation and chlorination plant will be first started up, and early next spring a crushing plant will be added, then the works will be complete. The Calumet mill started up with its grand water-power on the 16th inst., and is running night and day. It was made known on the streets last Monday evening that Jack Conant had sold his mines on Squaw creek for \$150,000. The sale had been pending for some months.

Sierra.

FROM OVER NORTH.—*Cor. Sierra Tribune*, Oct. 26: Watin Prosser is expected back from San Francisco with Mr. Homsey and capitalists who intend to purchase the whole Port Wine ridge, having bonded already numerous claims at Scales and Fair Play, one being of a Chinese company for \$25,000. The Bella Union Co., near the Lucky Hill mine, is progressing finely with their bedrock tunnel. The Lucky Hill tunnel is already in 350 feet. They intend to put up a Burrell drill after the mine has been incorporated. The Union Consolidated Co. in Happy Hollow is now over 2200 feet in with their lower tunnel, which is several hundred feet below their old upper tunnel that was 600 feet long, at the back end of which the company prospected first by running an incline down over 1000 feet, and in which they found immensely rich dirt. Lately this incline was tapped by the lower tunnel five feet in

bedrock. They are driving the main tunnel ahead toward Grass Flat. At the same time they are making a double track for the cars to pass each other at the bottom of the incline. Mr. Trizel, who is the general manager and superintendent, has run said 2200 feet of a hard bedrock tunnel in less than 11 months. He is now baving his wash flumes made, and will soon be taking out as rich gravel as was ever taken out of any mine in Northern Sierra. The adjoining Pioocer has yielded prospects as much as \$200 to a pan of gravel from the richest part of the channel, and took out over \$400,000 from a small area of ground by hydraulic process. The Riffe Co. has finished all their new buildings, and are driving their upper tunnel toward the channel before them. At the Comet, owned by the Treasure brothers, and situated between the Excelsior and Riffe claims, they are running a bedrock tunnel, and expect soon to reach the same channel which yielded so rich in former years in Cedar Grove. At Cedar Grove is the Excelsior Drift G. M. Co. working quietly away in their bedrock tunnel, which we are informed is now 678 feet under ground. Their last 100 feet of tunnel was very hard rock. For awhile four men were only able to make three feet a day with No. 1 giant powder. The Caledonia boys are taking out good gravel near the Excelsior line, and are working under great disadvantages. Above the Caledonia are the Clipper-Ship, Home Star and Constitution claims, all running tunnels for the channel. Above these claims are the California and Table Rock claims, which have lately gotten into rich pay on the channel. At Pine Grove, Messrs. George Cox and T. Donahue are opening up the old French claim by a tunnel, having partly been worked through a deep shaft.

Siskiyou.

RIVER CLAIMS.—*Yreka Journal*, Oct. 30: Messrs. Rabbit and Doherty, the former an expert in the employ of Senator Jones of Nevada, have bonded the Swiss Bar mine at Klamath river, with the intention of working it in a different manner from the way river mines are worked here. They will sink a shaft to bedrock during this fall and winter to prospect for the pay channel, and next spring put in wing dams, with apparatus to be worked by steam engine in place of requiring so many current-wheels. All the river claims at the Klamath are still being worked with excellent success, and considerable gold will yet be taken out before the winter storms commence. A rich strike of quartz has been made by a man named Bulick; the ledge being about three feet wide, and located in the gulch west of the old trail leading from Yreka to Humbug creek. The quartz prospects from \$10 to \$16 a ton in the croppings, and may pay better when further developed. The miners in the dry diggings are making preparations for work as soon as winter storms commence, by getting out a great quantity of pay gravel to run through the sluices. The hydraulic miners are also fixing up ditches and pipes to commence operations as soon as the ditches can obtain sufficient water.

Tuolumne.

GEM.—*Union-Democrat*, Oct. 27: The little Gem, the extension of the Dunlap mine, is now looking well, there being several meo constantly at work developing it. Otto Kanig and Frank McKenna leased the McKenna mine on the Stanislaus river to a company of Austrians. The ore chute is five feet wide and looks well—prospects throughout the entire length of lead. A new ditch 1½ miles long is now being dug. Frank McKenna has been developing the Dunlap mine in the same vicinity; it is a promising property. The Jeffersonville Back Tunnel Mining Co. near Jeffersonville is doing well. Mr. A. M. Stetson, the superintendent, informs us that the work of sinking the shaft 115 feet was accomplished without machinery, but that last week a fine 15-horse power engine was placed on the property. He informs us that by about the middle of December the work will be down 450 feet, at which point the channel is expected to be reached. The present grade of the tunnel, or rather shaft, is about 34 to the 100 feet. The claim immediately adjoining the Jeffersonville claim on the south is the Humbug Tunnel. This mine in former times yielded as near as can be estimated about \$5,000,000, and the Jeffersonville Co. has good reasons for believing that its property is equally as valuable. The east or back channel which they seek is the old blue channel which has been fabulously rich all along the range of Table mountain, wherein it has been reached. The company is brim full of enterprise and means to work on a large scale.

NEVADA.

Washoe District.

SEG. BELCHER.—*Virginia Enterprise*, Oct. 26: The west drift from the top of the upraise is passing into vein porphyry showing feeders of quartz.

ANDES.—Are still doing some repair work.

OVERMAN.—Explorations below the tunnel level are continued.

BULLION.—The usual work is in progress on the 500 and 600 levels.

LADY WASHINGTON.—Work in the raise above the 725 level is being pushed ahead as usual.

SIERRA NEVADA.—The main south drift on the 520 level continues in low-grade vein material.

OPHIR.—The south drift on the 1465 level is still in vein porphyry. It is out a distance of 121 feet.

UNION CON. AND MEXICAN.—The joint Union drift on the 1465 level is in Mexican ground 102 feet.

YELLOW JACKET.—The mine will resume operations in excellent shape, both on the surface and under ground.

CONFIDENCE.—Repair work is still continued. Also some prospecting is in progress in very promising sections.

OCCIDENTAL.—Extracted 140 tons of ore; shipped to the Atlantic mill, 200 tons; average assay of wagon samples, \$29.

SCORPION.—During the past week the west crosscut on the 300 level has been advanced 21 feet, making its total length 132 feet.

CHOLLAR.—The north drift on the 450 level is out a distance of 679 feet. The face is in quartz assaying from \$5 to \$10 a ton.

UTAH.—On the 472 level east crosscut No. 2 has been extended 54 feet; total length, 186 feet. The formation is porphyry, clay and quartz.

POTOSI.—The south drift on the 650 level is out 521 feet. The face is in quartz and porphyry. East

crosscut No. 2, 250 feet south of the oorth line on the 650 level, is in 421 feet. The whole face is in quartz giving low assays.

CROWN POINT.—Connection was made with the Suto tunnel last Wednesday morning at two o'clock. The drift is up through the old Belcher air shaft.

BEST AND BELCHER.—In west crosscut No. 1, at a distance of 120 feet from the main northeast drift, the work of cutting out a winze station is still progressing.

KEYSTONE.—The shaft is down to the 300 level and a southwest drift is being run toward the vein. The ground that is being passed through presents a promising appearance.

BALTIMORE.—Prospecting operations are still vigorously prosecuted on the 338 level in ground of a very promising character. A considerable amount of ore is being accumulated.

BELCHER.—On the 200 level the north drift is out 84 feet. On the 160 level the drift from the Crown Point is out 173 feet. Work on the chutes and other repairs are about completed.

JUSTICE.—Good head way is being made with the new mill. It will start up with an accumulation of over 2000 tons of ore on the dump, and a vast deal opened up in the mine ready for extraction.

ALPHA AND EXCHEQUER.—The north lateral drift on the 500 level of Alpha is in from the shaft a distance of 114 feet. The face is wholly in quartz giving low assays. The south lateral drift on the same level is in a distance of 37 feet. The face is in quartz.

ALTA.—Are running the mill on ore that is being extracted from the stopes between the 725 and 825 levels. The concentrating apparatus connected with the mill is doing good work. The west drift on the 925 level will reach the vein in a few days. On the 725 level the work of reopening the oorth drift to the Benton line will be completed in four or five days.

HALE & NORCROSS.—From the 600 level the upraise 40 feet south of joint east crosscut of the 500 level development mentioned in the last weekly letter, have started a prospecting drift 30 feet below this level and have encountered the downward continuation of the same ore. On the 800 level the west drift was advanced 10 feet and the south drift the same distance.

SAVAGE.—On the 500 level, west crosscut No. 1 has been advanced 15 feet and temporarily discontinued. The joint east crosscut on the south boundary of the mine is out 62 feet. The last 17 feet of this drift is in good ore. The car samples average \$50 a ton. On the 950 level, No. 1 east crosscut has been extended 18 feet. From the several levels are extracting about 50 tons of ore a day, which is being shipped to the Rock Point mill.

CON. CAL. & VIRGINIA.—The 1400 level stopes are looking well and are yielding the usual quantity of good ore. The same may be said of the stopes on the 1435 level. On the 1500 level are stoping ore from the parallel north drift, 60 feet north from the upraise above that drift. Continue to stop on the southeast drift run from that upraise 58 feet above the track floor of this level. The stopes on the 1600 level continue to look well. On and above the 1650 level much good ore is in sight. The quantity of ore shipped to the mills will be about the same as usual, notwithstanding the accident to the hoisting engine at the C. and C. shaft. The average of the pulp assays will be about as high as last week.

Cottonwood District.

NICKEL AND COBALT.—*Silver State*, Oct. 26: G. F. Turrittin, who visited the Cottonwood mines in Churchill county last week, says the Bothwell Bros., who are working the nickel and cobalt mines at that place, are taking out fine ore. They have good hoisting works on the mine and several men at work. These are the only nickel and cobalt mines worked in the United States with the exception of one of limited production in Pennsylvania.

Hawthorne District.

SMELTER.—*Esmeralda News*, Oct. 20: The arrangements for the erection in this county of the much-talked-of smelter appear to be coming to a head. A. E. Dick, one of the principals of the enterprise, was in town this week, and from him it is learned that a meeting of the stockholders and others interested will be held at Carson City for the purpose of settling definitely the location of the works, and that it was probable that Hawthorne would be selected as the site. It is also understood that the machinery has already been ordered, and as soon as the location is decided upon, will be shipped. Ore carrying ten per cent or more copper will be purchased by the company, and for the ten per cent class, which is very low grade, 88 per ton will be paid. There are numerous base metal mines in Moss and Santa Fe districts which are now lying idle, some of which already have as much as 300 tons of copper and lead ore on the dump ready to be delivered to a reduction works of that kind. Should the furnace be erected, the owners of those mines would then be assured that their ore could be worked near home at small cost. This point is certainly the most desirable and best for its location, for the reason that wood, coal and coke can be laid down here at less cost than further south, while a better bullion rate for transportation can also be obtained.

Jackrabbit District.

ONONDAGA MINE.—The proprietors of the Onondaga mine have decided to place a steam hoisting plant on the property. Better hoisting facilities than those now used are needed, and the appearance of the property justifies the expense. A hoisting engine has been purchased from the P. C. Mfg. Co. here, and the work of removing and placing it will begin at once. This property has been one of the standbys of that district for some time and may yet develop into a bonanza.

Jefferson District.

RICH ORE.—*Belmont Courier*, Oct. 20: The Harrison brothers are taking out rich ore from their mine. Charles Kanroth will soon start up his mill at Jefferson; the ore extracted from his mine is of a good grade.

Mount Rose District.

LOTTIE AND LIBBIE MINES.—*Silver State*, Oct. 27: The Lottie and Libbie mines, eight or nine miles from Paradise, are being worked by W. T. O'Hara. At a depth of 30 feet the ledge is about 30 inches wide, and the ore averages \$40 per ton in sil-

ver. Mr. O'Hara is a practical assayer, and the average given is below the actual results of 300 assays. The mines adjoin and are owned by W. T. O'Hara and W. C. Green, who are pretty confident that they have a valuable property.

Morey District.

LOOKING WELL.—Belmont *Courier*, Oct. 20: John A. Moore, one of the lessees of the Morey mines, informs us that the mines in that district are looking first-class, and that the lessees are extracting rich ore.

Spanish Belt District.

GOON ORE.—Belmont *Courier*, Oct. 20: The Barcelona mine continues to look well and is producing good ore. Work on the new mill at Spanish belt is being pushed rapidly.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Oct. 26: The crosscut from the north drift, 250-foot level, extended 10 feet; total length, 204 feet.

GRAND PRIZE.—Water has been lowered to within 21 feet of the 400-foot level station during the past week.

DEL MONTE AND NORTH COMMONWEALTH.—The combination shaft has been sunk and timbered 8 feet. The rock continues hard, with a slight increase in the flow of water.

FOUND TREASURE.—Some ore has been taken out and shipped to reduction works. The North Commonwealth people are surveying workings, and but little work is being done on this account.

NAVAJO.—The stopes are looking well and have yielded their usual quantity of high-grade ore.

NORTH BELLE ISLE.—During the week 30 feet of the first stope on the 400-foot level, near the Queen line, have been stilled.

NEVADA QUEEN.—The stopes above the 250-foot level have yielded the usual amount of ore. Battery pulp assayed \$172.23 per ton. Average assay from 490 carloads concentrating ore \$22.65 per ton. Shipped 10 bars bullion, assay value \$20,883.19.

COMMONWEALTH.—150-foot level: No. 3 north drift from No. 1 east crosscut has been advanced 19 feet. No. 2 winze from east lateral drift has been sunk 7 feet with but little change. Joint crosscut has been advanced 12 feet; will reach the east lateral in about four days. 225-foot level: South drift has been advanced 22 feet through the same formation as found above on the 150-foot level.

Tybo District.

PAYING ROCK.—Belmont *Courier*, Oct. 20: W. D. Dimmick has discovered a good body of ore in his mine from which he will extract large quantities of paying rock.

ARIZONA.

RICH STRIKE.—Tombstone *Epitaph*, Oct. 25: Supt. Coffman of the Waterville Mining Co. reports the striking of a big body of ore in the new double-compartment shaft in the Bunker Hill mine. The body was encountered two days ago at a point 402 feet from the surface and 42 feet below the fourth level. Assays from the croppings showed 58 ounces in silver and 57 1/2 per cent lead. The whole shaft is now in ore which improves in richness as depth is attained. Four tons of ore have already been taken from the shaft.

VARIOUS CAMPS.—*Journal-Miner*, Oct. 24: The Wonder mill in Turkey creek district will be started up soon again if there is a sufficient water supply. Robert Cartmel was in town to-day trying to engage freighters to haul ore from his Big Bug mine. He has several tons out ready for shipment. Jules Baumann is in from his Lawrence mine, Agua Fria district. He has nearly a carload of high-grade ore out ready for shipment. Ore receipts at the sampling works of the Arizona Ore Co. yesterday were 32,812 pounds. During the week from Monday morning up until Friday evening, five days, the following lots of ore were received: From Kuehne & Co., Belle mine, 42,600 pounds; John S. Jones, Groom creek, 2000 pounds; Riggs & Lawler, Hillside mine, 9300 pounds; F. M. Murphy, superintendent of the Congress mine at Martinez, 35,900; Jules Baumann, Lawrence mine, Agua Fria district, 6,000 pounds. This makes a total for the five days of 96,200 pounds, or a little over 48 tons, the value of which was \$5100, an average of a little over \$106 per ton. Since the first day of May, 1888, the Ore Co. has paid out for ore to miners, \$115,000.

SILVER KING.—Mohave *Miner*, Oct. 27: N. C. Amer brought in this week from the Silver King mine at Stockton Hill, ten tons of silver ore which worked 274 ounces per ton. Mr. Amer has recently made a good strike and the vein is steadily improving as work advances. John Popham was in from Mineral Park this week with a shipment of ore from the Lone Star which worked upward of 350 ounces per ton. Messrs. Thomson, Davis & Popham are working the Lone Star on a lease, and while this shipment does not come up to their expectations, they are satisfied with the result.

NOTES.—Prescott *Courier*, Oct. 26: P. A. Craigue came in yesterday from his Dosoris mine and said that lessees of the mine are doing well. J. W. McGowan is pushing matters at the Senator. He has a large force of men employed. Expects to have his mill running in a short time. F. M. Murphy of the Congress keeps right along shipping rich sulphurets. John Lawler has just returned from the Hillside mine, which is getting bigger and bigger. Heavy roads retard the shipping of ore. Mr. Long, superintendent of the Oro Bella, and N. C. Sheekles, superintendent of the Crowned King and other mines in Bradshaw Basin, are going ahead with the work of mining and erecting mills. J. B. Kerr, in Weaver district, has his stamp-mill completed. Mr. Layton of Hassayampa district reports unusual activity in the mines of that district. Mr. Williams, superintendent, and Mr. Prout, foreman, of Copper Basin mines, act as if they would soon start the furnaces. Small lots of gold keep coming into the Bank of Arizona.

SILVER ORE.—*Silver Belt*, Oct. 27: Simon Billing has received returns from a shipment of 120 pounds of silver ore from the Woodville mine, which was sold to the Tucson sampling works. The ore assayed 6600 ounces to the ton, and the value of the shipment was \$331.45. The Woodville has produced considerable rich ore, and largely of ore going 40 to 50 ounces, which at present cannot be utilized, owing to the expensive methods of reduction

in vogue here. The Woodville is owned by James Pascoe, Simon Billing, Hyman Sullivan and Wm. Hender, and is situated 6 miles north of Globe and 1 1/2 miles from the old Emeline.

COLORADO.

PAYING MINES.—Idaho Springs *Gazette*, Oct. 24: The steady output from all of the large mines in our immediate neighborhood and the demand for their stock at advancing prices as an investment, speaks well for the mining district around Idaho Springs. The Silver Age Co.'s stock keeps advancing. The Plutus continues to produce largely. The Freeland is again coming to the front as the heaviest producer in the county. The Little Mattie is a steady shipper of very high-grade ore. The Kohinor & Donaldson Co., with their fine mill and good mines, having started up again under new management, must soon take a front rank with the other large producers. The Oneida is placing itself alongside of our best producers and bids fair to outstrip them unless the others increase their working force, which the Freeland, Plutus, Little Mattie, Champion-Donaldson and others can do, whenever they wish to enrich their stockholders with extra dividends. The Foxhall properties, at present worked by lessees, help to swell the monthly output, and a large number of smaller mines make up the large ore shipments from this comparatively new mining district.

DAKOTA.

GALENA SMELTER.—Deadwood *Pioneer*, Oct. 23: It appears probable that the Galena smelter will be blown in for its initial run, to-morrow or next day. Delay to date has been caused solely by non-arrival of coke, which left Chicago on the 11th and should have reached here long since. This not having been received, however, the management cast about them and finally succeeded in securing one carload of fuel from Rapid City. This was delivered at the plant yesterday, and before it is exhausted that due from Chicago will have been received. The bins are full of ore, and the Queen mine is daily outputting some six or seven tons. The mine can keep this up indefinitely. The Silver Bullion, Cora Bullion, Ontario and other mines in the district will contribute a measure, and the prospects are that when once started fires will not again be allowed to die out, and that the plant will be kept constantly running.

UNCLE SAM.—Deadwood *Pioneer*, Oct. 26: Two small pumps are now at work draining the Uncle Sam mine so that the Cornish pump lately received can be placed in position under the ground. Mining will begin as soon as the water is under control. The mill is in perfect repair, or will be before it is started up, and once in operation will be kept constantly pounding away. The Uncle Sam mine will be added to the list of bullion-producers before three months pass by.

MONARCH.—Developments are being vigorously prosecuted at the Monarch. Night and day shifts are employed and the pump and hoisting works kept in constant operation. The mine is looking favorable, a good quality of ore having but recently been encountered.

FLOAT.—The Galena smelter will probably be blown in to-day for a long continued run. Local engineers are more than usually busy at present making surveys of mining claims in Bald mountain, Ruby basin, Carbonate and Galena. A number of applications for patent will probably be filed next month.

IDAHO.

YREKA DISTRICT.—Wardner *News*, Oct. 27: Considering the amount of work done on the Elk creek gold mines and the recent date of their first development, the property of the Alma Con. G. M. & M. Co. may fairly claim the honor of beating the record in the list of gold-producers. The cleanup of last week astonished not only its owners but every mining man in the country. On leaving for Spokane on Monday, Mr. Wardner took with him five bars of gold weighing 966 ounces with a cash value of \$16,607. This was the result of a run of 11 days of a 20-stamp mill and is a grand showing indicating the future possibilities of the mines. Elk creek will soon be known throughout the world as one of the richest gold-mining districts yet discovered. There is now no doubt that the mines referred to will warrant the erection, at an early day, of a 100-stamp mill, and the owners of the property are the very men that will not be slow in its erection.

BEAVER DISTRICT.—Pony gulch is the scene of several busy operations; among the most prominent being the continued development of the Fay Templeton mine and the erection of the Huntington mill on that ground. The machinery of the new plant is all in place and will be running by the first day of November. The mine is opened by three tunnels, in all of which there is a splendid showing of good ore. No. 1 is in 160 feet with a crosscut of 40 feet, which will be driven to a distance of 200 feet to connect with the main tunnel which is known as No. 3. This last named working is in 200 feet, with a crosscut running toward tunnel No. 1. No. 2 has been driven 100 feet and work on its extension is rapidly progressing. Twenty-six men are at present on the pay-roll, and, under the foremanship of Jack Keeley, the work of development is most satisfactory. At least 2000 tons of ore are on the dump and the force of miners will be largely increased when the mill commences running. This being the first introduction of the Huntington mill in Cœur d'Alene, its operation is looked forward to with much interest. Its success in California is established, and those interested in its use here are confident of obtaining equally satisfactory results.

ORO FINO.—Owyhee *Avantache*, Oct. 23: About a month ago we stated that we might be premature in stating that a rich body of ore had been struck in the Oro Fino, but from appearances at that time we believed that such a body had been found. We are pleased to say that our predictions have been fully verified, and there is now in the face of the third level running south from the shaft and 600 feet therefrom, a lode fully four feet wide that will mill \$100 per ton. We are informed that for 300 feet above where this ore was found the lode has never been stoped, but is virgin ground.

ILLINOIS CENTRAL.—Rich ore is now being extracted from this lode, a large pile of which is on the

dump. We understand that the lode is of good size, the ore easily extracted and carries a large percentage of gold.

POORMAN.—The company owning this property is now cleaning out the old Belle Peck tunnel, with the view of extending it in a southerly direction to cut the Poorman lode at a depth of about 500 feet.

PHILLIPS & SULLIVAN.—This lode is showing very rich ore, but as drifts have not yet been run to any great distance on the lode, the full extent of the ore body is now unknown. The ore being extracted is rich.

SEVENTY-NINE.—This lode, owned by W. B. Knott, is showing a large ledge of good milling ore which is being bailed to the mill for reduction as it is extracted.

EMPIRE STATE.—This mine is being worked with a force of about 20 men and is looking well. The lode is large and the ore easily extracted.

OWYHEE.—This old mine is showing splendidly. The shaft and drifts are now in good ore. The mine will be developed as rapidly as possible and before a great while will be extracting large quantities for the mill.

MONTANA.

MINING NEAR BASIN.—*Inter-Mountain*, Oct. 20: It is well known that since the Anaconda Co. abandoned the Ruby they placed the same force of miners to work on some recently acquired properties near Basin. These are the Josephine, Kilrain, Last Chance and Carrie mines. The latter lodes are within half a mile of Basin, and a two-compartment shaft has been put down on the joining line of the two properties with the purpose of developing both of them from the same point. A double-compartment shaft is also being put down on a joining point of the Josephine and Kilrain lodes and has reached a depth of 70 feet, at which point crosscuts and drifts are being opened. A fine hoisting engine and boiler have been placed on these latter properties. There is considerable agitation in the district concerning a recent strike made in the Saturday Night claim, which was located this summer. The outcroppings at the surface, it is said, run from \$200 to \$300 per ton in gold and 50 per cent silver-lead. The property is owned and being operated by the three Wall brothers of Boulder and Messrs. Gibbons & Fisher. The place has been tramped over by prospectors for years, a trail being on it to the Mantle mine. The Mantle mine, a short distance from the Saturday Night, and which is said to be an extension of the rich discovery, is being actively developed and reported to be looking well. Mining in all parts of the Cataract district is said to be unusually active.

ELKHORN.—Boulder *Age*, Oct. 27: A bar of silver bullion, from the C. & D. mine, Elkhorn, was lost on the way down the other day, but was found by some honest person whose name was not ascertained, brought to Boulder and left with W. B. Gaffney, subject to the order of the owners. A stable, blacksmith shop and other structures have been erected or added to at the St. Paul mine, and the work of deepening the shaft is progressing satisfactorily. The formation in the shaft has changed, and would indicate the nearness of water. Should this come in in greater quantities than can be handled by the whim, the work of sinking will be suspended and crosscutting for the ledge begun.

GREAT FALLS SMELTER.—*Inter-Mountain*, Oct. 27: Messrs. Whitmore & Hathaway arrived in this city on Saturday with 14 tons of ore from the High Ridge mine, located about 8 miles from Twin Bridges, in the Tidal Wave mining district. They shipped their ore via the Montana Central to Great Falls. The inducements offered by the railroad and Falls smelter were greater than the sampling works here would give, and in consequence they shipped it. Ten dollars freight and treatment is pretty low, and if returns are perfectly satisfactory, more ore will be sent to the Falls smelter. Assays of their ore run from 1 to 1 1/2 ounces gold, 20 to 25 ounces silver, and from 50 to 60 per cent lead. This will run the aggregate from \$75 to \$90 per ton, and will net a handsome profit above expenses. They say they have a ledge 7 feet in width, with from 1 to 4 feet pay ore, and in places it comes in huge boulders and as much as 10 tons of ore has been taken out of one of these.

OREGON.

THE TOM PAYNE MINE.—Bedrock *Democrat*, Oct. 22: The Tom Payne mine is about nine miles northwest of Baker City and within one mile of the now famous Nelson mine. It lies in the same mineral belt and to the north of the Cracker creek mines. Mr. Geo. L. Hayes has for eight years been working this property in a primitive manner. A month ago Messrs. Young & Harris secured a contract on the property and since that time have had a set of men working under the supervision of Thomas Bentley. The developments have been of such a nature that the gentlemen have now decided to accept the property. A 10-stamp mill, to run by both steam and water power, has been secured by the present owners, and will be in running order on the mine within 20 days. A boarding-house is also in course of construction. There will be on the payroll of this company over 20 men next week.

THE SPARTA MINES.—Bedrock *Democrat*, Oct. 27: Almost within the confines of the town of Sparta is located the Oro Dell, a mine that gives great promise as a bullion-producer, as it is soon to pass into the hands of a wealthy Kansas syndicate, and before snow flies stamps will be dropping on Oro Dell ore. The mill will be ten stamps with sufficient power to double the capacity, run a saw and the necessary machinery for a first-class plant. One great advantage to the camp will be the custom department and sampling works, and all ore assaying over \$4 in free gold and \$6 in sulphurets will be bought by the Oro Dell company, as the company will put in four Free vanners for concentrating. We learn that the company negotiating for the Mary Ainsworth group of mines, 2 1/2 miles north of Sparta, will arrive from the East in a few days and work of a substantial character will commence at once.

WHITNEY.—Capt. Tom O. Whitney of Marietta, Ohio, owner of the celebrated Whitney group of mines, south of Sparta, leaves for the East to-day to complete arrangements for the permanent development of his property and the construction of the

necessary machinery to successfully treat the ore. Capt. Whitney has spent four months in examining the mines of Baker and Union counties, and is so well pleased with the general outlook that he has made several purchases.

THE NEHALEM COAL DISTRICT.—*Oregonian*, Oct. 26: It is hardly a year since the first entry of land was made in the Nehalem coal district and during that time samples have been brought here and tested with satisfactory results. Extensive developments have lately been made, and from specimens placed on exhibition at the fair it would seem as if the coal was of a higher grade than former samples would lead one to expect. Mr. S. J. Rafferty of Hillsboro, in the past two weeks has drilled into his claim about 20 feet, and he states that at the opening the coal vein showed a thickness of but two feet and that the vein pitched downward and inward at an angle of 35 degrees, and at a depth of 20 feet the vein had developed to a thickness of 5 feet. There is hardly any doubt but what there are thousands upon thousands of tons of coal in that region. Mr. Walker has also drilled into a surface vein 10 feet in thickness. There are other surface veins of from 4 to 12 feet in thickness. The following analysis of this coal was made some time since: Fixed carbon, 44.49 per cent; volatile combustible gases, 43.34; water, 7.81; ash, 4.36; total, 100. Total amount of combustible matter, 87.83 per cent. There is no doubt whatever as to the quantity, as there are from 40 to 50 claims aggregating between 6000 and 7000 acres of coal lands, which will readily give one an idea of the immense quantities of coal that can be mined and placed on the market when a four-foot vein is worked at a good profit. The mountains in which this coal is found have an immense growth of fine timber on them, which can also be placed on the market at a small cost when once means of transportation or outlet is made. A great many labor under the impression that these coal lands are located in Washington county, while with but one or two exceptions, the whole tract lies in township 4 north, range 4 west, in Columbia county, Oregon, about 25 miles from this city. There is no reason why Portland should not derive a great benefit from these mines when opened up, and be able to export coal as well as Tacoma and Seattle.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City *Enterprise*, Oct. 27: The Deep Down mill last week crushed eight tons of ore for the Mountain King. The returns were entirely satisfactory. Geo. H. Uter has purchased one-half interest in the Grand Tower group of mines at Gold Hill, from J. P. Cottrell. The Grand Tower is considered one of the best prospects in the camp. The heavy rain of last and the present week has materially livened up mining affairs at Pinos Altos. The Key, the Bell & Stephens and the Smith mills are running on full time. The Wagner mill is also running. Dr. H. H. Baker and Mr. McCreary of Kansas City have bought the Casson and Fraction mines of W. R. Corbett, who had them under bond. The mines are located at Pinos Altos. Captain Webb is now in charge of the work on the Thunderbolt at Pinos Altos, and is running two shifts of miners. Average assays taken from the vein recently show that the ore is above the average in value for the camp. The shaft will be sunk to a depth of 100 feet, after which drifting will be commenced. The *Enterprise* is under obligations to Julius Wagner, Wells, Fargo & Co.'s agent, for the amount of bullion shipped from Silver City since January 1st, to the first of the present week, which is as follows: Silver bullion from Silver City, \$71,876.57; silver bullion from Georgetown, \$104,837.39; gold bullion from Pinos Altos, \$146,243.17; a total of \$322,957.14. This bullion is generally billed at from three-quarters to one-half its real value, consequently the real value of the bullion shipped is in the neighborhood of \$500,000. The shipment of ore and concentrates has been much larger this year than ever before. The output of Grant county this year will equal that of last year.

UTAH.

BEAVER COUNTY.—Cor. Salt Lake *Tribune*, Oct. 28: The drop in lead has caused a depression here. The French Copper Co. means business, but no boom; they will try and see if low-grade copper ores can be worked at a profit in this part of Utah. No change in the Horn Silver yet. The Roe Bros. of Bristol have just made a heavy shipment of copper bullion, 95 fine, to T. R. Jones & Co. of Salt Lake.

LEAD.—Salt Lake *Tribune*, Oct. 28: Local mining interests are learning with dismay of the threatened free importation of ores from newly-developed properties in British Columbia. The Bingham miners are in low spirits over the drop in lead, due largely, if not entirely, to the free importation of Mexican lead ores. Col. Kaighn has learned that the monthly importations free of duty, via Laredo, amount to 8000 tons; and via El Paso, 7000 tons; there being no duty levied where the silver in the ore is worth more than the lead. And the outlook is more gloomy because of the Treasury ruling, that even if this be wrong, yet, as certain business interests have been built up on such a construction of the law, the ruling cannot be changed.

RUSSELL PROCESS.—Park *Record*, Oct. 27: Owing to the non-arrival of seasoned Oregon lumber and iron-piping, the Russell process at the Marsac mill will be delayed in starting up for several weeks yet. The Ontario 3-mile drain tunnel is in about 150 feet. The boilers and compressor are in place, but there is a delay in starting up the machinery on account of the failure of the necessary iron pipes to arrive. Dividend No. 149 on Ontario stock, aggregating \$75,000, or 50 cents a share, will be payable on the 31st inst. This makes the total of Ontario dividends to date, \$9,575,000.

ORE AND BULLION SHIPMENTS.—During the week the Crescent shipped 137,975 pounds of first-class ore and 193,000 pounds of concentrates. For the week just ended the Mackintosh sampler received 113,410 pounds of Ontario ore, 190,570 of Daly, and the Woodside leasers are completing a shipment of 212,000 pounds. The Ontario shipped during the week 41 bars of bullion, containing 21,609.95 fine ounces of silver. This morning 10 bars of Daly bullion, 10,124 fine ounces of silver, were shipped from the Marsac mill.

SCIENTIFIC PROGRESS.

Some Things That Science is Sure Of

The basis of modern science is observation and experiment, supplemented by verification as often as needed. In regard to the germ theory of certain diseases, among which typhoid fever stands prominent, there are no longer two opinions among scientific men. The exhaustive experiments of Tyndall, Pasteur, and others, have placed the truth beyond the possibility of doubt. They have sown the germs, fed, nourished, propagated, and transplanted them, and then starved, killed and extirpated them in so many different ways and under such varied conditions that they now know as much about them as the ordinary man knows about his barnyard fowls or his dogs and cats.

When Dr. Draper made the statement a while ago in the investigation of the steamer Prussian's fever cases, that there could be no case of typhoid fever without a previous case to supply the germs, he uttered no more than the legitimate dictum of science would warrant. In regard to Judge Pitman's sarcastic inquiry as to where the first germs came from, though the question is a natural and an interesting one, yet it is entirely outside the realms of legitimate scientific investigation, inasmuch as we can neither observe nor experiment upon the first germ.

Dr. Draper simply asserted the fact, which is indisputable, that in all human experience, so far as we know, the germ, or something corresponding to it, precedes all organic life. There is no well-founded evidence to the contrary. When the biologist and the physiologist talk about the germs of smallpox, and typhoid, and cholera, and the conditions under which they will live and flourish or decay and die, they claim no more than the farmer claims for having a knowledge of the conditions under which his corn or wheat or potatoes will grow or die. And if the doctors tell you that a typhoid germ will never produce smallpox, or a cholera germ diphtheria, they assert no more than the farmer when he says that a grain of wheat never results in producing a potato or a cabbage.

If the foregoing statements be true, it will appear that none of these germ diseases arise in consequence of an accumulation of filth and dirt, nor can we escape them solely by cleanliness and hygienic conditions. The mosquito, the leech, and the swamp fever prefer, if anything, the healthy to the unhealthy, and typhoid, and cholera, and smallpox have shown no dread of cleanliness and no special preference for filth and dirt. The precautions in regard to emigration suggested by our present scientific knowledge are to prevent any one who has recently suffered or been in contact with these diseases from being allowed a passage, and if any outbreak should take place on board, to have a hospital-room where the patients can be secluded and kept from contact with others.—*Ex.*

Heat Generation by Mechanical Means.

We have been asked by a correspondent to state if the heat generated by mechanical methods cannot be usefully applied and with economy. We answer—No. The reason for this reply we will endeavor to set forth in what follows: Whenever motion is arrested, whether by friction, compression, or percussion, or other mechanical means, heat is generated, the quantity of heat produced being exactly the equivalent of the mechanical energy that has been consumed—or more plainly, of the motion that has disappeared. This phenomenon is one of the most obvious and convincing illustrations of that great discovery of the present century—the correlation and conservation of the physical forces. It is simply the conversion of one form of motion—mass motion—into another form—molecular motion.

The notion, however, of employing mechanical means for the generation of heat for useful application, is handicapped at the outset by considerations of economy, which are all-important in looking at the subject from the practical side. With this element in the problem, the notion must be set down as impracticable (save in some exceptional cases), by reason, partly, of the difficulty that will be encountered in gathering up the heat and applying it without loss; but chiefly, because the generation of heat by chemical action (combustion) offers in almost every case a vastly more serviceable method of obtaining heat for domestic and industrial uses.

There are many curious and unexpected ways in which the generation of heat by mechanical means may be illustrated. We may recall the famous experiment of Count Rumford, of causing water to boil by the friction of a solid plunger fitting closely into an iron cylinder surrounded with water. The power of a windmill or water-fall can readily be made to generate heat enough to cause water to be turned into steam, by the interposition of suitable frictional surfaces exposed as to convey the heat as fast as it is generated, by the arrest of motion, into a body of water, etc. But, save in rare instances, and these to only a very limited degree and indirectly (as when the heat generated by the sudden compression of air is utilized to cause the ignition of explosive compounds), the idea of utilizing these methods is scarcely worthy of serious consideration in view of the measureless floods of heat that we are able to summon to do our bidding by using the simple act of combustion.—*Iron.*

ANCIENT MICROSCOPES.—In a recent lecture on "Ancient Microscopes" before the British Royal Microscopical Society, Mr. Frank Criepp exhibited a hundred or two collected from all parts of the world. He said that they served to illustrate the ignorance and incompetence of the ancients, which was no more than might have been expected, considering the dark ages in which our forefathers lived. They made their microscopes of paper, parchment, ivory, tortoise-shell and other such materials. One of the microscopes before them once belonged to Cardinal Lambertini, afterward Pope, who lived in the fourteenth century; he also exhibited another microscope made for one of the Popes by an Englishman; it was decorated, he remarked, with barbaric splendor. He likewise exhibited two which had been the property of George III. He exhibited ancient European microscopes, also some of Chinese and Japanese make; one of the latter had no lenses nor any place left for lenses. With most of the ancient instruments, he said, no work had been done of sufficient value to come down to the present time; indeed, with some of them no work could be done. One more recent microscope exhibited by him resembled a bent poker in shape. It was constructed to go down a patient's throat, and then, by means of a little glow lamp at the end, to light up portions of the interior of the human body, so that they could be seen by the aid of the system of lenses in the instrument.

ICE ON MARS.—At a recent meeting of the Academy of Sciences, Paris, M. Janssen, president, in the chair, observations were made on the canals of the planet Mars by M. Fizeau. The various circumstances connected with these appearances, as lately described by M. Perrotin and Schiaparelli, suggest a strong analogy with certain phenomena of glaciation—parallel ridges, crevasses, rectilinear fissures, often of great length and at various angles—observed in the regions of large glaciers in Switzerland, and especially in Greenland. This leads to the hypothesis of a vast development of glaciation on the surface of Mars, where, the seasons being relatively longer and the temperature much lower, the conditions must also be more favorable than on the earth for these manifestations. The reading of the paper was followed by some remarks by M. J. Janssen, who gave a guarded assent to M. Fizeau's "very ingenious and very beautiful" theory.

FORCE OF SEA WAVES.—Some idea of the tremendous force possessed or exerted by sea-waves may be formed by the fact that an iron column, 23 feet long and weighing some 6000 pounds—part of a new lighthouse being built—was, in the course of operations, landed at Bishop Rock, England, and, a storm coming up, was left lashed by a half-inch chain at each end to strong eyebolts. Three days afterward it was found, on examination, that the great column had been tossed up by the waves a distance of some 20 feet to the top of the rock, where it was yawing about like a piece of timber. Two days afterward, when the workmen were able to land, it was found that a blacksmith's anvil weighing 150 pounds, which had been left in a hole 3½ feet deep and 2½ feet in diameter, had also been washed by the waves completely out of the hole.

AN ALLOY FOR COLD SOLDERING.—*La Metallurgie* describes a new alloy which is useful when metals are required to be soldered together at a low temperature. Finely divided copper is obtained by adding zinc to a solution of sulphate of copper. From 20 to 30 parts of this copper, according to the hardness required, are mixed in a cast iron or porcelain mortar with concentrated sulphuric acid, to which is added 70 parts of mercury. The amalgam thus formed is thoroughly washed with water, in order to remove the sulphuric acid, and after being left untouched for some time it becomes sufficiently hard to scratch lead. In using the alloy for soldering, it is warmed until it assumes the consistency of wax, in which state it can be applied to the joint.

CARBON DYNAMITE.—One of the latest additions to the list of high explosives is called carbon-dynamite. It is composed of 90 parts of nitro-glycerine absorbed by ten parts of a variety of carbon. London *Iron* gives an account of some experiments with it, which seem to show that it possesses several important advantages over ordinary dynamite, among others considerably greater power, and the generation of much less noxious vapor when exploded in confined places. It is claimed also to be entirely unaffected by water.

LUMINOUS BACTERIA.—Prof. Pfleger and Dr. Tilanue have succeeded in cultivating, by Dr. Koch's method, the bacteria which produce the luminosity of sea fish. They have also been able to place them on a glass slide, which, in the dark, appeared thickly strewn with luminous points. Prof. Van Haren Noman has succeeded in photographing them.

MANGANESE STEEL, notwithstanding its high proportion of metallic iron—the most magnetic metal known—possesses the peculiar property of being almost entirely non-magnetic.

ELECTRICAL WONDERS are always on the increase, and every wide-awake man wants to keep pace with the progress of their development.

MECHANICAL PROGRESS.

A NEW BELTING LEATHER.—The Helvetia Leather Company, an incorporation recently organized by several prominent business men at Lancaster, Pa., manufacture from animal skins a sort of leather, exclusively for machinery purposes, by a special process. As is well known, in the ordinary process of tanning with bark, the tannin of the bark combines with the fiber of the skin, the result being a hardening or stiffening of the latter, which makes it especially adapted to resist abrasion or wear, as, for example, the leather used for shoe soles, or the same leather softened by oils used for the uppers of shoes. The Helvetia process is more a curing than a tanning operation. In it but 60 to 72 hours are required for the heaviest hides, instead of the six months of the bark process; and a cured hide of about one-third its original weight and four-fifths its original size, but in which every fiber of the hide has been perfectly cured and softened, is produced. Its tensile strength is claimed to be about four times that of the best oak-tanned leather, and when torn it shows a fiber very similar to that of a hemp or flax string. It is not adapted for belts when they are run under water, or are splashed with water, as with constant wetting the leather stretches rapidly, but always remaining soft, and being light and strong, pliable and firm, this leather is perhaps unequalled for belting, lacing combining apron straps, and the like.

PRESERVATION OF RAILWAY IRON FROM RUST. M. W. Spring of the Belgian Academy of Science and of the Paris Chemical Society, is of opinion that this phenomenon is solely due to a chemical cause, namely, the formation of a black oxide resulting from the combination of the yellow oxide with the metallic iron under the pressure of passing trains. He has demonstrated in his laboratory that on pressing into metallic iron slightly moistened ferric oxide an adhering coating of a black magnetic oxide is obtained. The pressure applied, 1000 to 1200 atmospheres, scarcely exceeds that brought to bear by each 50-ton locomotive wheel. And finally, on scraping off with a brass wire brush the black scales formed on the rails where the wheels bear, they proved to consist of magnetic oxide, with a very small proportion of metallic iron. Hence it will be understood why unused rails are covered with rust while an occasional train is sufficient to keep them clean and bright, magnetic oxide being one of the best protecting agents for iron surfaces. Mr. Spring's explanation appears very reasonable, so far as it goes, but it does not exclude the other causes mentioned, especially the influence of oil and grease permeating all railway machinery.—*Chicago Jour. of Com.*

ONE OF THE ORIGINAL LOCOMOTIVES.—The late A. L. Holley once made an after-dinner speech in relation to his early experience with Corliss' original locomotive. He reviewed his experience substantially as follows: The idea began to obtain hold that science should be pursued not in books, but in things; and I commenced the pursuit of science in and on and under one of the awfullest things this world ever saw. It was Corliss' original locomotive, euphemistically called "the Old Jigger." This locomotive was possessed of a certain inborn coarseness, which could hardly be the attribute of a mere machine—her spiritual nature was a sort of Mephistophelian ooze with a Colorado mule, and as to her physical constitution and membership, a cotton-factory "mule" was simple in comparison. The Old Jigger had an innumerable number of valves; and as a valve motion, well, nobody ever counted the number of pieces. They were as the sands of the seashore. Most of them used to jir off the first few trips of the week, after which all the men in the shop could comparatively keep track of the rest of them.

ECONOMY OF THE IMPROVED SIEMENS FURNACES.—Mr. Frederick Siemens, writing to the editor of London *Iron*, states that in the new Siemens furnaces, introduced since 1853, which are heated by radiation, the consumption of fuel is found to be reduced to less than eight cwt. of small coal to the ton of steel ingots produced. This saving in fuel is combined with the further advantage that the steel made is much more free from blow-holes than that made in furnaces heated by contact of flame, the finished metal being therefore stronger. In the older form of open-hearth furnaces, 150 charges were regularly made without a stoppage, and in the furnaces heated by radiation a much greater number of charges are made. At several works over 300 charges have been made without repairs; at one works 440 charges were made, and at another works a furnace had worked for 12 months, making two charges per 24 hours, without stoppage for repairs.

ECONOMY OF DEEP VS SHALLOW FURNACES.—A contemporary in a recent issue discusses the question of whether a deep or shallow furnace gives the better result economically. This is an important question, says the *Locomotive*, and one which has given rise to much discussion, and the distances fixed upon by different engineers show a great discrepancy, varying all the way from 15 to 36 inches for the height between grate and crown sheet. A difference of height with different kinds of fuel is undoubtedly necessary to obtain the best results, but the

best height will be found between the above extremes. An eminently safe rule to follow in all cases is: *Burn your fuel as close to the heating surface as you conveniently can.*

RIVETING STOVEPIPE.—A recent invention is a machine for riveting stovepipe. In this old way each of the six or nine rivets in a piece of pipe was drawn and driven separately. By the use of this riveting machine all the rivets are drawn by one drop of the hammer, and all of them are set by one drop of the hammer. One man with this machine can turn out from 600 to 1000 joints of pipe per day. The pipe is formed on a cylinder connected with the riveting machine, and this makes it uniform in size and leaves the lap smooth and free from buckles. There is, we believe, no machine of this description in the market, and it is said the invention will mark a new era in the manufacture of stovepipe. It is easily operated, there is no complicated machinery about it, and it does the work perfectly.—*Chicago Jour. of Com.*

IRON PLATES VS STEEL PLATES.—"During the last few weeks," says an English exchange, "a strong feeling has set in among shipbuilders in favor of iron plates in preference to steel for shipbuilding purposes, and makers of iron plates—particularly in the North—are reported to be very busy. Indeed, we heard of a firm having a very large order to place this week, who had to apply to most of the makers in the North before they could place the order, and then only for very long delivery. In fact, the makers are so busy that it is difficult to arrange for earlier delivery than from four to six months. We understand that the tendency in favor of iron plates is owing to the excessive rust now said to accumulate on both sides of the steel plates. We have no doubt that steel-plate makers will speedily devise means to obviate the defect."

LOCOMOTIVE BUILDING IN THE SOUTH.—The *Manufacturers' Record* calls attention to the fact that although there are upward of 38,000 miles of railway in the South, or nearly one-fourth of the entire mileage of the country, there is not as yet a single plant in the whole section from Maryland to Texas devoted exclusively to locomotive building, with the single exception of a small establishment in Maryland, where narrow-gauge locomotives are built. Our neighbor calls attention to this fact as affording a splendid field for enterprise. At the rate at which the industries in the South are being developed, it will not be long before this want is met. The South during the past few years has set the rest of the country an example of enterprise and push that has deserved, and has evoked, unstinted admiration.

STEEL PLATES AS CHEAP AS IRON ONES.—The firm of Carnegie, Phillips & Co. has sent out a circular to the trade stating that the firm will make the same prices for soft steel plates as are now quoted for iron plates for bridges, ship, tank and structural work generally. The fact that steel can be sold as cheaply as iron is occasioning surprise. A member of the firm said recently: "The steel is 15 to 30 per cent stronger than iron, and the result is that it has superseded iron; until now all important structures are built of steel. While steel for such purposes is being sold about as low as iron, prices have stiffened a little recently. It can scarcely be called an advance, but a hardening up of the market, as the demand is now good."

AGE OF LOCOMOTIVES IN GERMANY.—Herr Leonhardt, a German engineer who has been investigating the subject, says that the number of locomotives in use on German railroads at the end of the railroad year 1885-6 was 12,450. The average age of the locomotives in use during the year of service 1884-5, was 12.60 years; and in 1885-6, 12.49 years. This is deduced from a table of the number of engines added and in active use for each year, from 1845 to 1885. From this table it appears that 59 engines built prior to the year 1850 were running during the year 1885-6, and that the distinction of being the oldest running engine in Germany falls to one on the Holsleinische Marschbahn, which dates back to 1845.

OLD RAILS AND NEW.—A ton of old iron rails and \$4 will buy a ton of new steel rails. This is inducing the railroad companies to take up their old iron tracks and replace them with steel. For this reason old iron rails are becoming more plentiful in the market than they were a few weeks ago, when they were scarce. The new iron rail does not cut much of a figure any more, but the old iron rail is a very important factor in iron-making, and after it has become extinct, as in the course of a comparatively brief period it will, it will be easily missed, unless something as good or better should in the meantime take its place.

AN ELECTRIC DRILL weighing 100 pounds, and that makes a hole three feet deep in hard anthracite in 30 seconds, and one 6 feet deep in 1½ minutes, is the latest thing in electric drilling machines. It is designed by W. M. Schaeffer of Philadelphia.

A CENTER CYCLE.—An English invention is the "center cycle," having four wheels a foot in diameter, and a large wheel in the center. With it the rider is enabled to go up-hill as easily as to go forward on level ground.

GOOD HEALTH.

Is Malaria a Delusion?

Edwin Walters writes to the *St. Louis Republic* as follows: Malaria, so called, is a delusion. The word malaria means bad air. The disease that are attributed to this cause are frequently common in districts where there is no stagnant water or anything else to taint the atmosphere. It will be remembered that during the autumn of 1881 there was an unusual number of people who were attacked by these diseases in Southwestern and West-central Missouri and also Eastern Kansas, when there had been no rains of any consequence for months, and that, too, in districts far removed from decomposing water or any other substance. The cause or causes of these diseases were surely not in the air, consequently should not be attributed to malaria. It is more probable that during the dry, hot weather of summer the heat that is radiated and the electricity that is generated by the sun have an enervating influence on the system—that from the nerve centers this influence reaches the muscular system, principally through the pneumogastric nerve, and the stomach being the most delicate and intricate of almost any of the involuntary muscles, is the principal sufferer from such enervating influence. Indigestion follows as a symptom, and an increase of bile brings what is called biliousness and malaria.

I hope my medical friends, and I claim many as such, will pardon the presumption on my part of the discussion of a subject that comes more within their province than that of mine. But this conclusion has been forced from observations that reach over a period of many years as a surveyor in the West. I have observed that there were more cases of sickness of this kind during, or immediately after, the season in which there were the greatest number of electric showers or electric disturbances as shown by the surveyor's instruments. I conclude, then, that heat and electricity are the prime causes of "malaria," and that they weaken the stomach, and, in a large majority of cases, produce the disease usually attributed to this cause.

I give the thought to the profession with the hope that it will offend none.

Brief Chapter on Relishes.

The relishes are of two classes. First, those which depend mainly on one or more piquant substances, such as pepper, mustard, ginger, horseradish, vinegar, cinnamon and the various spices. These are combined with some one or more—generally with several—of the following vegetables as a base: tomatoes, usually green; onions, cabbage, cucumbers, pears, peaches, currants, berries, grapes.

Secondly, those which depend mainly on sugar, combined with the juices of various fruits, or with the pulp, as in the case of marmalade.

Now the question arises, are these and similar relishes conducive to health?

A normal, vigorous appetite needs no such aid. It is sufficient of itself. The lower animals need nothing of the kind. The cow's green grass, the horse's dry hay, and the dog's bone with a little meat on it, are doubtless eaten with a relish that our pampered stomachs know little of.

Unfortunately, all people have not high health. Some are in a feeble condition, with little or no appetite, and yet their recovery depends mainly on the food they take. In such cases some simple relish is not merely greatly desirable, it is necessary.

Many persons, in this driving age, come to their meals with little appetite. A sensible appetite quickens and increases the gastric secretions. In such cases, therefore, some piquant relish is really helpful. Probably even the strongest is not injurious, if need with moderation; but relishes are greatly pernicious if used to encourage overeating or to cause one to eat when the stomach is already exhausted from previous repletion.—*Youth's Companion*.

A BOY WITH TWO HEARTS.—The patient was again anesthetized. An incision was made in the neck over the tumor. The cartilaginous cyst was corrugated slightly and resisted the knife strongly. The surgeon had to proceed with the greatest caution and he on the lookout for the slightest puncture of the artery. An opening was finally made through the cartilage, and it was extended for about three inches. The hemorrhage was only ordinary. Within this hard sac there was a small body covered with a membrane. Dr. Wyeth had never seen anything like it before. To facilitate further cutting, as well as to find out what the body was, a strong light was reflected into the cavity. The surgeon glanced within and turned away in dismay. And well he might, for there in full view was a miniature heart beating with great energy. The venous and arterial systems were perfectly developed, though on a small scale, and, as far as could be judged, extended through the entire body, independent entirely of the heart in the chest. Dr. Wyeth did not cut any further, though he would certainly have liked to see what effect the removal of the auxiliary heart would have had on the patient. A photograph was taken of the heart with a detective camera before closing the wound. In examining the cartilage it was discovered that the irregular formation of its surface was due to the existence of small ribs, which nature had thrown

around the heart for protection. The wound was sewed with silk, and beyond a slight inflammation has not given any trouble. The swelling in the neck, of course, can never be reduced, but there is nothing to indicate that it will ever prove detrimental to the boy's health.—*N. Y. Cor. Globe-Democrat*.

DON'T DISGUISE THE TASTE OF MEDICINE.—Disguising the taste of medicine in taking it detracts from its value. If you wish to get the best results from a medicine, do not rob it of its taste. The first effect of any medicine administered through swallowing is of a magnetic or dynamic character. This is occasioned by the influence the medicine exerts upon the network of sensitive nerves that lines the throat and back part of the tongue. These delicate nerves stand as sentinels or outposts to warn the various nerve centers throughout the body of the presence in the palate of any foreign substance. Instantly certain nerve centers become agitated, and that portion of the system under their immediate control feels the effect of the medicine before it reaches the stomach. Especially is this the case with bitter medicines. But when we disguise the taste with sugar or other palatable ingredients we deceive the nerves and the medicine passes the throat without imparting a dynamic effect. As proof of the correctness of this theory, it can be shown that certain cathartics will move the bowels by simply placing them on the tongue for a moment and then spitting them out.

LOBSTER IS DANGEROUS OUT OF SEASON.—An experienced fisherman at the seaside told an Albany gentleman not long since that he did not believe a lobster was fit eating for any one in summer. He said the only time to eat lobster was in fall and winter, and that he had known many instances where persons had been made sick by eating lobster in summer. The statement recalls the fact that was brought to the attention of another Albany gentleman, that Colonel Perkins, the famous Norwich, Conn., centurion, who died recently at a hotel near New London, was a victim of lobster. The Albanian was a guest at the same hotel. The centurion on his arrival at the hotel ate a very hearty supper in the evening and partook freely of meats and vegetables, and also ate a quantity of lobster. Within a short time he was taken sick with what appeared to be cholera morbus and never rallied.—*Albany Journal*.

USEFUL INFORMATION.

The Metal in Solomon's Temple.

That there was more metal in the Temple of Solomon than was ever collected in any other building, we take to be an historical postulate. But it still remains to be asked: How was so much metal cast? With what molds did the Hebrews manage to do it? Where did they perform their operations? As to molds, it seems evident from the Scripture accounts that clay mixed with sand was the molding material. In our own time this is esteemed the safest mold. But what a vast series of furnaces must have been required for such operations, and how harmonious must have been the action, the outpouring from the molds, to produce the giant unity of design! Was there a national foundry on the plains of Jordan before the Jews were carried captive to Babylon, and did Jeremiah allude to it as having been "repaired" at the time of the restoration of the temple? Possibly this may have been so. But we must remember that the Phoenicians were the main founders and workers for the mighty King Solomon, who remunerated them; that as the tabernacle owed much to Egyptian arts, so the temple owed much to Phœnician merchandises. It may be doubted whether the bronze wonders of the temple were not a good deal more foreign than home-made. Jerusalem became the focus of the world's industries, because its king was the master of the world's intellect. "But Solomon built him an house" is only a graphic way of saying that he used his intellect and his influence for the combining in one storehouse all the glories of his profoundly artistic age. *Ad majorem dei gloriam* was the motive of the assemblage, but art and commerce brought the "sinews," if not the homage.—*Ironmonger, London*.

THE RAILWAY AND TELEGRAPH IN JAPAN.—The Japanese have railways connecting Yokohama with Tokio, and another from Kobe to Osaka and Kioto, both routes of the first importance to travelers; and these lines will be extended to all parts of the country, but the work of construction is not pushed with vigor. In telegraphs, too, Japan is making good progress. She has two lines connecting with Europe, one passing by Hong Kong and India, the other by China and Siberia. There is now a question of establishing another line, passing by the Hawaiian Islands and America.

SHODDY IN GERMANY.—Germans are said to take the lead in working up old woollen rags. When properly prepared for re-spinning, this material has been christened "artificial wool" instead of "shoddy." A very large business has recently grown up in that country with this material, which is manufactured from old hosiery, flannel, woollen goods, tailor's mungo, old clothes and rags. From reports published it appears that Germany has for the past eight

or nine years annually imported on an average about 7000 tons of this commodity, and has for some years annually exported nearly 140,000 tons a year. The import duties levied on the importation of chevots into Germany eight years ago have largely stopped the trade between Great Britain and Germany in this shoddy, which was formerly used for making waterproof garments, etc.—*Draper's Record*.

MENDING OLD WINDOWS.—One of the worst jobs the "all-around" repair hand has to contend with is the mending old windows. Putty comes off hard sometimes, and often the sash will be split and badly damaged in the attempt to chisel off the old putty. Once in awhile very old sashes are found the putty on which has a large proportion of white lead mixed with the whiting. Such putty can hardly be removed with a chisel without taking wood with it from the sash. When time can be taken—say over night—it will help to cover the sash thickly with a paste made from three parts of lime, one part of potash, and a sufficient quantity of water. If this is done, and the sash laid one side for 10 or 12 hours, the putty can be removed without breaking the glass—a job not easily done by any other means. A slush of this same mixture can be plastered on some of the grease-drowned jobs which every repair-man must tackle. A liberal coating left on over night and an application of water from a hose under 60 pounds pressure will have a most magical effect.

TO IMITATE OLD BRONZE.—The repeated applications to copper or brass of alternate washes of dilute acetic acid and exposure to the fumes of ammonia will give a very antique-looking green-bronze; but a quick mode of producing a similar appearance is often desirable. To this end the articles may be immersed in a solution of one part perchloride of iron in two parts of water. The tone assumes darkness with length of immersion. Or the articles may be hoiled in a strong solution of nitrate of copper. Or, lastly, they may be immersed in a solution of two ounces nitrate of iron and two ounces hyposulphite of soda in half a pint of water. Washing, drying and burnishing complete the process.

PROCESS FOR PRODUCING SURFACE DISCOLORATIONS.—A German company has patented a process for producing surface colorations upon articles made of copper, zinc or brass. Upon the first-named metal it is possible to develop all the color of the rainbow, and upon zinc the coating is formed of such thickness as to permit of chasing the surface. The most important application of this invention seems to be in the imitation of antique bronze, the results in this direction being very satisfactory, both in the matter of durability and resemblance.

UNDERGROUND TELEGRAPH WIRES.—In London not one of the 1700 lines of wire entering the Central Telegraph Station is above ground. In New York the wires will soon be all sunk. The fire department has contracted for cables for the underground service; the Brush Electric Light Company are drawing their first cables into the Broadway conduits, and the East River Electric Light Company now use an underground cable.

TO MAKE A GOLD SOLDER. the following proportions for 100 parts are recommended by an exchange: Silver, 54.74; gold, 11.94; copper, 28.17; zinc, 5.81. Melt the first three metals together in a covered crucible; when the cover is slightly cooled, add the zinc a little in excess of the proportion given, and stir up the alloy continually. This solder runs very easily, and is much esteemed by manufacturers.

STRENGTH OF CAMEL-HAIR BELTING.—According to experiments recently made at the Royal Polytechnic School at Munich, the strength of camel hair belting reaches 6315 pounds per square inch, while that of ordinary belting ranges between 2230 pounds and 5260 pounds per square inch. The camel-hair belt is said to work smoothly and well, and it is unaffected by acids.

THE MOUSE PEST IN AUSTRALIA is much worse than the rabbit pest. The climate is so soft that they have thriven enormously, and there is said to be "hardly a residence or store that is not pestered by the plague, while from every side come tales of crops devoured so rapidly that many fields have had to be abandoned, what was left not being worth reaping."

THE ENGLISH SPARROW AT HOME.—The English farmers have turned against the sparrow as a pest to agriculture, and are offering rewards for their destruction. It is asserted that these vicious birds cause a loss to agricultural England of \$40,000,000 to \$50,000,000 per year.

EXTENSIVE SALT DEPOSIT.—It is said that enough salt underlies the vicinity of Ithaca, N. Y., to supply the world for a century, and that a syndicate has been formed to build there the largest salt works in the State of New York.

WOMAN IN SIAM.—Of the 15 students sent by the Government of Siam to receive professional training in England, four are young women.

AN AMERICAN COMPANY has leased Aboukir bay from the Egyptian Government to grow oysters.

The Walker-Carter Process.

In a letter to the *Bozeman (M. T.) Courier* a correspondent thus refers to the Walker-Carter process which is being worked in the Red Bluff District:

These facts point out the great want for some cheap or economical system to extract at a profit the values contained in these large bodies of ore. The first sure step in the right direction, as illustrated by the Booz and Appalachian ores, is oxidation—some cheap way of changing these sulphides to oxides. While great results will flow from perfect oxidation, still much loss is experienced as shown by mill and arastra tailings—the saving "hardly ever" giving over 60 per cent of the assay value and generally about ten per cent below that figure. This loss is occasioned by the fine gold floating off and generally known as "flour" or "float" gold and by gold that is "coated," so that it will not amalgamate when brought in direct contact with mercury. This loss and its cause is generally pretty well known among millmen, and many plans have been devised to save these values, but so far without any appreciable success if I except the Walker-Carter dry or vapor amalgamator in operation at this point. I have before me the most positive proof that this machine will save the gold in the class of ores mentioned. I will state a case in point here: During the month of August the Walker-Carter mill at this place, among other dump ores, treated 24 tons of ore from the Red Bluff mine, which assayed \$4.80 gold per ton, making a total value of \$115.20 in the 24 tons, six tons from the dump of the Idaho which assayed \$11 gold per ton, making \$66, and three tons from the Emperor dump assaying \$10 gold per ton, making \$30. The total value of the three lots of dump ore from the three mines mentioned is \$211.20; the cleanup produced a bar of bullion worth \$180, or over 85 per cent of the assay value. It is safe to state that neither the stamp-mill nor arastra could have extracted anything near this percentage, hence it is plain that this amalgamator saves values lost by the old system, both on oxidized surface ores and ores oxidized artificially. Ores treated by this Walker-Carter process in Idaho and the results obtained prove the amalgamator will recover a very high percentage of the gold, no matter how fine it may be or how coated. I have already referred to its successful treatment of Golconda ore, obtaining very satisfactory results without the same being roasted. This mill is in daily operation and any one can make all the investigation desired, and I am satisfied all facilities will be afforded to make the same as searching and conclusive as possible. The main point is that this process is making money from a class of ore thrown away as worthless. It is daily demonstrating that an ore in this section carrying \$10 gold per ton, will pay whether they have to be roasted or not; of course the profit will be greater if roasting can be avoided. The expense of operating the Walker-Carter mill for 24 hours at this point, as near as I can figure, is \$75. This includes oils, lights, loss of mercury and handling. Treating 20 tons of \$10 gold ore and recovering 50 per cent would give a daily net profit of \$85, or in round numbers \$2500 per month. By roasting I believe over 90 per cent can be maintained, but on this class of ore the net income would not be increased, as the cost of roasting would be equal to the extra percentage saved. I figure, of course, on the minimum basis of value in the ores treated. As most of the mines in this section will produce a much higher grade ore, the monthly net output from a 20-ton Walker-Carter mill will be nearer \$5000 than \$2500. When you consider that there are at least 20 gold claims in this district that can in all probability now produce on an average five tons of ore per day each, that will sample and assay \$20 gold per ton, making a gross daily output of \$2000, and that \$1800 of this value can be saved at an actual cost of \$375, not including mining, it means the inauguration of a new era in mining and milling substantial and lasting in its characteristics and beneficent in its results to the whole community—making property, now apparently worthless, valuable and giving an impetus and push to all branches of industry.

STRUCK BY LIGHTNING.—Nature makes use of some rather unique methods in revealing to man the hidden wealth that lies concealed in the bosom of Mother Earth. West Salem, in the Unknown district, has for some time been known to be rich in gold-quartz veins. A stock company has been organized and a 150-foot tunnel run in. About three months ago L. R. Bacon, superintendent of the works, was visiting a neighboring mining camp. On returning home in the evening, he was overtaken by a thunder-storm, and the electric fluid struck the rocks near where he stood, scattering fragments all around him. Next morning he went out and examined the rock and found it gold-bearing quartz. He pulverized and panned a piece of the rock and it proved to be rich in the shining metal. A tunnel has been run 35 feet, and the lode appropriately named the "Thunderbolt." W. T. Coad and J. U. Gridley were appointed a committee to examine the work on the above-named lode and report to the company. Yesterday they returned, and report the rock in the Thunderbolt to be the richest yet discovered in that locality.—*Republican*.

The Trinity-river dam and tunnel have been completed.

Passing Events.

It appears that the Great Falls smelter people are taking Butte ore away from even the Butte smelters. If the Butte sampling men do not bid higher for ore, the Great Falls people will get more of it in future. Ten per cent on the assay value or 10 to 20 per cent for unit value on lead ores is quite an object to the miner who takes out and ships a quantity of ore, and one he is sure not to overlook. The competition will be good for Montana miners.

Just now so much attention is being paid to politics that current mining news is rather scarce. Business generally is dull and is not expected to improve until the excitement of the Presidential election is over.

The long-hoped-for water is expected into Tuscarora district next Monday, when the Navajo

mill will start up. North Belle Isle, Nevada Queen and Commonwealth are now building jointly a fine new mill to cost about \$160,000. A 40-ton furnace is also being built. The new \$40,000 concentrating works will treat 100 tons a day. The new water works cost \$130,000. The mines of this district are now attracting more attention than any other in Nevada, except those of the Comstock.

Lead miners complain greatly of the Treasury ruling under which so much lead ore is coming in from Mexico as silver ore without duty.

The engineers' commission on debris matter has not yet commenced work but will shortly do so.

Mining-Stock Reforms.

An item in one of the daily papers is to the effect that the Stock-List Committee of the San Francisco Board is investigating the claims of the West Chollar Mining Co. before allowing it to be placed on the list.

There is no doubt at all if closer investigation had been uniformly made before listing mines on the stock board the mining-stock business would never have reached the depressed condition which has existed for the past few years. It seems to have been more of a question of paying a specific fee for the privilege than anything else. As a result, "wild-cat stocks" without number have been brought before the public. There have been hundreds of mines that never paid a cent and were never expected to.

The result has been that people lost confidence in the stocks and the boards. The fact that the name of the mine was regularly called, and the stock quoted in the board, was no guarantee whatever that the mining operation was a bona-fide one. It might well have been, however, had the board exercised more discrimination with its list. The board could well have afforded to have at least some sort of examination made of the property.

Another matter, too, should have received attention. That is, the personnel of the officers and managers. There are many promoters who are well known to have played all sorts of dishonest tricks with mining companies. They have purposely mismanaged them; turned most of the money into their own pockets and swindled the stockholders outrageously. The fact that any one of these men had anything to do with a company should justify the board in refusing to list it, or in removing it from the list. Such men are generally well known to the brokers, and their practices understood. The public could have been protected by the board better than they could protect themselves.

But the board fell into an easy-going sort of way and paid little attention to these matters. No thoroughly active steps were taken to reform the business, and the result has been the stock market has fallen in favor and the prices of seats on the board greatly reduced. The fault lies with the board itself. Had they utterly refused to have anything to do with wild-cat stocks and dishonest manipulations, the public would have more confidence and do more business. As it is, the good mines have to suffer for the bad.

A Pacific Coast Relief Chart.

A photoplate of a relief map of all that region embraced between the southern boundary of California, northern boundary of Washington and eastern boundary of Utah has just been issued by the publishers of this paper. It was made from a relief model in plaster, which illustrates the mountains, valleys, lakes, rivers, etc. The original model was made by Isaac Winston and Prof. George Davidson of the U. S. Coast and Geodetic Survey. The model itself is five feet three inches by five feet six inches in size. An orographic model of this kind has never before been made of the Pacific Coast, and the chart shows a facsimile of it. It gives a much better idea of the topography and orography of the region than can be gained by Mercator's projection maps. The idea of a bird's-eye view is conveyed, while at the same time the correct proportions are preserved. The continuous chains and isolated ranges of mountains are shown with the adjoining valleys and water-courses.

Even a slight study of this chart brings out many interesting features which an ordinary map could not show. Take the great interior

basin of California, for instance, one of the largest valleys of the world. It shows here like an enormous elongated bowl, the sides formed of mountain ranges. Coursing through the center of this valley are the Sacramento and San Joaquin rivers, which receive a large part of the drainage system of the State. Their windings may be traced from the source to the sea.

The great backbone of the coast, the mighty Sierra, stands prominently in view, dividing the coast region from that of the great interior.

The configuration of the ranges and mountains can be traced in such a manner that the routes of the principal railroads can be seen as they take advantage of the natural passes.

The coast line is an interesting study in itself. A portion of the ocean-bed is shown, so that the abrupt rising of the land is plain. In places are deep submarine valleys, and again the shoaler submerged land is apparent. The bays, harbors, inlets, river-mouths and islands are also figured.

Numbers are placed on the chart, and a corresponding index gives the names of the principal mountain peaks, lakes, rivers and cities. The course of any large river may be traced winding through the mountains to the sea.

In short, this chart will give any one a very excellent idea of the surface features of California, Nevada, Oregon, Washington, and part of Montana, Idaho and Utah. Nothing of the kind has ever been published before relating to this coast. It is finely executed and printed on heavy paper, 19x24 inches in size, suitable for framing.

Steamer Losses on the Atlantic.

It is a startling fact that within the space of 47 years, commencing with the loss of the steamer President in 1841, nearly 100 fine ocean steamers have been lost in making passages across the Atlantic. Of this number, eight were never heard from after sailing; ten were run down in collisions; five were burned, and three foundered in mid ocean. About 70 have been wrecked upon the coasts of the Atlantic or British Isles. It is generally supposed that most vessels are lost by the violence of the elements in the open sea; but out of the 100 above enumerated only three or four succumbed to such a cause. A large proportion of the others were lost by casualties which it would seem could have been avoided by proper care. Dark nights, dense fogs and miscalculation of distances run seem to have been the primary cause in a large proportion of the casualties. These are conditions which a little more care or slower running might have avoided.

Most of these wrecks were attended with loss of life. In all, 5600 persons perished. With the loss of the Atlantic, in 1873, no less than 562 persons disappeared; with the City of Glasgow 480 went down. When the Austria was burned, 470 were lost. These were the most disastrous losses, although with several others from 200 to 300 and over were lost.

In 1873 no less than six large steamships were lost, wrecked, run down or disappeared. By the Atlantic and Ville du Havre alone, 788 lives were lost that year. This is a fearful record of disaster to human lives, and it does seem as though greater care and provision might be had to avoid such catastrophes. Probably it is to fast running, when danger is liable to be encountered, that the greatest loss is due. Time may be important, but safety and life are more so.

Just now there is great rivalry in speed between the different Atlantic lines. If such rivalry must be kept up, let it be known which company prefers speed to safety, and let travelers choose between the two. There is but little danger in fast steaming in clear weather and an open sea; but in foggy weather and dark nights, with the ocean covered with steamers and sailing vessels as it is now, and nearly all running in one narrow sea-path, slow speed and the most careful lookout are the great factors of safety, and should be carefully adhered to by all passenger-carrying steamers.

RACKAROCK.—From the tenth report of Her Majesty's Inspectors of Explosives (England), it appears that rackarock powder consists of chlorate of potash, with dead oils (heavy mineral oils), nitro-benzol or other liquid hydrocarbons, with or without the addition of sulphur.

Twin-Screw Steamers.

The steamer City of New York, from which so much was expected in the way of speed, has thus far proved a decided failure for swift steaming. The special interest invoked was the experiment of twin screws. Many argued that they would not show any decided advantage over the single screw. Her first trip and return showed that the vibrations caused by the working of her two powerful engines were too severe, and led at one time to the necessity of slowing down and a final stoppage of the engines, which remained at rest in the open sea for over two hours.

There is no question but that twin screws have proven a success in a certain class of steamers—merchant steamers and ordinary men-of-war. We have the record of an English paddle-wheel steamer which was recently changed into the twin-screw type, the result being to increase the carrying-power of the vessel by 190 tons, large additional cattle-carrying space being gained by utilizing the room occupied by the paddle-wheels, while the net register was decreased 247 tons. The speed was also considerably increased and the fuel consumption greatly decreased.

It is believed by many engineers of repute that eventually the twin screw and triple engine will be found as successful on fast passenger steamers as it has proven to be on slower vessels. It is seldom that any great departure from established practice meets with success at the outset.

The standard of efficiency which has been reached by side-wheel steamers and the single screw has been attained by slow and gradual growth. One improvement after another has been added, until a high degree of excellence has been attained. Very few of those who have watched the development of any new principle applied to engineering will conclude that the twin screw principle, as applied to fast steamers, has proven a failure by reason of the thus far failure of the City of New York to reach the anticipations of what was expected of her by those who are in too much of a hurry to await future developments.

The wonderful record recently made by the Etruria was not realized until she had been running several years and her machinery had been carefully worked and perfectly fitted to its parts. The machinery of the City of New York is yet in the hands of its builders, and will be for several trips to come, and it is more than probable that modifications will have to be made before final and satisfactory success has been attained.

The Russell Process.

In this number of the PRESS we conclude the article on the "Russell Process," which was commenced in this number of July 20th and has been continued from week to week. The paper forms a valuable contribution to modern metallurgical knowledge, describing as it does in detail experiments and results obtained under varying and different conditions. Many of the tables give important comparative results only arrived at by exhaustive practical experiment.

What is of great interest to miners of precious metals is the comparative statements with relation to amalgamation and lixiviation. The old lixiviation process, as conducted by Patena, Kiss, Kustel and Hoffman, had defects which made it inapplicable to certain ores. The Russell process has overcome the defects of the ordinary process, and, since its introduction at Silver Reef, Utah, in 1884, it has gradually grown in favor. As to its advantages as compared with amalgamation, these have been detailed in the PRESS. In fact, to quote Mr. C. A. Stetefeldt, who has recently published an excellent work on "Lixiviation": "The lixiviation of to-day is essentially the Russell process in one or in all its features."

We have devoted a great deal of space to this process, in order that our readers might obtain all the details. Great interest has been manifested by the mining community in leaching, and we have from time to time given more or less concerning it in the PRESS; but the opportunity has never before offered to present its features so fully.

At the meeting of the Technical Society of the Pacific Coast this week, Miraden Mansoor, engineer of the Harbor Commission, read a paper on "Swamps and Marsh Lands of California."

Refining Sugar by Electricity.

Are We to Have a Revolution in the Sugar Business?

Various hints have been thrown out during the past 10 or 15 years in regard to a new and cheap process for refining sugar by the use of electricity. Quite recently, the subject has taken on a more practical shape by some alleged experiments in Brooklyn, N. Y., where large quantities appear to have been successfully put through the process. The experiments were made at the residence of the inventor, or, rather, his representative, for the inventor himself recently died. The house, it is said, was carefully examined to see that there was no large quantity of refined sugar on the premises. Nothing was overlooked, except a large pile covered with canvas, which the searchers were assured was a portion of the machinery used in the process. Forty barrels of crude sugar were then taken into the house and put into an upper room, while it was, in the presence of witnesses, gradually emptied into a "hopper," from which it passed through an intervening room below, in which was the alleged machinery, and thence to a third room, where it came out in a condition of absolute purity in three different assorted grades or sizes of crystals. The appearance of the sugar was quite different and superior, in fact, to that which is produced in the ordinary way.

The Process a Dry, a Cheap and a Secret One.

It is claimed that the process is dry—that the sugar is not dissolved in water, as is done by all other methods, and that there is no waste in molasses or syrup; that all the saccharine matter forms into crystals of pure sugar. If this is a genuine process, it is certainly a most wonderful one, and exceedingly inexpensive. The raw, dark sugar of commerce is elevated to the top of a building, shoveled into hoppers, and, inside a half hour's time, the same sugar, in dazzling white crystals, is pouring from a spout on the lower floor in assorted sizes, absolutely pure, with a continuous stream running as long as the feeding continues. All the saccharine matter is converted into crystallized or granulated sugar without being dissolved, or the use of bone-black for purifying, as by the old process of evaporation. It is reported that this experiment was made under the eyes of experts and capitalists, who, upon the results, have resolved to put up a five-story building in Brooklyn, with machinery of a capacity to refine 4000 barrels daily. The cost of refining by this process is reduced about two-thirds—or, say, from six to two cents a pound—besides saving a large amount of sugar which is wasted or greatly reduced in value by the existing process. Indeed, it is said that a refinery, with a capacity of 1000 barrels a day, can be erected and put in working order by this process for \$100,000; while a refinery of the same capacity, to work by any of the existing processes, would cost \$1,000,000. Thus far, the process is a profound secret. It has not been patented; its details are not known, and have never been seen by those who are putting up the money for it. They know nothing but results. They do not even know but what the pile of alleged machinery, which the experts saw, was a pile of refined sugar, with which to deceive them by running it down into the room below, while its place was taken by the crude sugar from the room above.

The Reported Success Creates a Great Excitement.

Sugar merchants, brokers and refiners all over the world appear to be in a great flurry at the recent reports published in regard to this alleged discovery. If this is a genuine and practical process, as claimed, and can be worked so cheaply and as well as reported, it will create a complete revolution in the sugar business of the world and greatly reduce the price of that universal article of household consumption. It is said that the parties allied to, who are about to put up an extensive refinery in Brooklyn, consist of English and American capitalists, representing at least \$15,000,000, and that they are prepared to erect electric refineries in all the principal cities on both continents. This system it is said has been in process of development for the last 10 or 15 years, but it has so repeatedly failed in accomplishing its purpose that the faith of those who at one time believed in its ultimate success was so frequently shaken as to create a prejudice against it

and eventually secures the condemnation and amasses the incredulity of its erstwhile advocates.

Pacific Coast Refiners Incredulous.
Our San Francisco capitalists who have an immense amount of money invested in the pres-

holders. If the English investors have taken the bait prepared so alluringly they must be ready to bite at anything.

"Some time ago we received a small quantity of sugar that purported to have been refined by electricity. If it had been produced

from Havre. On that account he reported adversely. Under the circumstances we don't think there is anything in the new method."

Gus Spreckels simply expressed a lack of interest in the electric method. He had seen samples that purported to have been produced by the Brooklyn concern. They were all of merchantable sugar which would command ready sale anywhere. Mr. Spreckels said he had not been offered the right for the Pacific Coast, and was not anxious to acquire it until some more light was thrown on the subject.

Is It Another Keely Motor Affair?

The methods of the operators are about the same. Nothing of the process is shown. The whole thing certainly has a very suspicious appearance. They claim that it is a dry process. How can pure sugar be crystallized out of a dry mass of crude sugar? In the laboratory, in the factory, in nature—everywhere—all things crystallizable are crystallized out of a solution, either liquid or gaseous. Has this wonderful inventor discovered a new principle in nature? If a streak of lightning or artificial electricity in any manner produced, is passed through masses of dry or merely moist sugar, the effect is the very opposite of anything like crystallization. The sugar or other material is rendered still more amorphous and more difficult to crystallize. If we take a solution of anything crystallizable and place it in a magnetic field—that is, in a space where electricity may be carried around it by means of a coil of wire, or in a locality in close proximity to a powerful dynamo—crystallization will be rapidly set up and very large crystals, and of very perfect form, will result. Crystals may thus be very rapidly formed from a liquid solution. But if we take the same substance in a dry pulverized form, a magnetic action will be set up, and the pulverized material will be moved from its natural condition and arranged in geometrical forms, varying according to the nature of the material or force of the magnetic action set up; but nothing in the way of crystallization will take place. Sugar in solution can be refined and crystallized by electricity—by placing the solution in a magnetic field; but so far as is known not on an economically practical scale. The conversion of a mass of crude sugar into pure crystals without first putting it into solution, is too much to ask one to believe. We would sooner risk our money in the Keely Motor scheme. San Francisco sugar-refiners are wise in waiting for further developments before abandoning their present processes.

Disposing of Sawdust—A Growing Industry.

Lumbermen have always found the disposition of sawdust and waste lumber at the mill a source of great annoyance, cost and labor. Where water is plenty it has been run off down the stream; but complaints loud and imperative have come to the mills by reason of the floating sawdust nuisance polluting streams and otherwise seriously injuring riparian owners below the mills. Courts have granted injunctions, staying such a disposition of the waste products.

Large furnaces of open or basket ironwork have been built, into which the waste material has been dumped, and thus consumed, as it is neither safe nor practical to burn it in heaps upon the ground.

But a still better idea has recently been put in practice of saving instead of destroying such waste. A late number of the *Industrial Journal* describes this machinery and process as follows:

At the sawmill is erected a tramway, and along this runs on wheels a box-shaped receptacle or curb in which the material is pressed. The entire outfit weighs about 2½ tons, and requires a space about 20 by 30 feet. When the work of pressing begins the sawdust or other material is dropped into the receptacle, and by means of power either from a water-wheel or engine a pressure of 125 tons is secured. It is plainly evident that no covering of cloth, unless it be of metal, can withstand such pressure, and just here comes in one of the notable inventions connected with the machine.

By a peculiar arrangement, which has been patented, a metallic case is so placed inside the curb and inside the hurlap, which finally forms the covering to the bale, as to enable the removal of the matter pressed after it has been confined by wire or rope. The curb is so devised as to open at all four corners, allowing the bale to drop to the floor or ground, leaving the curious lining inside. Then by a motion of the lever the curb is closed, new binding material inserted, and the whole apparatus ready to go

Fig. 9.

IMPROVED IRON STILL USED IN THE MANUFACTURE OF SULPHURIC ACID.

ent mode of sugar refining, do not seem to be much alarmed over the prospect. They say they expect a change when the millennium appears, but are not disposed to investigate the subject any further just now. To a reporter of

in the regular way it would have been sent back, as the samples showed what is technically known as a 'false grain,' which unfit it for consumption."

"Are you investigating the process?" asked

SECTION OF FIG. 9.

the *Examiner* of this city, Supt. Barr of the American Sugar Refinery recently said: "This alleged electrical process is several years old. Articles describing the process have appeared off and on in the *Sugar Cane*, published in England, during the past four years. The trade knows nothing of the business, as no information can be obtained. The scheme has always been regarded as a sort of Keely motor affair, owing to the great secrecy observed and the fact that information is withheld from stock-

the reporter.

"No; we are willing to abide by the report of a French expert who was sent, out from France to examine the plant at Brooklyn, N. Y. The right to manufacture sugar in France has been offered to Say's refinery for \$1,000,000. Before closing the deal, Mr. Say demanded an explanation. His expert was denied admission to the building, and when he left New York to return to Paris he knew no more about the application of electricity than when he first sailed

through the operation again. Two carns can be used advantageously to one press, and two men can operate a curb.

Sawdust when haled in this way becomes so compact as to be well-nigh impregnable, weighing 325 pounds per bale. These bales measure about 24x28x36 inches, and are readily taken by transportation companies at the lowest rate of freight. If the sawdust be moist when haled it will speedily become dry, the bale all the while remaining firm. And another peculiar feature is that the sawdust, even after being subjected to this great pressure, falls apart like meal on being opened, the particles not adhering together.

The machine is intended for the compressing of sawdust, shingle hair, refuse wood and bark, and in fact everything in the shape of waste coming from sawmills, box factories and all kinds of wood-working establishments. Hemlock bark can now be ground where peeled, pressed into bales, and thus distributed to tanneries at a large saving in the cost of transportation.

Refuse from mills, such as bark, sticks, etc., can be baled in the same manner as sawdust, and as that no covering is used, it only being necessary to put salt on the top and bottom of the bale. It is not difficult to see that the machine may have a marked effect on the kindling-wood industry. Millmen who have heretofore found the removal and destruction of such refuse attended with considerable expense can confidently expect hereafter, without any additional outlay, to get the same baled and ready for market.

COTTON AND WOOL.

Decreased Imports of Cotton Goods.

The decrease in the imports into this country of the finer classes of cotton goods illustrates the rapid improvements which this country is making in such manufactures as lawns, satens, etc. During the ten months ending April 30, 1887, nearly 3,000,000 yards of foreign uncolored cottons were imported. In previous years the total was much larger. For the ten months ending April 30, 1888, the importation amounted to only 917,000 yards. This falling off is due to constant improvements in the character and wider variety of the fabrics produced by American manufacturers. The New York *Commercial Bulletin* of a late date says that the finest foreign productions can now be duplicated on the machinery on this side of the Atlantic, and, with the aid of the duty on the European article, at a lower price than the latter can be imported. Hence, while it is the fact that the sale of "white goods" in this country this season has been of enormous volume, importers have been unable to sell more than one-third of the moderate quantity they brought over and marketed a year ago.

While different in some particulars, the data of importations of colored cottons are equally as interesting. The most striking point shown is the fact that while more satens, etc., have been not only made but marketed by American manufacturers this year than ever before, the importations of similar foreign goods have increased considerably. Thus, during the ten months ending April 30, about 24,162,000 yards of foreign colored cottons were landed on the American shores—a total that is nearly 1½ million in excess for that of last year. The domestic production discloses finer work this season than ever before, and in some instances the best goods make a novice discreditable showing in comparison with the famous Mnlhouse productions. It may be stated without hesitation that the drafts upon the foreign market have not been due to inferiority of American goods. The fact is, that the American machinery employed on that class of fabrics, although larger than ever before, has not been sufficient to turn out enough goods to meet the demand.

Lubricants for Wool.

There appears to be some differences of opinion in regard to the value of different lubricants for wool. Two of the principal essentials for a lubricant for wool are care and economy of scouring and freedom from a tendency to heat and thereby cause spontaneous combustion. A cotemporary says: The claim that lard and olive oils are superior to mineral oils is open to dispute. The higher price of the former renders the temptation to adulterate them greater, but supposing there was no difference in price, mineral oils have certain advantages over animal and vegetable oils which should not be overlooked.

First, as to body. The claim that mineral oils have no body is not valid, for the finest cylinder and valve oil, the finest machinery and spindle oils, the finest hot-neck and crank-pin greases, even the thick, heavy-bodied grease, used to daub the sides of ferry-slips, and, in short, most lubricants for machinery, heavy and light, fast-running or slow, are made from the "product of the oil wells." A mineral oil, by a simple process of reduction, as one would build down molasses candy to make it thicker, can be made of almost any thickness of body. In this respect mineral oil can be made to fully "fill the bill" as to the first two essentials. First, sufficient fluidity to secure thorough distribution; and, second, body enough to prevent running when the stock remains in bulk.

Second, as to gumminess. When any oil is distributed over the surface of the wool, it is

brought closely into contact with the oxygen of the air. All animal and vegetable oils are oxidizable by such exposure, some slowly, some more rapidly, and some so rapidly as to cause heating. In this respect lard oil is not absolutely safe, yet the danger is slight in the case of the purest and best winter-strained oil. Olive oil is demonstrably dangerous. Mineral oil is absolutely unaffected by the oxygen of the air in this way. It does not gum and does not heat; so that, in the third essential mentioned, it also "fills the bill." As to the fourth essential, which is of the least importance, and can be allowed for in process of manipulation, which has to be done where moisture is used, for that evaporates more rapidly than any oil, lard and olive oil answer the purpose so far as "staying there" is concerned; but when we reflect that the longer they are allowed to remain on the fiber, the more firmly they become attached to it and the harder it is to scour them off, while the slight evaporation from a first-class mineral oil of 400° test only makes it easier to scour out and make it a more perfect lubricant, we must conclude that the advantage still lies with mineral oil. As to scouring. All animal and vegetable oils require an excess of alkali in the scouring fluid. Without such excess they cannot be scoured at all. Alkali is injurious to the fiber. Sufficient alkali will dissolve wool fiber altogether. The less used the better. Mineral oils scour by their affinity for the grease of the soap. They scour more easily in a cold neutral soap than in a hot strong soap. Which would appear to be the best oil to use—animal, vegetable or mineral?

In conclusion, mineral oil is steadily superseding lard oil and olive oil. It would succeed more rapidly if it were not that oil dealers, who do not understand the essentials of a good wool oil, foist some light, thin-bodied oil, or mixture of nasty grease and light oil, on the inexperienced manufacturer, and so do both themselves and the manufacturer serious injury. The remedy for this danger is to go slowly, study and experiment cautiously, and having found out how to tell a good mineral oil from a bad one, or rather a proper from an improper one, buy from responsible parties only.

The American Wool Industry.

Hon. Wm. Lawrence of Ohio, one of the best authorities on the wool industry, has a paper in the *American People* to show the amount of wool annually required for consumption in the United States; that under a tariff reasonably protective, American wool growers and manufacturers can produce all the wool and woolen and worsted goods our people need; and that free wool will practically destroy the wool industry of this country and give foreigners a monopoly of wool production.

The number of wool-growers in the United States is estimated at about 700,000; fully 500,000 persons are employed by them, and hence, if to this there he added their wives, children and other dependents, at least 4,000,000 persons, or about one-fiftieth of the population of the United States, are more or less interested in the growing of wool. Besides, there is a great number of farmers—estimated at 150,000—who keep a small number of sheep, but who could not be fairly classed as growers of wool.

The number of sheep is estimated at 50,000,000, and the crop of wool at 350,000,000 pounds, worth \$77,000,000.

There are sold annually from 13,000,000 to 15,000,000 sheep for mutton, worth about \$3 per head, making the total value of wool and mutton sold each season about \$122,000,000. It is a vast industry, in which every State, and almost every county, is interested.

The rapid increase of American wool-growing and wool-manufacturing under protection is shown in the appended table:

	1870.	1880.	1870.
Wool clip, lbs.	60,000,000	162,000,000	232,000,000
Wool m. n's.	\$65,596,000	\$172,495,000	\$267,252,000

"To check the magnificent growth of this great industry," says the *American People*, "so beneficent in all its results to the entire country, would be criminal. To destroy it would be worse than treason."

France grows but 25 per cent of the wool she uses.

This country furnishes one-sixth of all the wool grown throughout the world.

The United States is the second wool-producing country in the world.

Eighty per cent of the wool used in the United States is produced here.

Wool-raising is the only great farm industry in the benefits of which every section shares.

The annual value of the wool crop is from \$75,000,000 to \$90,000,000, varying with the market value.

The United States is the only civilized country in which, in recent years, there has been a large increase in the production of wool.

The wool clip of the United States increased from 60,000,000 pounds in 1860 to more than 300,000,000 pounds in 1884.

Wool growing is the sixth in importance of the agricultural industries in the United States, and is surpassed only by corn, wheat, cotton and oats.

The consumption of wool in the United States increased from 1870 to 1880 about 70 per cent. The population increased in the same time but 30 per cent.

The average weight of a fleece of wool in this country in 1860 was less than three pounds. In 1870 it was 3½ pounds; in 1880 it was 6

pounds. In 1880, in Great Britain, it was 4 pounds.

The quantity of foreign woollens used by our people per capita decreased from \$1.35 in 1859 to 35 cents in 1879, while the consumption per capita of American woollens increased in the same time from \$2 in 1859 to \$5.34 in 1879.

OUR EXPORT OF COTTON GOODS.—The quantity of colored and uncolored cotton goods, of domestic manufacture, exported from the United States in 1887 was nearly 204,700,000 yards, over two thirds of which consisted of uncolored goods. This was the largest exportation of cotton goods for any one year ever shipped from our ports. In 1866 the exportations amounted to 3,448,000 yards, and in 1880 to 106,580,000 yards.

GOING SOUTH.—Many of New England's skillful cotton operatives seem to be taking situations in Southern cotton factories, and we occasionally receive letters from them expressive of much satisfaction with their new positions and the beauty of the country.

SHOP NOTES.

Count the Cost.

Everything, no matter how small, has some value. Everything used about any shop, mill or place of business costs something, and no matter how small it is, or how little it costs, it should in some way be accounted for. Everything purchased should be thoroughly weighed and its value noted. The price paid for a thing is not an exponent of its value. Its value consists in the return it brings. A hook, paper, machine or appliance is of no kind of value to its owner unless it gives him something in return, or renders an equivalent for time or money expended, and we should "count the cost." A thing we cannot use, and consequently is of no value to us, is dear at any price.

Before buying any machine we should see it, or its duplicate, working under all the conditions the machine is calculated to work under, and in no case buy a second-quality tool or one that will do a small amount, or an inferior quality of work. The cost should be counted, and if more is paid for it than it will return to us in work performed, it is a dear purchase.

The cost should be counted in buying belting. A poor belt is costly at any price, for it never runs well or pulls well, and costs more in time to lace and relace and patch than two or three good belts would in the end. Lacing should be carefully selected.

The first cost of anything is a small item, and not a single thing should be bought because it can be bought "for a mere song." What will it cost to use or run it, comparatively? If it is a machine, count the cost of oil, belting, time spent in repairs, and amount and quality of work done in a given time, and compare it with another machine doing the same kind of work.

In buying files there should be a close discrimination, for files are curious things to buy. There are thousands of them so poor that a junk-dealer would not run the risk of stealing them, for the cost of carrying them to his piles of old iron would be more than they were worth. The only way to get good files is to count the cost of using, and get hold of some firm who always furnish a first-class file, and stick to them. Don't ever buy, or borrow, an acid-recut file.

Count the cost in hiring labor, and be careful in selecting it. A man may be a good man for somebody, but not for you. A man to be of value in any particular business must be adapted to it and be able to do it with ease and dispatch. Simply because he is a man is no sign that he will be of value to you as an employee. Count the cost of everything in the sense of what value it will be to you in using.—*Wood Worker.*

SHOP NOTES.—A reversible pulley, either for screw-cutting or for any other purpose, must invariably have a loose pulley on either side, and the driving pulley on the shaft above must have surface as broad as all three, in order that the belt may have it full face-power. Since the introduction of absolute fixed gauges of exact sizes into the machine shops in place of the universal calipers there has been a steady improvement in the quality of work, particularly of machine tools. Accompanying this improvement there has unquestionably been another—that of the workman. Both are evidences of progress in the right direction. The use of straight edges, surface plates, solid, hardened steel gauges, rings for external and plugs for internal diameter measuring, and measure pieces and thread gauges, demand the practice of exactness on the part of the workman and tend to insure exactness in the result of his work. If a shaft is so far "out of true" that a straight line from center to center of the length falls at any point outside of the diameter, it must be taken to the forge before being trued up on the lathe.

SHOP MOUNTING FOR BLUE PRINTS.—A correspondent of the *American Machinist* suggests the following cheap plan for mounting blue prints for shop use as one which has proved satisfactory in the absence of anything more elaborate or expensive: We send either blue prints or cheap pencil drawings to the shop, the latter when we expect to

make only one piece of that kind. We take the sketch or print to the circular saw sorap-box and pick out a couple of convenient strips, say 1" to 1½" wide x 3 16" to 4" thick, and as long as the blue print, tack them together with small brads, the upper edge of the print being caught in between them; two gimlet holes and a piece of heavy twine complete the job, and we have a light, handy and inexpensive mounted drawing, 50 of which can be hung on a common hook, if so desired, and selected as wanted. We suggest the plan as a shop kink to those who may feel disposed to make use of it.

GRAPHITE AS A LUBRICANT.—The use of graphites, sometimes styled plumbago or black lead, is becoming greatly extended as a lubricant, for the lessening of friction and heating of journals. For this purpose it is growing rapidly in favor. For lubricating purposes none but the very best plumbago will answer. It must be pure and free from grit. This purity is attained, not by bolting it, but by floating the plumbago in either air or water. The water method is simplest, and during this process it is treated with a bath of dilute sulphuric acid, which takes up the particles of spar and iron, leaving the sulphates of lime, magnesia and iron easily washed out. For metal bearings the plumbago should be used with oil, but for wood bearings, after a few applications of oil and plumbago, the oil may be dispensed with and the dry powder only used. On hot axles or journals, it should be applied freely dry, then oil up as usual. Although plumbago was used for this purpose more than 200 years ago, the true method of preparing it was not known until within a few years, so that it comes before the public almost as a new material.

STEAM BOILER NOTES.

Portable Engines.

The builders of portables engines have one very serious disadvantage with which to contend, and a disadvantage which they cannot overcome. Their engines go largely into the hands of men who have had but little or no experience in running and caring for a steam engine. There is no encouragement for a builder to put a fine finish on such engines, because they would never have the "dope" wiped off them by the buyer, to say nothing about their being kept clean afterward. Neither is there any use in making a nice fit of the crank and cross-head brasses because the first Sunday job of the amateur engineer will be to key them up and spoil the fit by slackening them up before he can start Monday morning. In nine cases out of ten one-half of the trouble is caused by ignorance and the other half by the pretensions of the engineer (?) in charge. The builders realize this, and because one seeks to get around the trouble by making his engine with a large cylinder and slow piston speed, and another tries to obviate another objection by making his engine light and running it fast, they ought not to be "blowed up" for the apparent discrepancy. The discrepancies which are vastly more harmful and dangerous are the discrepancy which lie between good workmanship and the ordinary workmanship on portable engines, and the discrepancy between ordinary intelligence and common sense and the ignorance and stupidity of the average engineer.

Whether it is better for an engine to be made large and heavy and develop the requisite power at slower piston speed and moderate pressure, or whether the same power should be gained by faster speeds and higher pressures, in order that the engine may be lighter, is an open question, though one thing is certain, viz., that there are many engines running to-day at piston speeds which would have been deemed impossible a few years since. In the case of portable engines for farm purposes it may be set down as an axiom that the boiler pressure should be kept as low as possible, and this is best done by having both boiler and engine of good size. There is nothing to be gained by making a portable engine too light or too small, and there is a direct loss in economy and a material increase in the risk of operating them.—*Wood and Iron.*

HIGH SPEED ENGINES.—A cotemporary, in alluding to the very high piston speed which is occasionally employed at the present time, says: "This rate of speed has been carried about as far as the present state of mechanical perfection will allow. With a theoretically perfect machine, there is no difficulty in getting almost any piston speed desired, but in practice the bearings will heat and bedplate spring, until the theoretically-admirable machine is anything but satisfactory to its purchasers, who want a steady, reliable power from 10 to 23 hours each working day of the year. The Porter-Allen high-speed engine has been much talked about by engineers and mechanics of advanced ideas, and it is probably the best-built machine of the kind in the market, but it is by no means an assured success, for the reasons mentioned; and if our esteemed contributor osres to take a short journey, we can show him a pair of them which strikingly illustrate the difficulties in the way of getting unlimited power from a small machine by the 'doubling pressure and number of revolutions' plan."

OUR LUMBER INTERESTS.

HUNTERS IN MAINE LUMBER CAMPS.—A correspondent of an Eastern journal who is familiar with the Maine lumber camps writes as follows: "In the far-back camps, where big game is abundant, they have found one or more hunters who are barbed, with free board, for the sake of having fresh meat provided. The hunters are paid \$4 per hundred pounds for the dressed meat delivered at the several camps. The hunters set lines of traps for fur and cover a great extent of territory, reaching far beyond the operations of the lumbermen, where game, especially moose, seek uninterrupted grounds. But in most camps some of the men have rifles and on Sundays go hunting, and a great deal of game is gotten by them, but mostly deer and caribou, especially the latter. In crusting-time these men kill many moose also. I will relate some facts I learned on my last trip this summer. One hunter shot 12 moose, not to speak of deer and caribou; and another man in the same camp shot 3, and of these 15 moose the meat of only 3 was saved. Another hunter shot 8, another 7, and two others 4 each. Here are 38 moose shot by 6 men in and about the works of two operators only. Now there are a score or more of operators in the country as well stocked with big game as those mentioned. My trips every summer cover territory not visited by sportsmen, and embraces 100 miles or more of main streams and small tributaries. I visited eight camps, and at all of them were seen moose legs, heads and pieces of skins. More than this, I saw and talked with some of these very hunters and men who worked in the lumber camps. Every season till this I have seen live moose every day while in that section, some days several together; but on this last trip I saw three all told, and not one track to where I used to see dozens. This tells the whole story, and if next winter should be as favorable for crusting as the last past, the moose will receive their quietus, or nearly so. From present indications greater operations are planned than those of last season."—*Forest and Stream.*

A BIG LUMBER SCHEME IN OREGON.—A Michigan syndicate appears to be buying up a large quantity of timber land in Oregon. The *Astorian* of Oct. 5th says: Considerable activity is displayed in filing on timber land, large quantities being filed on in 160-acre tracts at \$2.50 an acre on both sides of the river. A Michigan syndicate, worth, it is said, \$12,000,000, are buying up an entire township. Township 7 north, Range 7 west, back of Knappa, getting all they can from probasere who have secured a patent from the Government timber land. Just whether they intend to build a \$150,000 sawmill, or gobble all there is in sight and hold it for the next 20 years, is not at present gettable, as a syndicate doesn't get out a brass band, nor come to a newspaper office the first thing, but the *Astorian* has it straight that a combination of Michigan capitalists, who know a good thing when they see it, are getting hold of all the timber land they can get a clear title to back of Knappa. Some of the timber land is a wonder, many 160-acre tracts having 10,000,000 feet on each of them. The syndicate is getting bonds for deeds for the space of 60 days from many of the owners of 160-acre tracts. Ten dollars an acre is reported to be the ruling price, though \$25 in some cases is said to be the asking figure. It is thought that if the Michigan men realize the necessity of immediate operations they will at once begin the building of a railroad westward from Knappa.

THE GREAT LEARY LUMBER RAFT, which went adrift off Nantucket eboals in December last, or portions thereof, are still drifting about the Atlantic to the great annoyance and danger of shipping. Some of the logs have recently been seen near the Straits of Gibraltar. The residents of the Azores and Madeira islands report their shores lined with trunks of bge trees, which are, beyond doubt, part of the Leary raft. Captain Lawrence of the bark Platena, from Huelva, Spain, reports passing on September 4th, in latitude 35°, longitude 18°, great fields of logs adrift. This is the greatest distance to eastward where they have been seen, being directly on the coast of the Madeira islands. The ravages of the teredo worm and the water-soaked condition of the logs render them of no market value. The weight of barnacles, which has been forming on them for months, has caused the monster logs to disappear partially beneath the water, and they are more of a danger than before. The extent of water covered by these logs may be gathered from the report of Captain H. H. Staudt of the German bark Bremen, who states that he was five days among the logs, many of them striking the ship, tearing the copper and damaging the rudder. Samuel Dabney, United States Consul at Fayal, Azores, reports that on June 12th a spruce log, 40 feet long, drifted ashore. It was roughly sharpened at both ends and was identified as part of the raft.

A MORTGAGE of \$1,620,000 was filed in the Inyo County Recorder's Office, last week, by the Carson & Colorado Railroad Company. The prevailing opinion is that the money will be used to extend the road to Los Angeles, and that it will be ready for travel by July 4, 1889.

The Tahoe logging-camps have closed for the season.

SAW MILL NOTES.

Sawmill Refuse.

The safe disposal of sawmill refuse is literally a burning question, and one which in many places is really a serious one and involves the expenditure of large sums of money. After the saw dust and refuse has been burned under the boilers in steam-mills, and all that can be out up into lats thus disposed of, there

plates, and lined with brick. This is about 60 feet high, and then tapers in till it is about 14 feet diameter, and thus is continued another 50 feet, and is crowned with a spark-arrester. The refuse is carried up about 50 feet, and is there discharged by a suitably-shaped mouth-piece, so as to scatter the refuse over the bottom of the burner. This burner cost several thousands of dollars, and has been in use for several years with great success. The spark-arrester frame is made of wrought-iron piping, with the ends left open, so that air circulates through it and keeps it cool. This is covered

Fig. 2.—PLUMMET FOR RECORDING EARTHQUAKES.

SOUTH AND NORTH LINE OF CALIFORNIA STREET

Fig. 3.—EARTH MOVEMENTS RECORDED BY PLUMMET.

still remains a large amount of material which in one way or another must be got rid of. In earlier times the common way was by open barge maintained at a presumably safe distance from the mill, and to which the refuse had to be conveyed, often at considerable expense.

In more recent times furnaces have been specially designed, into which, by the action of machinery, the refuse is constantly discharged as fast as produced in the mill. For a large mill the furnace must be very large, and is very costly. In one case in Ontario the burner is over 30 feet in diameter and has a total height of 120 feet. The lower part has suitable openings for admission of air, and for entrance for repairs when necessary. It is really an iron casing, made of wrought-iron

with heavy wire netting, the meshes being about one-fourth inch square.

This kind of a burner is only well adapted for large mills, as it must be of considerable height to insure safety, and the height necessitates a large diameter. The two things necessary in a successful burner are: first, the prevention of the escape of burning pieces or sparks of sufficient size to cause a fire; and, secondly, some means by which the heat generated may be dissipated without injury to the furnace itself, so that it might last for a reasonable time.—*Geo. C. Robb.*

BAND SAWS FOR LUMBER.—The recent introduction of the hand-saw in the lumber-mills of this State and in the northern forests has

afforded much economy in production. Band-saws were first used on a small scale for scroll-work, and it was believed at the outset that the principle could never be applied on a large scale. This, however, has been proved to be a false opinion. A hand-saw in use in a Tacoma mill saws heavy lumber for turntables and other purposes, and it matters not whether it be soft pine or the hardest seasoned fir, the few runs through the wood like a sharp knife through cheese. Nevertheless many of the old sawmill men now using circular saws that waste thousands of feet of log lumber annually are very slow to adopt the new device. It is said that there is no more conservative class of men to be found than the proprietors of the large sawmills in the Puget sound region. They have the idea that nothing that is not now in use by them can be successful, and are, to a great extent, opposed to newfangled notions. None of these men will put in a hand-saw unless it is at the expense of the manufacturers, being unwilling to make any experiments.

Evolution of the Saw.

Every instrument which the mechanic uses has a history. Some of them were brought into being by inventive genius, and required days and nights of wearying thought to complete the conception and to overcome imperfections. The simpler tools have been in use for centuries under one form or another—at first only rude suggestions of what they afterward came to be. Perhaps no tool has a more interesting history than a saw. According to a recent writer, saws have been discovered in Germany and Denmark which belonged to the bronze age. The metal of which they were composed was cast into a thin shaft and serrated by breaking the edge. Equally interesting discoveries have been made in this country.

It has been found that saws made of obsidian, which is a kind of glass produced by volcanoes, were used during the stone age in Mexico, and saws and knives of the same material have been found in the alluvial deposits of New Jersey, thought to have been sent thither from Mexico by the action of the water. The Phœnicians are among the earliest nations which are thought to have used the saw.

The scholar is not surprised to find a very pretty story accounting for the discovery of the saw in Grecian mythology. Here the inventor is said to have found the jawbone of a snake which he limited by joggling an iron plate. One day the nule of the inventor murdered him in a fit of jealousy, so the story goes, and if the thirty may be taken of filling out this little romance, by plunging one of the poor young man's own saws through his heart.

The Lacustrine and other early inhabitants of Europe are credited with having saws made of flint, and the native of the West India islands had saws made of notched shells. The Japanese saw is a curiosity. It is shaped something like a butcher's cleaver. The shank is drawn into the handle, which is flat, where it is secured by being wrapped with split cane. The teeth are described as being very narrow and pointed toward the handle. Some of the saws used by the ancient Egyptians are exceedingly rude and imperfect, consisting of long, thin blades, regged at the edges, and driven into rough pieces of wood. It is from such crude and inefficient implements as these that the modern saw has been developed. The law of evolution has been operative here, as the philosopher might say, as it has been elsewhere.

Records of Earthquakes.

Systematic efforts are now being made to record the earthquakes which occur in this State. Seismographs for recording the shocks are now in use in California at the following places: Two at the Lick Observatory, Mt. Hamilton (one of them very elaborate); one at the Cbatot Observatory, Oakland; two at the State University, Berkeley; one at Mr. Blinn's Observatory, Highland Park, East Oakland; one at Sntro Hights, and one at Mr. Jarboe's residence, Pine street, San Francisco. The instruments are self-recording, and the diagrams made are forwarded to Prof. Holden at the Lick Observatory.

We reproduce on this page diagrams of some recent earth movements as recorded by these instruments. No. 1 shows the movement recorded September 17th at 3:49 A. M. at the Cbatot Observatory. The point of beginning was at the north, as indicated by the small arrow, and the ending at the south, as indicated by the other small arrow. No. 2 was made October 5th at 4h. 41m. 30s. A. M. In this also the commencement was at the north end, and the completion of the shock at the point indicated by the lower arrow. This shows quite a movement, but the shock was noticed by very few people.

No. 3 is a record of an earthquake which occurred last week, October 24th, at 2h. 50m. A. M., and the diagram is from the Cbatot Observatory instrument. The point of beginning was as indicated by the upper arrow and

its ending at the point indicated by the lower arrow. The large arrow at the side of the diagram points north, so that the direction of all the movements may be understood. This last earthquake was noticed by a number of people, and the time was given to Mr. Bunkhalter, of the Chabot Observatory, by several observers. Mrs. Fox placed it at 2:50 A. M.; Mr. Wm. Ireland at 2:50:30, and Mr. Watson at 2:50.

No. 4 of the diagram shows the same earthquake as recorded on Mr. Blinn's instrument at Highland Park, East Oakland, about two miles from the Chabot Observatory. The time as given to him by Mr. Ireland was 2:50:30 A. M. This shock was evidently local, and the records of the two instruments show a very different movement. In Mr. Blinn's instrument, the movement is shown to have commenced at the south, and ended at the point indicated by the upper arrow.

We have already described and illustrated the seismograph in the PRESS. The instruments are made in this city by the California Electrical Works and are quite inexpensive. No skill is employed to use them. A plate of smoked glass is placed under the pointer which makes the record of the movement on that, and "blue-print paper" is used to obtain copies. The Lick Observatory will send a man to adjust the instrument so that all will be set to the same degree of sensitiveness in order that similar shocks will show similar results.

These movements which we have referred to were all small, and very few people could notice them. The diagrams are all about four times larger than the actual movement of the earth.

Mr. J. M. Kelley of No. 122 California street, in this city, has for some time made observations on earthquakes, using a very simple means for the purpose. The method is shown in Fig. 2. It is simply a suspended plummet beneath which is a smooth surface covered with fine sand. The point of the plummet moves the sand from beneath it when there is a movement of the earth, leaving marks which indicate the direction and extent of the shock.

Fig. 3 shows some of the records made by means of this appliance, last year, before the seismographs now in use were in place. Within a few months several movements were recorded. The recording instrument is in the second story of the building, which is on "made ground," on California below Front. The passage of heavily loaded wagons does not make any record on the appliance, notwithstanding the character of the ground in that vicinity. Of course this cannot give such accurate results as the seismograph, but the results are shown as a matter of interest in this connection.

ALASKA FISH.—The U. S. Fish Commission steamer Alaska has returned from an expedition to Alaska. The waters of Alaska were found to be teeming with fish of all kinds—cod, halibut, tomcod, black cod and pollock being particularly plentiful. One peculiarity was noticed, however, regarding the Alaskan banks, that is, that the water is comparatively shoal and the banks themselves long and narrow and seldom out of sight of land. Here the banks run parallel with the Aleutian group of islands and are about 100 fathoms below the surface. On the outer edge of the banks there is a very steep slope, the depth of water increasing suddenly to 600 fathoms or more. The cod here are the same as on the Newfoundland banks, but smaller in size, and the supply is practically inexhaustible. Up into the Behring sea the same state of affairs exists, and this latter place is the favorite fishing-ground of the San Francisco fleet, because the weather is better and there is less fog. For this reason the fishing vessels prefer to go a hundred or so miles more. Along with the codfish were found black cod and halibut, and also some red rockfish. The halibut of the far northern waters is small, and will be of no use for years to come, or until the larger fish farther to the south are exhausted.

STATE MINERALOGIST'S REPORT.—The annual report of the State Mineralogist has been completed and that official has taken the manuscript to Sacramento ready for the printer. The report this year will deal mainly with the gold mines of the State. Information has been obtained from all the counties by special assistants employed for the purpose by the State Mining Bureau.

THE COMMERCE OF PUGET SOUND, for the year 1888, will show a much larger total than in any previous year. Certain railroad facilities, which have lately become available, promise to make Tacoma an important shipping point for a large quantity of Oregon wheat. The advantage of loading there, as against Portland, has made the change, and it promises to be permanent and of growing importance.

Coast Industrial Notes.

THE output of the Oregon Iron and Steel Co.'s furnaces is now about 60 tons per day.

NEVADA COUNTY now produces a great deal of fruit, and a cannery is much needed.

SAN FRANCISCO has three trunk factories, employing 150 men. The annual product is valued at \$800,000.

THE Lewis & Clarke Lumber and Manufacturing Company of Astoria has made an assignment.

THE TANNERY of Faithful & Ryan on Twenty-sixth street, San Francisco, was burned on Sunday.

GLOVE FACTORIES IN THIS CITY.—Our County Assessor reports 14 glove factories in the city, employing 200 persons and turning out a product valued at \$250,000 per annum.

SAN FRANCISCO TANNERIES.—The annual product of the San Francisco tanneries is now \$1,100,000. There are 20 of them in the city. To tan 200,000 hides they use 4000 cords of bark and employ 250 men.

THE BUREAU OF CONSTRUCTION and repairs has completed the specifications for the necessary tools, etc., to equip Mare Island Navy-Yard, in accordance with the appropriation of \$100,000 made for that purpose in the Navy Appropriation bill.

NATURAL WOOL CLEANSING WATER.—The Virginia Chronicle says: It has been discovered that the water of Mono lake makes an excellent wool-cleanser, and during the past week one of the largest wool-buyers of San Francisco has been up looking after the same.

THE COAL MINERS' STRIKE at Newcastle, N. S. W., still continues, and consequently there is no immediate chance of a fall in the price of coal here. The steamship companies at Adelaide are burning wood instead of coal for an experiment, and thus far with satisfactory results.

THE California & Mexico Steamship Company has been absorbed by the Oregon Improvement Company, thus giving the Guaymas trade to the Pacific Steamship Company. The price paid has not been made public, but it is understood to be something like \$200,000 for the steamers Mexico and Newbern.

HARNESS-MAKING IN SAN FRANCISCO.—The directory reports 57 firms in the harness trade in this city. The County Assessor reports 34 firms engaged more or less strictly in the manufacture of harness and saddlery, employing 375 men and turning out a product of \$1,200,000 annually. Main & Winchester, harness makers, employ 225 men.

THE STANFORD UNIVERSITY.—About 250 men are at present at work on the Leland Stanford Jr. University, and the buildings are fast assuming shape. The buildings will be roofed with tiles, which are manufactured in Ohio. About 255,000 pieces have already been received, and several carloads are en route. Work will shortly be commenced on the school buildings.

THE BIG HOTEL AT SAN JOSE—the Vendome—has been completed and is now ready for its furniture. The building is a stately edifice with a frontage of 300 feet and a broad wing extending from the back some 200 feet. It is four stories high, built in the substantial style of modern architecture, with broad porches similar to the famous Del Monte at Monterey.

SHUTTING DOWN FURNACES.—The Eureka Con. and Richmond Companies at Eureka, Nev., have both concluded to close down their furnaces on account of the threatened Government timber suits. They are at present purchasing no ore except what has been contracted for. This is not the way in which the National Government should treat our industries.

AMONG the cargo of the steamer Al Ki which sailed on Saturday for Vancouver, were in transit for Boston 30,950 pounds beans and 72,816 pounds wool, value \$14,100; for Concord 21,134 pounds wool, value \$8450; for Great Falls 60 boxes raisins, value \$100; and for New York 587 cases canned fruit, value \$2350.

THE International Brotherhood of Boiler-makers and Iron Shipbuilders have issued a notice to all manufacturers of steam boilers that after November 1, 1888, boiler-makers will not perform any labor on boiler heads that have been flanged in the East, or on partly constructed boilers that may have been sent here from any foreign country or the Eastern States. They want all work for the coast done on the coast.

CALIFORNIA LEATHER EXPORT.—In 20 years the leather-export trade of California has increased from less than \$100,000 to about \$700,000. Japan has always been the best foreign market for our tanners, but shipments are made to Australia, Asiatic Russia, China, France, British Columbia, Hawaiian islands and Mexico. We still import more or less leather, despite

the quantity and variety made in California. These imports, however, are mainly confined to the finer and more costly descriptions.

A HOTEL AT POINT LOBOS.—Adolph Sutro is about completing plans for the erection of a large hotel at Point Lobos, which promises to be a very popular resort, as the weather there is always pleasant. The Sutro Heights are close at hand, and this, with the attraction of the new hotel, Mr. Sutro believes, will bring a great deal of travel that way. The ground is already cleared for the building.

LARGE RESERVOIR AND DAM.—The Lassen Advocate says: "The Northern California Development Association has commenced work on what will be, when finished, the largest reservoir in Lassen county. The proposed dam is 2700 feet in length, and will, it is calculated, back water over 900 acres, five feet deep in the shallowest part. The water from the reservoir will be used to reclaim a tract of desert land of about 20 sections, or nearly 20,000 acres, which will, we are informed, be cut up into small farms and sold to settlers."

COIN FROM SYDNEY.—The steamer Alamsda, from Sydney, brought 62 boxes gold coin, amounting to \$294,911 12 41, equal in American money to \$1,274,555. This is the largest amount of specie imported this year. It is believed that this money has been sent here to buy grain bills on England, in preference to direct shipments of specie to that country. This has been the case with other similar consignments. The sovereigns go to the Mint on Fifth street, and when they leave that institution they will go forth as American eagles.

THE McCLLOUD RIVER SALMON-STATION in California, which has always held the world's record in taking salmon eggs, succeeded this year in taking only a million and a half eggs. But either the McCloud River Station or the Clackamas Station, being both wonderfully adapted by nature for taking salmon eggs, could easily secure 10,000,000 eggs a season, if the parent salmon had half a chance to get up the rivers. As it is, the salmon are so unmercifully netted and trapped on their way up to the stations that it seems almost a miracle that any of them get there alive.

THE SCHOONER ACME, now lying at La Rue's wharf, is an example of what perseverance can do. This little vessel was built by Captain Jorgensen, her captain and owner. She was built at Soli Slaw, quite a distance from the sea, and there is a photograph of her as she lay in the stocks, the hulkwood growing all around her. Captain Jorgensen was helped by the ranchers and others in his work, and has turned out a very substantial vessel. She is to be fitted with engines as a steam schooner. Her dimensions are: Length, 82 feet; beam, 22 feet; depth of hold, 7 feet.

FIFTEEN COTTAGES have been built at Emerald Bay, Lake Tahoe, by Dr. P. T. Kirby. A large hotel will be built next season. Next year he will have his place fitted up in great style. An elevator will take visitors to the top of a cliff 212 feet in height that stands back of his place. The elevator will be run by a Pelton water-wheel four inches in diameter under pressure of a vertical column of water 800 feet in height, and the same Pelton wheel will drive a dynamo by means of which all the cottages, the hotel, the cliff, and the bay will be lighted up of nights.

MILLS ON THE CARSON RIVER.—The Virginia Enterprise says: Although the mountain streams have received no great increase of volume from either rains or snows yet—through the decrease of evaporation—the flow of water in the Carson river is gradually increasing. The mills are beginning gradually to drop the stamps so long hung up. The mills along the Carson river at present in operation are the Mexican, partially, the Morgan on steam, the Vivian hy water, and the Eureka working 20 stamps out of 125. The Brunswick and Santiago are expected to start up Nov. 1st.

TAYLOR'S PAPER-MILL BURNED.—A dispatch from Taylorville, Marin Co., dated Oct. 28th, says: At 2 o'clock yesterday a fire broke out in the finishing-room of S. P. Taylor & Co.'s paper-mill, completely gutting it, destroying in the neighborhood of \$6000 worth of paper and damaging the building about \$4000 or \$5000. The fire pumps, which are always ready, and Schenck's patent reels and hose, saved over \$150,000 worth of property, with the help of the men, and especially of the neighbors. How the fire originated is not known, but it was probably from an exploding lamp. The loss is fully covered by insurance.

THE EL DORADO SLATE CO. has recently incorporated and elected the following officers: President, H. C. Partridge; Vice-President, P. J. O'Connor; Treasurer, Bank of California; Secretary, W. Aug. Knapp; Directors, C. A. Warren, Chas. T. Bohen, W. Aug. Knapp, H. C. Partridge, P. J. O'Connor. The lands of the Co. consist of 180 acres, situated on either side of Big canyon, which is the longitudinal gorge running north and south and parallel with the cleavage of the slate, which will give great advantages, in point of economy, in quarrying. The Co. intend opening a quarry on the east side of the canyon, near the mouth of the Big Tunnel, and instead of running end-

wies on the slate, they will make their opening parallel with the cleavage. This quarry will be about one and a half miles from the railroad depot at Placerville. The hill on the east side of the canyon being very steep, it will not take long to get an immense face opened up at this point, where shops will be erected in such close proximity to the quarry that the expense of handling will be nominal, besides being near a stream which will furnish ample water-power for all purposes.

PROSPERITY OF UTAH.—Caleb B. West, Governor of Utah, in his annual report to the Secretary of the Interior, estimates the population of the Territory at 210,000, an increase of 66,000 since 1880. The manufacturing industries of the Territory are said to be in a satisfactory condition, and, taken as a whole, the Territory has been progressive and prosperous. Owing to an unusually light rainfall during the season, dry farming has not been a success, but irrigated land has produced abundantly. The aggregate of mineral products of the Territory for 1887 is given as \$7,637,000, of which \$5,975,000 was silver. Labor, the report says, has been in demand during the year. Nearly all trades are well paid and fully employed.

THE CITY FRONT TRAFFIC.—A. N. Towne of the Southern Pacific Co. in a letter to the Harbor Commissioners says: I did not understand from you, during our conference, that you had fully matured plans for laying rail tracks north of Market street; but with the great natural increase of freight traffic in this city it will not be a great while before a double-track freight road around the city front will be necessary. In view of this and the safe management of the enormous passenger business centering at the foot of Market street, which during the year 1887, by our ferryboats alone, amounted to, in round numbers, 9,717,000 persons, a plan for a depressed road along this section of the waterfront would seem to be necessary.

GROWTH OF ARIZONA.—O. M. Zolick, Governor of Arizona, in his annual report to the Secretary of the Interior, states there has been, during the year, a steady progress in the growth and development of the Territory. The population has largely increased. Indian depredations are a thing of the past; life and property are now safe and law and order are supreme. During the year 295,841 acres of public land were entered by settlers, 200 miles of canal for irrigation were made and 100 miles additional will be built during the present year. The importance of Congress authorizing a hydrographic survey of the Territory to demonstrate the feasibility of artesian wells and water-storage reservoirs is dwelt upon at length. The yield of gold and silver last year was \$5,771,555.

THE OAKLAND GASLIGHT AND HEAT CO. is at present erecting a structure of some importance on First street, between Jefferson and Grove streets. The building, which is to be of brick, has a solid concrete foundation two feet in thickness, and carried down on the hardpan 11 feet below the grade. The lower walls will be constructed of piers 4x8 feet and 26 inch arches will span the spaces between them. The building occupies an area of 56x127 feet and will be two stories in height; the lower story 16 feet and the upper story 14 feet in the clear, and be surmounted by a four-foot fire-wall. Twenty-four dynamos will be placed on the second floor, and they will be driven by two engines of 500-horse power and one engine of 300 horse power. The smokestack of this building will be 16 feet in circumference at the base, and it will rear 90 feet aloft.

SALMON IN ALASKA.—The U. S. Fish Commission steamer Albatross reports salmon to exist in almost inexhaustible quantities in Alaska, at one place the weight of the haul breaking the seine. The fish, as a rule, are smaller than those of the Columbia river, but one species, known as the king salmon, attain a weight of from 80 to 140 pounds. The salmon-canning industry in Alaska, it is predicted, will grow to gigantic proportions in a few years, and will completely do away with the business on the Columbia. Not only are the fish more numerous, but they are more easily taken. Of late canners on the Columbia have paid as high as \$1.50 apiece for fish, while in Alaska five cents each is about the ruling price paid for them at the canneries, and more are offered than can be worked up. So plentiful, indeed, were they, that the sailors on the Albatross used them for bait while codfishing.

AN OVERFLOW DAM.—Work has been commenced on an overflow dam in "Paradise cut," which makes out from the San Joaquin river about 15 miles south of Stockton. The work is done under the supervision of Engineer Tucker, the Government engineer, Major Huer, having charge of the work. The dam will be 225 feet long and 40 feet wide, and the top will be eight feet above mean low-water mark. The materials will be timber with earth filling. Paradise cut carries an immense body of water, and for many years has been of serious injury to the navigation of the upper San Joaquin, and has interfered with the navigation of the river from the cut northward by diverting the current of water and allowing the stream to fill up. This is an important piece of work for Stockton and the county, and has been recommended for many years by local and Government engineers.

Native Lead.

(Written for the Press by HENRY G. HANKS.)

Many years ago the writer received a specimen of metallic lead said to be native, and to have been found in the Jersey mine, Battle Mountain, Nevada.

Knowing native lead to be an uncertain mineral, reference was made to the authorities; which led to the specimen being set aside as unworthy of a place in his mineral collection.

Quite recently a specimen was sent by Prof. Th. Hjortdahl of Christiania, Norway, which was labeled native lead, Paj berg, Sweden.

Coming from so high an authority, attention was again called to the subject, which, on further study and investigation was found to be so interesting to the writer that it was thought worthy of placing before the intelligent readers of the MINING AND SCIENTIFIC PRESS.

The Battle Mountain specimen was looked for and found where it had lain for so many years, in disgrace and dust, cleaned, a new label written, and both specimens subjected to microscopical, physical, and chemical examination. The Nevada specimen weighed 33.03 grammes, was thin, but of irregular thickness; one side was smooth, and showed evidences of having been attached to some comparatively even surface; the other side was rough, uneven, and not only showed several minerals, the result of decomposition of the metal, but was coated with a dark incrustation. It did not differ materially from pieces of lead taken from old buildings and baths in Ancient Rome and Pompeii. The superficial minerals seemed to be silica with cerussite, minium and litharge, but the point of a knife applied with gentle pressure at any part, gave a shining streak of metallic lead. A portion being cut from the mass and passed between rollers, produced a ribbon of malleable lead, which, when melted on charcoal, gave the characteristic coating. An assay proved the absence of silver, which is considered a remarkable fact.

The Swedish specimen weighed 6.38 grammes; was irregular; showed no smooth surface. With the same magnifying power, the inequalities of surface seemed more minute, but when more highly magnified it was found to be similar to the Nevada mineral, with the addition of certain bluish, brilliant crystals of a foreign mineral, the exact nature of which could not be determined optically. Otherwise, it gave the same reactions, but was found to contain 0.25 per cent of silver.

As far as known, native lead—or what was supposed to be such—was first obtained in Monmouthshire, in England, in the year 1772, although the mineral was mentioned by authors before that date. The specimen was dug up by Dr. Morris, while laying drains. It was found at no considerable depth, in small granules, which flattened under the pestle. The discovery was first announced in the Philosophical Transactions, vol. 63; 1772; folio 20. No mention is made of a mine; but the find was in an open field. From that time to the present, it has been a question if the substance was really native lead, and if lead does or can exist naturally in a metallic state. If the question can be answered in the affirmative, it must be one of the rarest of minerals.

The following seem to comprise all the localities where native lead has been found:

Alston Moor, Cumberland, England.—Allen (Thos. Allen, an English mineralogist), discovered metallic lead in a small vein, one inch thick, in limestone, but doubted its genuineness. It was found in small globular masses, imbedded in galena, and a suspicious, sluggy substance, and associated with minium, crystals of sphalerite and quartz and mealy anglesite. Nicol describes the matrix as a feed mass, resembling slag.

Anglaise River.—This locality is placed in Ohio by one writer, and in North America by another. Both are frequently referred to. The deposit containing the supposititious lead is described as traversing hexahedral lead glance in narrow veins.

Bohemia.—Only mentioned.

Bristol, England.—In carboniferous limestone. This locality is given by Nicol and Phillips.

Chili.—"Mr. Gleig of England has recently found in a mass of meteoric iron received from Terapaca, Chili, small globules of meteoric lead in a metallic state, with iron, magnesia and phosphorus combined. This is, we believe, the first instance in which metallic lead or any of its compounds have been found in meteoric masses."—*Annual of Scientific Discovery*, 1887, Vol. 332.

Carthagena, Spain.—This locality is frequently referred to. Davies says the mineral is found in clay slate. Nicol affirms that it was in deserted mines and is doubtful.

Kenmare, Ireland.—This locality is given by Nicol without remark. Dana describes it as being in thin sheets in rad oxide of lead near a basaltic dyke.

Languedoc, France.—Described by Gensanne, "History of Languedoc." Vol. 3, Fol. 208. Gives Vivaria as the locality, and describes considerable deposits of earthy lead in which native lead is found in globules from the size of a pea to a musket-ball and larger; but Hany, "Traite de Mineralogie," 1801, Vol. 3, Fol. 452, says the director of the mines of Villefort, son of the same mineralogist, visited the locality, which he studied with great interest, and certified that in his opinion the lead thought to

be native was the work of man, because he found litharge and other indications of art, and what was believed to be native lead was really artificial.

Madeira.—This locality was discovered by Rathke, a Danish savant. He presented specimens to Haüy, who came to the conclusion that they were natural. The metal was found in a soft lava in considerable quantity. Mobs says the formation is considered by some to be slag.

Mexico.—This locality is given by Pisani. It is more than likely this metal is the result of ancient reduction works, for reasons given elsewhere.

The Monmouthshire locality has been described elsewhere.

Salzach River, Austria.—Only mentioned as being found in auriferous sands.

Sweden.—Locality given by Pisani. The piece sent by Prof. Hjortdahl is from that country. The specimen has been described elsewhere.

Vesuvius.—That native lead has been found in the lavas of Vesuvius is only mentioned.

Many works, both ancient and modern, have been consulted in preparing this paper. Every author expresses doubts as to the existence of native lead, and some do not mention it. The following writers refer to this mineral, as quoted:

Pettus, Joba, "Fleta Minor," 1683, does not mention it.

Neuman, Casper, 1755, "Chemical Works of," "Lead is sometimes found in the earth native or in its metallic form, although rarely pure."

Henckel, J. F., "Flora Saturnisens," 1772, mentions it as having been found in a mine. He was a noted and able chemist and mineralogist, and was made Chancellor of Mines by Augustus II, King of Poland.

Cronstedt, A. F., "System of Mineralogy," 1758.—"I know of no native lead, and all that has been said on that subject is liable to remarkable restrictions."

Pryce, Wm., "Minerologia Cornubiensis," 1778.—"It is seldom found malleable or purely metallic, for what have been taken for specimens of native lead have produced very often three parts in four of fine silver, from which many have supposed that there is no such thing as native lead. I have, however, seen two specimens of it, in the possession of Mr. Bannalack in this county."

Kirwan, Richard, "Elements of Mineralogy," 1734, mentions the Monmouthshire locality and refers to Phil. Trans. 1772; also to Vivaria and Languedoc, France, as other localities.

Babbington, William, "New System of Mineralogy," 1779, says: "Lead is so seldom met with in its native state that by many mineralogists its existence has been called in question. But that it does now and then actually occur is proved by the specimen No. 11 from Brittany." He, too, refers to the Monmouthshire discovery.

Hany, Abbe Rene, "Traite de Mineralogie," 1801, refers to the specimen of metallic lead in the collection of Richter as being lighter and less malleable than pure lead, discredits its genuineness and thinks it is a slag from an ancient furnace, but concludes that the Madeira lead is natural.

Werner, A. G., "Treatise on the External Character of Minerals," 1805. Native lead is not mentioned.

Kidd, J., "Outlines of Mineralogy," 1809, alludes to the occurrence of native lead in the following words: "The existence of native lead has not yet been satisfactorily ascertained, and its ores are so easily reduced and have been so commonly worked in all ages that great caution would be requisite in examining local circumstances, in order to determine whether a specimen supposed to be native was really so or only a portion of the ore that had been smelted at some former period." He refers to the Madeira lavas with this qualification: "But the peculiarity of the situation may seem to explain their presence."

Kirwan, Richard, "Elements of Mineralogy, Third Edition," 1810. The existence of lead in this state is very generally denied, and from the easy calcination of this metal by air and moisture, it must be allowed to be somewhat doubtful, yet to deny it absolutely is in this, as in many other cases, rather rash, particularly as the specimen found in Monmouthshire has all the appearance of being in a perfect metallic state, and no solid proof, deserving attention, or even a well-grounded suspicion of its having been produced by art, has been adduced.

Delametherie, J. C., "Lecons de Mineralogie," 1812, refers to recent discoveries in volcanic materials, which he assumes are reduced by subterranean fires, and to Monmouthshire, and adds, "but these facts are not established."

Jameson, Robt., "System of Mineralogy," 1816. Native lead is not mentioned.

Cleveland, Parker, "Elementary Treatise on Mineralogy and Geology," 1816. "Several instances of the occurrence of native lead have been published, though in but few of them does the fact appear to be well established." Specially refers to the Madeira locality.

Thomson, Thomas, "A System of Chemistry," Book 3, Minerals, 1818. Native lead is not mentioned.

Blakewell, Robert, "Introduction to Mineralogy," 1819. "Lead has never been found native, unless we except the particles of metallic lead which, according to Brongniart, are said to be imbedded in lava in the island of Madeira." Mobs, Frederick, "Treatise on Mineralogy,"

1822. "Metallic lead as it occurs in nature is almost in every instance accompanied by such substances as betray its being once in a state of fusion." He refers to Madeira, Anglaise river, Carthagena, Spain, and Alston, Cumberland, England.

Beudant, F. S., "Traite Elementaire de Mineralogie," 1830, says: "Lead in a metallic state is known," etc. He then gives the usual localities, Vesuvius, Madeira, Alston, Bohemia, but does not express an opinion.

Thomson, Thomas, "Outlines of Mineralogy, Geology and Mineral Analysis," 1836. "It has been doubted by mineralogists whether lead occurs native in the mineral kingdom." He refers to the Monmouthshire locality and expresses doubt, and to the Madeira lavas—quoting Phillips—and finally to the Alston vein traversing limestone, without expressing a decided opinion.

Gmelin, L., "Hand-book of Chemistry," 1843, follows his statement that it is found in nature with an interrogation point.

Dufrenoy, A., "Traite de Mineralogie," 1847, refers to native lead and thinks its existence is doubtful, except the Alston Moor discovery, which he believes is genuine.

Nicol, James, "Manual of Mineralogy," 1849, mentions Madeira, Carthagena, Anglaise river, Alston Moor, Bristol and Kenmare. Expresses no opinion.

Phillips, William, "Elementary Introduction to Mineralogy," 1852. "Said to be found in lava in Madeira. In carboniferous limestone in Bristol, Kenmare, Ireland, and containing silver, in auriferous sands of Salzach."

Pisani, E., "Traite Elementaire de Mineralogie," 1875. "This rare mineral is found in small quantities in Mexico and Sweden."

Raimondi, A., "Mineraux du Prou," 1878. Mentions its occurrence with grains of galena at Santa Barbara Mountain, Huancavelica. Says the specimen he examined was composed of three distinct minerals—malleable grains of metallic lead, a yellowish white scoriaceous mineral, and galena. Being found at the summit of the mountain, in a very small mass, he thinks it improbable, if not impossible, that they are the ruins of ancient metallurgical operations.

Davies, D. C., "Metalliferous Minerals and Mining," 1881. Mentions the stereotyped localities, and "in metallic-iron in Chile."

Not only have the most noted writers on mineralogy doubted the existence of native lead, but mining experience in California has shown that metallic lead of undoubted artificial origin is often found under circumstances leading to the opinion that it was native.

The pioneer miners of California found

Small Discs and Globules of Lead

In their clearups. It was at first supposed to be native, but was soon discovered to be shot and pistol bullets, sent by the miners themselves after quail and jack-rabbits. The discs were the same missiles flattened against rocks intercepting their flight. The specific gravity of lead is such that it soon sinks in the earth, and finds its way to the sluices, where it contaminates the mercury and causes the miners untold annoyance. When the rich placers became impoverished, claims consolidated, and worked by the hydraulic process, enormous quantities of earth washed down through the sluices and the concentrations treated to a general clean-up, lead many pounds in weight was always found with the gold, from which it was necessary to separate it, with considerable and vexatious loss of time.

It is reasonable to suppose that the accounts which frequently appear in print to the effect that native lead has been discovered in auriferous sands are mistakes, arising from the same cause. May it not be that the globules of lead found in Monmouthshire and Madeira mentioned elsewhere were shot or bullets?

It is a well-known fact that the inhabitants of Mexico and Arizona had made considerable progress in metallurgy. We find lead furnaces in ruins, and piles of litharge and slag, where all other signs are obliterated. For this reason we do not consider litharge a natural mineral on this coast, although frequently found. In such slugs the presence of metallic lead is most likely; this may account for the Mexican locality referred to by Pisani. What is true of the ancient races of America is true of those of Europe, and it is probable that metallic lead artificially produced is frequently mistaken for native metal; that most, if not all, instances given by authors are doubtful, and that the existence of native lead has not been proven.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

WEED & KINGWELL of this city have melted up the three old bells which have been in the old Mission church at Santa Cruz for many years, and will make from the metal one 1500-pound bell. The original bells were made in 1809.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

STAMP GUIDE.—John A. Gowan, Butte City, M. T. No. 391,527. Dated Oct. 23, 1888.

This is a guide for the etamp stems of quartz batteries, with a clamp by which it is held and adjusted with reference to the etamp stem and guide rail. The guides are made of hardwood in two halves. They are usually secured together and to a guide rail by bolts with nuts, and the constant jar and shaking of the stem makes it difficult to keep them tight. Moreover, the bolts and nuts must be removed to take out the stamps for repairs. This new invention is designed to provide an easy, quick and reliable means for securing the two halves together, adjusting them for wear and attaching them to the guide rail so that they may be easily removed when desired. The two halves are made tapering from the center toward both top and bottom, and at each end is fitted a clamp which incloses the front and two sides. The clamps are leveled to correspond to the level of the guide. The clamps are connected in front by a hand-screw, so arranged that by a single turn the clamps will be drawn toward each other upon the inclined bushing, and will then draw the bushing together and hold it firmly in its place in the chair. To remove the clamp stem the screw is turned out of the clamp nuts and the bushing may be taken out. The device is quite simple and convenient.

WATER-WHEEL.—Wm. F. Englebright, Nevada City. No. 391,523. Dated Oct. 23, 1888.

This is an improvement on the class of "hurdyurdy" wheels. It consists in the novel construction of the buckets and their attachment upon the rim of the wheel so as to project alternately upon opposite sides of the rim, the stream of water being delivered into the inner side of one bucket and discharged from the outer side of the bucket by reactionary force and into the inner side of the next bucket so as to be discharged from the opposite side of the wheel as it escapes from this bucket. By this means the inventor is enabled to throw the whole volume of discharge from the nozzle in a solid stream into each bucket alternately, and as it is not split or broken by dividing the bucket, the whole power is brought upon the bottom of the bucket, and the whole reactionary force of the escaping water also acts upon it. By reason of the alternate arrangement of the buckets the water is discharged upon one side of the wheel and then upon the other, so that neither of the buckets interferes with the free discharge of water from the one behind it.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

CALIFORNIA HEALTH FOOD CO., Oct. 26. Capital stock, \$10,000. Directors—F. Marty, L. Martv, F. J. Murty, C. and M. Moses.

BUENA VISTA M. CO., Oct. 29. Capital stock \$1,000,000. Directors—W. F. Myer, W. K. Dietrich, George A. Bill, S. Don Pattee and H. L. Cox.

ALASKA CO-OPERATIVE PACKING CO. Capital stock \$5000. Directors—Geo. Chapet, Joseph Frezer, John Harris, W. J. C. Andley and F. J. O. ff.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.

HOOVER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

SQUARE FLAX PACKING.

Manufactured from strictly first class Flax and pure lubricants. Superior to all others for Water and Steam. Packs with less friction and makes a tighter joint than any other packing made. All imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all Hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

Gold Mining Properties Bought,
Sold and Developed.

Propositions from principals only entertained.
SAFE DEPOSIT BUILDING, ROOM No. 2.

The EXPLORERS' and ASSAYERS' COMPANION.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, \$3.00 post-paid. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulae as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

**THE RAND DRILL COMPANY,
23 Park Place, New York.**

We are now so situated with our new works as to offer to the miners of the Pacific Coast SMALL AIR-COMPRESSING PLANTS at such prices that almost any small mine can afford to put in power drills if they have none in use.
By our NEW AND PATENTED SYSTEMS (by which the duty or performance of drills is not reduced with use) it is no longer necessary PLANTS IN THIS COUNTRY, and has patterns for all sizes up to 40-inch diameter of cylinder.
In respect to capacity INSPECTION OF DRILLING, perhaps it is in order to say that in EVERY AUTHORITY TEST for speed yet initiated, the RAND DRILLS have, without exception, BEEN VICTORIOUS. This fact, coupled with another important one, that the drills use much LESS AIR and cause LESS REPAIRS, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.
Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

PULVERIZERS,

CONCENTRATORS.

Westinghouse "Standard" and "Junior" Engines, Rock Drills and Air Compressors. Saw and Planing Mill Machinery, Machine Tools, Governors, Injectors, Oil Cups, and Lubricators.

BELTING, OILS and GENERAL SUPPLIES.

We are prepared to give estimates for Hoisting Works and Pumping Plants, Stamp Mills, Smelters and Concentrators.

—THE—
JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

THE PELTON WATER WHEEL

**GIVES THE HIGHEST EFFICIENCY OF
ANY WHEEL IN THE WORLD.**

And is everywhere recognized as the standard for high-pressure service.

UPWARDS OF 600 IN USE.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the country. It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRICAL TRANSMISSION.

Power from these Wheels can be transmitted by electricity long distances with small loss, and made available for running Mills, Pumping and Hoisting Works, Trams, cars, Electric Lights, etc. Address

Mineral and Agricultural Lands.

In another column we publish a letter from the Register of the Sacramento Land Office commenting on some of the statements made recently in the PRESS on the above subject. The matter of expense of contests to which we referred did not mean expenses of fees, but expenses incident to traveling to and remaining at the land office. Mr. Hetzel's suggestion that miners apply for patents is a good one and should be followed, as we have frequently urged.

In the last paragraph of his letter our correspondent acknowledges that frauds occur in men taking up lands as agricultural and afterward disposing of them as mineral. We know of dozens of instances of such action. When the Register and Receiver have substantial reason to believe such fraud to exist, final proof is not accepted. But how are they to have this substantial reason? Unless some miner is interested he will not go to the trouble to go to Sacramento to furnish proof. This is just the point we make. The mineral lands are being taken up as agricultural to the detriment of the mining industry. Unless there is a conflict there is no one to oppose the agricultural claimant, and the land goes out of the mineral domain forever.

In the series of articles recently published in the PRESS, the methods adopted have been described. The result is, large amounts of mineral land have been taken up as agricultural, and mining claims on the land afterward sold. This is all wrong. If no one opposes the agricultural claim it goes through, and no one dares unless he is directly interested.

People take up agricultural land alongside of mines, in what is really mineral ground. Then they can and do wrong the miner in one way or another. A case in point is that of J. H. Drummond, who has asked the U. S. Circuit Court for perpetual injunction restraining the Ilex Gold Mining Co. of London from operating the Tiger and Anglo-Saxon mines in Calaveras county. The complainant alleges that he owns valuable fruit lands on three sides of these mines, and that in working them the defendant has built ditches and roads through his land, and thrown great quantities of water and debris upon it, unfitting it for tillage. He prays that the defendant be forever restrained from repeating said acts or asserting any right to do so. It seems that the land, according to a local paper, would not bring Government price for other than mining purposes, yet a quartz mine is enjoined from working. It would be interesting to know how this mining ground was acquired as agricultural.

In another column is given a decision on a case just tried before U. S. Circuit Court Judge

Sawyer. The chief point of issue was whether or not miners may follow mineral vein outside of their own boundaries into land supposed to be agricultural. Judge Sawyer decides in the negative.

If people are to continue going into the mineral-land regions and taking up such land as agricultural, they are not only restricting the area for prospecting, but are hedging in actual working mines with such difficulties as are ap-

Fig. 1.—IMPROVED IRON STILL.

Iron Still for Sulphuric Acid.

In Mr. Adams' paper, from which we have been quoting in the last few numbers of the PRESS, he considers the advisability of combining the work of the two metals, namely, the addition of one or two iron stills of late type to the existing platinum plants. In this connection, he says he is aware that no successes, on a large and practical scale, are yet publicly

Fig. 2.—IMPROVED IRON STILL FOR THE CONCENTRATION OF SULPHURIC ACID.

parent from facts stated in the two preceding paragraphs.

It is manifest that our mineral domain is being gradually narrowed by means not contemplated when the laws were framed.

A DISPATCH from Panama states that about 250 gold and silver mines have been registered lately in the department of Antigua.

LOUIS CHAIZE, a well-known pioneer foundryman, died at San Jose on Monday. He was proprietor of the San Jose Brass Foundry.

credited to the iron-still plants, yet it is nevertheless true that iron stills which cost less than \$100 each are placed alongside platinum-heat pans; are doing the final concentration of areas of greater density than 65° B. without appreciable attack from arsenates, nitrates, etc.; are being driven at any required pace without material deterioration; are handled as easily as platinum in every way; are working at less cost in proportion, and have been thus working for several years. The greatest objection so far brought against the use of iron for this purpose

has been the exceedingly short life of the metal in service.

New as the ideas are, the drawings herewith will have due weight among practical men as details of setting, removal in case of breakage, etc., will be understood easily, the elaboration of the details being more for the study of those who have had an experience with glass alone. Fig. 1 shows a modified and perfected form of iron still, two of which type are connected direct to pans; and taking such pan acid at 63° B. are turning out 12,000 pounds of 98 per cent oil of vitriol each day.

Fig. 2 is entirely different and shows a perfected form of iron still, a modification of which is running at New York and connected to platinum, is turning out nearly 30,000 pounds of 98 per cent oil of vitriol daily.

Annual Assessment Work.

Miners and prospectors who have not already done so, should at once commence the assessment work on their claims to comply with the U. S. mining laws. Only a few weeks more remain in which to do the work. It is foolish to put off this necessary duty until the last minute and perhaps jeopardize important interests.

If work on the claims is not commenced on or before Jan. 1, 1889, they are liable to forfeiture and relocation. The weather about that time may be such in the mountainous regions as to entail a great deal of extra trouble and expense. It is a bad plan to delay such work until the last moment. The working of the annual expenditure feature of our mining laws is now so well known as to require no further explanation. If the work is not done each year, the claim is subject to relocation. When owners let location rights lapse and then take the chances in relocating themselves, they are apt to find some one else on the ground if it is at all promising.

The mining laws are liberal enough and should be strictly complied with. The idea of men holding ground from year to year without working it is a bad one, and the laws are intended to prevent this. They prevent, also, one man holding a dozen or so claims unless he does some work on them all. The amount of work is plainly specified, and there is no excuse for neglecting it. Men with any enterprise or forethought will do it now and not put it off until the last moment.

AN explosion in the Kettle Creek mine, Penn., on Sunday, killed 17 miners, mainly Hungarians and Italians. The direct cause of the explosion was the inexperienced use of dynamite.

The hoisting works of the Stormy King mine at Silver Reef, Utah, were burned one night last week.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Mineral Lands in California.

Suggestions From the Register of the Land Office.

United States Land Office,
Sacramento, Cal., Oct. 20, 1888.

EDITORS PRESS:—I notice in one of the country papers what purports to be a copy of No. 2 of a series of articles published in your journal, bearing upon the difficulties which attend the obtaining of title to mineral lands. I very seldom see the PRESS, and I have not seen the number containing this article, but the copy is in logical sequence and therefore presumably a correct one.

It may be of service to the bona-fide miner if I call attention to one or two of the points touched upon in your article; and first, as to the burden of proof in contests between agricultural and mineral claimants: The rule is, that the return of the United States Surveyor-General establishes prima facie the character of the land and the onus rests upon the party attacking that return. I have noticed that as a whole the returns of the Surveyor-General may be considered as favorable to the miner, that is, that where doubt exists he has returned the land as mineral. It is true that a homestead claimant can file upon a quarter section returned as mineral and thereby establish a reservation of the land which miners must successfully attack before they can file application for patent. I have always thought that it would be in furtherance of justice to hold the private agricultural applicant to the same rule as obtains in the case of the State under its School Land Grant, and to the C. P. R. Co. under the Act of July 1, 1862. This rule requires alike the State and the R. R. Co. to institute proceedings in the local office, to give full notice and disprove the mineral return of the Surveyor-General before their application will be considered. The rule, however, has not been extended to private agricultural applicants. The remedy for the wrong, if it be a wrong, rests, in my opinion, with Congress, and after consideration your journal in the interest of mining may consider it advisable to agitate the matter.

Apart, however, from the question of the onus based upon the Surveyor-General's returns, it is a well-established rule that the local Land Office in addition to its duties as a court deciding between adverse claimants, must act as the conservator of the interests of the United States, and in that capacity seek to prevent fraudulent agricultural entries upon lands properly to be considered as mineral. Within the last two years, during my incumbency, cases have arisen where the local office has taken this course.

In your reason No. 3 you have fallen into an error in stating that only a "dividend-paying claim" is of mineral value. You state that you understand that such has been the ruling of the Sacramento office. I am not aware of any such ruling, either of this office or of the General Land Office. The case to which you probably refer is that of the C. P. R. Co. vs. Valentine, wherein the Register and Receiver failed to agree, and their dissenting opinions were published in the *Examiner* some weeks since. In that case the opinion of the Register in favor of the agricultural applicant, as far as this point is concerned, was based upon his finding of fact that prospecting work had been extensively prosecuted, had proved unsuccessful, and had been abandoned. Without prejudging a case that may hereafter arise, it may be proper to state that I know of no rule or precedent which should prevent a local office from holding land to be mineral in character when the evidence shows that prospecting is being properly conducted in good faith and with a fair showing of ultimately successfully developing valuable mineral property. It stands to reason that unless the probability of future dividend be established the land must be classed as agricultural. The miners certainly will not continue to conduct operations in the view of a certain annual loss, and each land, if possessing a positive agricultural value, should not, upon an ill-founded hope, be withdrawn from settlement.

In the matter of the expense of contests, I desire to call your attention to the fact that, unlike the civil courts, there are no fees in this office. The expense incident to contests is simply the payment of the stenographer for taking testimony and reducing the same to writing. This is fixed by rule at 22½ cents per folio, and each party pays for the direct testimony of his own witness and the cross-examination of the witness of his opponent.

You allude incidentally to the "annoyance and loss of time from the precautions exercised by the local land offices and afterward at Washington." There is hardly a week in which I am not advised by the General Land Office of certain defects in preliminary or final proof in mineral applications which the applicant is called upon to remedy. These are all old cases, and I have felt that I was acting in the interest of the miner as well as performing my official duty in scrutinizing the evidence submitted with the same care that obtains in Washington. It is certainly better for the applicant that he should be subjected to present annoyance rather than that about three years hence he should be notified of the necessity of supplying various clerical or inadvertent omissions in his

proof and thereby cause a delay of two or three years more in the issuance of his patent.

In this whole matter of self-protection to the miner, permit me to suggest to you, as I have frequently suggested to individuals, that the miner's interests will be best protected by taking advantage of the generous provisions of the Act of May 10, 1872, and filing in the local office, as soon as he has performed his \$500 in labor, an application for patent. Such application is entered upon our tract-book, and, in itself, constitutes a reservation, prohibiting an agricultural claim, and maintaining the miner in his possession as long as he performs the annual labor required by law. My observation teaches me that too many of our miners neglect this important matter.

You also allude to the fraud practiced by agricultural claimants in obtaining title to mineral lands and thereafter disposing of them as mineral. I regret to say that I have reason to believe that such frauds have been practiced. It is, however, among the duties of the local Land Office to prevent such fraud if possible, and whenever the Register and Receiver have substantial reason to believe such fraud to exist, final proof will not be accepted. If such fraud even after final receipt be shown to exist, and patent has not already issued, the local office will recommend the Commissioner to order a hearing with a view to the cancellation of the entry. I have made several such recommendations, and have never known a case where the Commissioner has failed to comply therewith. If the miner has slept upon his rights, and if patent has issued, the Land Office has lost jurisdiction, and the remedy then rests with the United States Circuit Courts in an action brought by the relator with the approval of the United States Attorney-General.

Very respectfully yours,
SELDEN HETZEL, Register.

First Discovery of the Comstock.

The following letter to the *Illustrated Pacific States* will be of interest to the readers of the PRESS:

Being a subscriber to your journal, I would respectfully ask space in the same to correct an error that appears in your issue of September 1st, relating to the discovery of the Comstock lode at Virginia City, Nev.

Notwithstanding the account given by your correspondent is based on the Surveyor-General's report, it is not true that James Finney was the original discoverer and locator of the first claim on the lode. The first actual discovery of available quartz was made by Finney and myself, I furnishing the means to do the prospecting. The location was made on the 6th day of January, 1858. James Finney afterward claimed to have located the quartz claim, mentioned in the Surveyor-General's report nearly a year before, but, as was afterward proven, of no commercial value.

The claim in which I was interested was known as the Discovery claim. Having to leave about this time for Placerville to obtain supplies, and there being no means of placing the claim on record before my departure, advantage was taken of my absence and the property recorded in Finney's name. Finding on my return the heartless fraud that had been perpetrated upon me, I several times sought redress from the courts, but having little or no means at command, I found myself helpless before the moneyed combination that had been formed against me.

Some years ago State Senator Wellington Stewart introduced a bill in the State Legislature to compensate me for my losses sustained in the discovery, but the same combination that conspired to rob me in the first place had the influence with members to defeat the measure.

Reno, Nev.

ALVA GOULD.

WHAT IS QUICKSAND?—Quicksand differs from ordinary sand in being largely made up of very small particles of mica largely mixed with water. The mica is so smooth that the fragments slip upon each other with the greatest facility, so that any heavy body which displaces them will sink and continue to sink until a solid bottom is reached. When particles of sand are ragged and angular, any weight pressing on them will crowd them together until they are compacted into a solid mass. A sand composed of mica or soapstone, when sufficiently mixed with water, seems incapable of such consolidation. It is often a very difficult matter to build a road or any artificial construction on quicksand. To remedy this trouble, a Western railroad is putting steel ribs and plates into the excavation for a distance of 140 feet, the former 15 inches wide and the latter 24 inches, in order to secure a permanent foundation for the roadbed.

A HIGH BRIDGE.—The Keystone bridge to be erected at St. Paul, Minn., it is said, will be one of the highest in the world. It will extend from the end of the bridge spanning the Mississippi river at St. Paul, across a flat to the top of a high bluff. There will be about 20 spans, four of which will be 250 feet each in length, the remainder from 170 to 90 feet. The ends of the spans will be supported on trestle hents, some of them being 150 feet in height. The bridge is to be of iron and steel, and the work will be especially heavy, as some of the pieces weigh many tons.

Cholera Vaccination.

[Translated for the PRESS from the *Indépendance Belge* by M. N. M.]

The following on the subject of vaccination against Asiatic cholera was communicated by M. Pasteur to the Academy of Sciences of Paris. In the note epitomizing his experiments and conclusions, M. Gamaleia of Odessa, says: "This work is a simple and faithful application of an experimental method created in the laboratory of M. Pasteur, and which has already given such good results in chicken cholera, rouget, anthrax and hydrophobia. I need only mention the fact that the death of Thullier, five years ago, prevented the application of this method to Asiatic cholera. That event forced M. Pasteur to leave this disease to the investigations of his future scholars. Now, as I have said, I have only applied to cholera the two great principles of progressive virulence and chemical vaccine matter. It is known that the ordinary cultivations of choleric vibrios have such an extremely small virulence that M. Koch, who discovered them, believed, after a number of failures, that Asiatic cholera could not be communicated to animals by inoculation. The scholars of M. Pasteur, in the French expedition to Egypt, succeeded but in a single case in conveying the cholera, and to hut one chicken.

"It is easy enough, however, to induce the choleric vibriion with a virulence extreme; to do so, it is only necessary to put it into a pigeon after a passage through the cobrae (pigeon of passage); it then kills the pigeon by imparting a dry cholera, with exfoliation of the epithelium of the intestine. What is yet more important, the microbe appears also in the blood of the pigeon which have succumbed. After some passages this microbe acquires such a virulence that the blood of the pigeons of passage, in a dose of one or two drops, kills all the fresh pigeons in from 8 to 12 hours. This virus kills likewise the cobraes with doses still smaller. It is important to note that all the animals of these two species—without exception—succumb to the virulent infection. With this absolutely mortal virus we have been able to establish the existence of *immunité cholérique*. Thus, we have inoculated a pigeon twice with an ordinary cholera culture (non-virulent); the first time in the pectoral muscles; the second in the abdominal cavity. This pigeon became refractory to reiterated infection by the most virulent virus (the blood of the pigeon of passage). The fact of immunity has in this way been determined. Now, if we cultivate this virus of passage in a nutritive bouillon and afterward heat this culture to 120° for 20 minutes, in order to surely kill all the microbes that it contains, we then ascertain that the heating has left a very active substance subsisting in the sterilized culture. This culture, in fact, contains a toxic substance, which determines some characteristic phenomena among the animals experimented with.

Inoculated with a dose of four cubic centimeters to a cobrae, the sterilized bouillon produces a progressive lessening of the temperature and death in 20 or 24 hours. At the autopsy we find a pronounced *hyperhémie* of the stomach and intestines, and, as in reason, a complete absence of cholera microbes. The pigeons succumb also with the same morbid phenomena. They are, however, more resistant to this poison, as a dose of 12 cubic centimeters injected at one time is necessary to cause death. If, on the contrary, we introduce that same quantity of 12 cubic centimeters, but at different times, say in three, four, or five days, by injecting, for example, eight cubic centimeters the first day and four cubic centimeters the third day, we do not kill them.

Upon these pigeons, moreover, we verify a phenomenon of the greatest importance; they have become *refractaires au cholera*. The most virulent virus (the blood of a pigeon of passage) inoculated in a quantity of even one-half of a cubic centimeter cannot kill them. The vaccination of the cobraes succeeds even more easily; by putting in them the poison and vaccinal bouillon in doses of two cubic centimeters we vaccinate them in two or three sances, say in all, four or six cubic centimeters. Therefore, we are in possession of a method of vaccination which is preventive of cholera.

This method is founded upon the employment of sterile vaccine-matter, and possesses all the advantages of chemical vaccination; *la sûreté et la sécurité*, since chemical vaccine-matter can be measured in a manner perfectly strict, and introduced in doses small enough to be entirely inoffensive, while the venom of these gives the desired quantity necessary for complete immunity. In this way, then, in our experiments, immunity is conferred *sans danger et sans exception*. We hope, consequently, that this method will be applied to the vaccination of human beings to preserve them from Asiatic cholera.

In a private letter, added to the preceding note, M. Gamaleia wrote the following to M. Pasteur: "I authorize you to make known that I am ready to repeat all my experiments in your laboratory at Paris, in presence of a commission of the Academy of Sciences. I also offer to find out upon myself the inoffensive and sufficient dose for the vaccination of human beings, and, moreover, to make a trip into the countries ravaged by the cholera, in order to prove the efficacy of the method. If you should judge other details necessary, I will report them to you in a complementary note to this,

in which I will give you information of the immunity, of the mode of infection, etc."

The note and letter having been read, M. Pasteur said: "I have the honor to state, Mr. President of the Academy, that I desire to send the note of M. Gamaleia to the committee of the Brest prizes upon cholera.

"As to that which concerns me, it is unnecessary to say that I cheerfully accept the proposition that the experiments of M. Gamaleia be made in my laboratory, according to his expressed desire. M. Gamaleia has already labored several times among us, particularly in 1886, when he was sent to Paris by the municipality of Odessa, at the request of the learned Society of Russian Physicians of that city, in order to study the practice of preventive inoculation of hydrophobia, a method which he to-day informs us has been extended and applied so remarkably to vaccination which prevents Asiatic cholera. But, as he says with all the modesty of a great inventor, he has united to the methods of my laboratory the inspiration of the pages published by me upon chemical vaccination for hydrophobia, in the first number of the *Annales* of M. Daclaux, and the beautiful and decisive experiments of M. Roux upon chemical vaccine matter for *septicémie*, in the number of December last of said *Annales*. Since the labors that I recall, discoveries increase and accumulate in that which concerns chemical vaccine matter. We should not doubt that we will soon possess many others; the knowledge of that of hydrophobia, for example, will soon be known and utilized. Here is one of the last experiments I have made with the assistance of M. Eugene Viala, one of our young helpers in the laboratory, who has acquired extraordinary skill in the art of trephining.

"On the 16th of November, 1887, 15 centimeters of the marrow of a rabbit of 171 passage, which died rabid, was diluted in 30 cubic centimeters of sterile bouillon, after we had kept the cylinder of marrow for 48 hours at a temperature of 35°. Two dogs trephined and inoculated with this diluted marrow have not taken hydrophobia, which constitutes the greatest probability, if not certainty, that the marrow, by the heating, in contact with pure and dry air, had lost all its virulence. Nevertheless, the two dogs treated had been rendered refractory to hydrophobia, since, being inoculated by trephining on the 23d of May, 1888, with the *bulbaire* marrow of a dog that died of furious hydrophobia, these two dogs have resisted, and are still in good health. The heated marrow rendered non-virulent was then vaccinable, by chemical vaccine matter. L. PASTEUR."

Sutro's New Water-Power.

The following paper was read at a recent meeting of the California Academy of Sciences by Theodore H. Hittell:

Recent visitors to the Cliff House, in casting their eyes down to Adolph Sutro's unfinished marine aquarium, may have observed a very large stream of water running out of it. This stream has a fall of several feet and is powerful enough to run a mill. But though thus observed, it may not have occurred to the observers to inquire where that water comes from or to ask themselves why the level of the salt water in the aquarium is several feet higher than the high-water mark in the adjoining ocean. The answers to these questions are, however, exceedingly interesting and exhibit a new and most ingenious adaptation or application of water-power well worthy the attention not only of scientists, but of practical men.

The explanation of where the aquarium water comes from, and why its level is higher than that of high tide in the ocean, is very simple. Those who have carefully observed the aquarium have noticed that it is on the lee side, so to speak, of a jutting rock, and that through this rock, and leading out to its exposed face, is a short tunnel, through which the water flows into the aquarium. At the outer end of this tunnel, and on the face of the rock most exposed to the rollers of the ocean, is an excavated hollow place or basin, the bottom of which is several feet above high-water mark. As the rollers come in they dash violently against the face of the rock, rise in mingled water and foam to a very considerable height, and splash over into the basin. The water thus caught in the basin does not fall back into the ocean, but runs through the tunnel into the aquarium and maintains its high level. Between that level and the level of the ocean, in the cave, where there is no rock to dash against and no splashing, there is a fall, as indicated by the running stream above mentioned, of several feet, enough to furnish very valuable water-power.

It is obvious in a glance that the principle of gaining a head of water thus applied may be made of great importance not only to Point Lohos, but at many other points along the coast. Though the main body of water to be caught is only during high tide, there is hardly any limit to the amount that may be thus secured, provided the basin is large enough and not too elevated. The stream running from Mr. Sutro's aquarium is large enough, as has been stated, to run a mill; and it is evident that it can be relied on with certainty as long as the ocean maintains its level and its rollers come in as they have been coming in for uncounted ages. With the stream thus secured, and capable of increase by simply enlarging the basin, it is plain that great practical ends may be easily and cheaply achieved.

A New View of Mt. Shasta.

We give herewith a new view of Mt. Shasta from a recent photograph by Taher, which presents the mountain and its environment in a somewhat different aspect from previous engravings. The view gives also a hint of the recent advance in industrial development, for in the middle ground is the rapidly growing town of Sissons, occupying ground very near the site of the hospitable hostelry, which has been known for years as the outpost whence the tourist turned his back on civilization and sought the solitude of the trail to the summit. Now the scream of the locomotive and the hammer of the home-builder wake echoes where but recently the voices of the forests were only accompanied by the sharp crack of the hunter's rifle. There has been wonderful growth during the last few years through all the country

conclusions are very erroneous. The towering Alps do not lead to a misconception of sunny Italy, nor should Shasta reflect a chill, even in thought, upon the genial regions which owe their winterless climate in part to the protection afforded by his massive form and by the ranges which inarch their ridges on either side to support his pedestal. A recent writer has commented upon the majesty and beneficence of Mt. Shasta as follows:

Of all American mountains it has the most sovereign look. It leans on no other height; it associates with no other mountain; it builds its own pedestal in the valley and never droops its icy crown. It is a glory in itself. It seizes the clouds with icy arms and compresses them until their contents are dropped upon the thirty fields below; from its base the Sacramento starts on its way to the ocean; despite its frowns, it is a merciful agent to mankind, and in the minds of those who see it in all its power and splendor, a picture is painted which will

A Dry Washer.

The dry-washing gold machine in use in the Osceola (Nevada) placer mine is said to be panning out in a way that is astonishing the miners. The machine separates and collects the free gold irrespective of fineness or shape from gravel, sand, loam and other debris.

This is the machine manufactured by James B. Freeman, the inventor and patentee. It is called "Freeman's Success Dry-Process Gold Separator," and from all accounts appears to do its work perfectly, by collecting, separating and saving fine gold from gravel, loam and other debris, known as placer ground, by a dry process. Very little power is required to operate the largest-sized machine made, a boy 14 or 16 years of age easily furnishing the power for a machine of 50 tons' capacity per ten hours. Other than hand-power may be used if required.

from the placers of Idaho since their first discovery.

When once these machines have been introduced into the many districts in California where dry auriferous gravel beds are known to exist, it is confidently predicted that a mining excitement almost equaling the good old "days of '49" will take place. One noteworthy feature of "Freeman's Success" is the ease and facility with which it may be transported from place to place, it being very light and easily taken apart so as to be packed on "burros" or other animals, or carried by men. The 50-ton machine weighs only 120 pounds, and can be divided into halves to facilitate packing. Two men can operate this size to good advantage, although it requires five or six men to supply it with dirt to operate it to its full capacity.

Three sizes are manufactured—a 50-ton, 100-ton, and a small prospecting machine weighing only 27 pounds, and capable of working about

VIEW OF MOUNT SHASTA WITH THE TOWN OF SISSONS IN THE MIDDLE GROUND.

whence Mt. Shasta's lofty crest can be described. Both in Northern California and in Southern Oregon progress is the order of the day. Homes are being multiplied, natural resources which have long waited the touch of enterprise are being developed, and the future is full of promise.

Mt. Shasta has been appropriately termed the keystone of the arch formed by the great incurving mountain chains of California, the Coast Range and Sierra Nevada. Though the great floor of the Sacramento valley terminates about on the southern boundary of Shasta county, in a foothill region, half-circular in shape, there is beyond this the upper valley and its many arms with their inclosing hills and mountains, forming a country rich and picturesque, which extends northward many miles before the higher mountains close in and place the crown of eternal snow aloft on Shasta's brow, 14,440 feet above the level of the sea.

It has been frequently remarked of late that the great snow-covered mountain, through the dissemination of engravings of it reproduced from the masterpieces of the artists, has really given distant people the impression that Northern California was an arctic region and Central California must therefore be semi-arctic. Such

last as long as the gift to admire anything magnificent is left.

The engraving shows in the clearing at Sissons the way the march of progress is changing the face of the country. Rapid deforesting of the area may be expected, as we understand that about ten sawmills are now running to their full capacity in the Shasta region.

Our picture is one of a series of photo-facsimiles prepared by the Dewey Engraving Co. for a handsome publication by J. C. Steele of the Denver & Rio Grande Railway, illustrating California scenery. This is another enterprise which will tend to make California better known.

KEELY MOTOR.—W. B. Le Van, the expert appointed by the court to examine the Keely motor to determine whether or not it is a fraud, has reported to the court that the generator shown him by Keely was a stationary structure, dependent upon the manipulation of an operator, and could by no possibility be made self-operating.

COAL FIND NEAR ASTORIA.—There is considerable excitement at Astoria over the reported finding of coal near that city in paying quantities, and about 50 persons have filed claims aggregating 8000 acres.

The action obtained in this separator is produced wholly by the expansion of air and not by velocity, and there is no blast to drive the gold from the riffles. The finest particles of gold, irrespective of shape, are saved, and when once the debris has passed through the machine it is not possible to find a particle of gold in the tailings. The drier the material to be "washed" the better, although the separator works well in quite damp ground. These facts are learned from persons who have thoroughly tested the "Freeman's Success." Without any exception they declare that perfection has at last been attained in gold dry-washing.

Every old Californian, like the writer of this item, knows that there are many thousands of acres of rich placer ground in the Golden State upon which it is impossible to get water, but which by the use of this invention may be made to give up the golden treasure. The same is true of Idaho, Montana and Nevada. The golden sands of Snake river, which are found in the banks and bars for hundreds of miles along that great stream, may be worked to good advantage, as the finest of flour gold remains in the machine after the sand has passed through. Its introduction upon Snake river alone will result in adding more millions to the world's supply of noble metal than have ever been taken

two tons per day. The cost of the 50-ton machine is \$125; 100 ton, \$200; prospecting, \$25. Machines of greater capacity are furnished to order. Mr. Freeman has also invented a pulverizer, which will pulverize the smallest particles of clay or cement, and thoroughly clean from the stone all particles attached thereto, thereby liberating the gold and preparing the debris for thorough separation.

The inventor spent many years in efforts to produce a light machine of great capacity that would save gold, and having succeeded, his fortune is assured. His invention affords the hundreds of men who have spent fortunes in the vain attempt to save the fine Snake-river gold, an opportunity not only to "get even," but rich. The future operations of this wonderful gold-saver will be watched with great interest by the miners and all dwellers in the Pacific States and Territories.—*Utah Union*.

A TALL SMOKESTACK.—What is probably the tallest smoke chimney in the world is now being completed at East Newark, N. J. The base diameter is 28 feet. It is solid brick to an altitude of 310 feet. At its top it is nine feet in diameter. A cast-iron rim 20 feet in diameter, and a bell, surmount the whole, and make the total height of the structure 335 feet.

Passing Events.

The time of the public has been pretty well occupied this week with election affairs. In National affairs the Republican party has been successful in electing its ticket. Now that all the excitement is about over we can once more settle down to every-day business.

The reduction works at National City, San Diego county, have commenced operations, starting with some ore from San Bernardino county. About 100 men are employed. It is intended to put up smelting furnaces shortly.

The sale of the Vulture mine for the large sum of \$900,000 is a good thing for Arizona. That Territory badly needs capital to develop its mines, but has had very little of late years.

Mention is made in another column of a decision relative to running mining tunnels into adjoining agricultural land. This is a very important matter to miners, in view of the way the mineral land in this State is being taken up by agricultural claimants.

We give in this number of the PRESS a map showing the path of the coming total eclipse of the sun. This will be found convenient for reference by all our readers.

Mine Ventilator.

A recent report of the Mines Ventilation Board of the colony of Victoria on the subject of the ventilation of gold quartz mines at Sandhurst has many points of interest. The mine-owners there, not expecting that the claims would pay at any great depth, did not provide for carrying air down their shafts. The works have, however, been put down, until now there are numerous shafts from 1500 to 2000 feet deep, and the result is there has been difficulty in ventilating. The report goes into the subject very fully and gives the testimony and experience of all the mine superintendents. The information derived will be of interest to California miners. After a careful review of the evidence and the notes taken during personal observation in a number of mines, and having inspected all the mechanical appliances in use for ventilating that were brought under notice, the opinions and the recommendations may be summarized as follows:

That the best system of natural ventilation is that of carrying down winzes simultaneously with the shafts, but even with such a system there may be portions of the workings (such as long ore shoots, etc.) where natural ventilation should be resorted to.

That in cases where the sinking of winzes has been neglected, and a large expenditure of time and money would now be necessary to make a proper upcast and downcast, some mechanical appliance, such as a blower or fan, should be immediately adopted where required to supply the miners with pure and cool air.

That Root's blower has been found to be a good machine for forcing air down mines.

That where circumstances are favorable, holding through from one mine to another secures good ventilation to the depth at which the connection is made.

That for the future more attention should be paid to having the shafts of a sufficient size to allow of pipes being put down for mechanical ventilation.

That all new shafts should in future be close timbered.

That the bark should be taken off all timber before being sent down for use in mines.

That proper sanitary regulations should be enforced in every mine and disinfectants supplied.

That where practicable a water spray should be provided for laying the dust in mines when necessary.

That every mine manager should have a thermometer fixed in some convenient place in the principal workings.

Ordinary atmospheric air consists of about 79 measures of nitrogen and 21 of oxygen with 1-2500 part of a measure of carbonic acid. The rate of increase in temperature is, as a rule, 1° for every 64 feet, but the rate is not constant, there being many circumstances connected with different mines calculated to disturb the uniformity.

An adult breathes from 14 to 16 times in a minute, inhaling from 30 to 40 cubic inches of air at each inspiration, and expelling a like quantity. Inspired air loses nearly five per cent of its oxygen and gains a corresponding amount of carbonic acid gas. Air containing more than six parts in 10,000 of this gas is unwholesome; 20 parts in 10,000 will cause permanent injury to persons of delicate organization, while air containing 10 parts in 100 is fatal. A simple test for detecting the presence of this gas in unwholesome quantities is the following: Take a 10-ounce bottle of air and place therein one half ounce of clear lime-water. Cork and shake up. If no precipitation of carbonate of lime take place, the air is good.

At the Broken Hill mines, N. S. W., boys are paid four shillings a day for sorting rock on top; miners receive 10 shillings, and engineers and carpenters 11 shillings per day. There is no Saturday afternoon or Sunday work. Most of the miners live in tents and board themselves, as board and lodging in the few hotels costs \$30 to \$35 a month. Water is brought into the town in carts from a distance of 30 miles, and costs about \$1.50 per 100 gallons.

The machinery for the 50-ton sampling works at National City, San Diego county, is on the ground.

They are talking of building a "salt palace" at Salt Lake City, Utah.

A Prospecting Dredge.

A device for prospecting the bottoms of rivers and streams for gold has just been patented through the MINING AND SCIENTIFIC PRESS Patent Agency by John Hatch of this city. The device has two hollow scoop-shaped buckets, having the upper inner angles hinged to lugs which project from a horizontal shaft. The lower edges of these buckets oppose each other, so that when closed by force they will gather up any material which may lie between them, and when opened the lower edges are separated sufficiently to allow the material to be deposited where desired.

A shank or shaft is secured to the horizontal shaft so as to extend upwardly from its center, to which it is secured by a set screw or other convenient device. A nut is fitted to travel on threads of the screw, and this nut is secured by set screws in the hollow tubular shank. A groove or channel is turned in this shank, just above the nut, and around this groove is loosely fitted a sleeve having lugs upon opposite sides, and in these lugs the upper ends of the connecting rods are hinged. The lower ends of these rods are hinged to the upper outer sides of the buckets.

Within the hollow shank may be fixed a long stout pole or handle, which enables the operator to drop the buckets down upon the bed of the stream at any suitable depth. By turning the handle round, the nut will be turned and caused to travel up the screw threads, so that the connecting rods traveling with it will draw the outer edges of the bucket upward and toward each other, thus separating the lower and cutting edges so that they stand widely apart. In this position the device is lowered upon the bottom which it is desired to prospect; and by turning the pole in the opposite direction the buckets are closed and may be drawn up with the gravel or other material, which may then be examined. A slightly different construction is made when the power needed is not so great as that of the screw.

Growth of the Postal Service.

It is estimated at the Postoffice Department that the deficiency in the revenues of the postal service of the fiscal year just ended will be about \$4,000,000. Last year the deficiency was something over \$500,000. Owing to the cheap rates of postage, especially for newspapers, the bulk of mail matter has increased at such a rate that the cost of the service has grown immensely. The force of employees, especially in the large offices, is taxed to handle the vast quantity of matter that is daily poured in.

In some instances the newspapers are not sent to the offices at all, but are weighed and stamped at the office of publication by some one authorized to do the work, and the bags are sent directly to the railroad depots. Were this not done, it is stated that some of the large postoffices would be overwhelmed and that it would be impossible to handle the matter with dispatch and accuracy. It is believed by the post office officials that the statistics for the year just closed will show a large increase in the number of letters mailed.

At present England is the greatest letter-writing nation in the world. The annual ratio of increase in this class of mail matter is much greater in this country than in England, and if the present rate continues, in a few years the United States will stand at the head as writing more letters per capita than any other people. The bulk of mail matter, or the number of pieces handled by the United States postal service, is now greater than any in other country, but this is mainly due to the extensive circulation of newspapers.

Bismuth ore of good quality has recently been discovered in Sinaloa, Mexico. It is reported that the "honzan people" have sent an expert to examine this mine. The ore looks very well, but is not, apparently, as rich as that found in Serata, Bolivia. The demand for bismuth is limited, and it would not take many tons to satisfy the market.

A PRIVATE letter from Port Townsend reads: "R. Dunsen & Sons are contemplating opening another mine contiguous to the East Wellington mines. There is some talk also that the Alexandria mines will soon be put in operation."

Leaching Department of the Marsac Mill.

This addition to the Marsac mill, Park City, Utah, is fast approaching completion. All the buildings are finished, and work on the interior is going ahead at a rapid rate. Several of the tanks are ready for use at the present time.

We are told that one receives at once a favorable impression of the leaching process after passing through the panroom of the Marsac and continuing on to the leaching department for the use of the Russell process, and contrasting the two methods of treatment. To operate the panroom, containing 16 5-foot pans and working from 65 to 70 tons per day, there is required a powerful engine making 63 revolutions per minute solely for the purpose of driving the "line shaft," from which is taken the power to run the pans, settlers, agitators, cleanup pan and quicksilver elevator. This work requires 58 pulleys, 27 sets of gearing, 28 jack-shafts, 30 belts, 80 journals, etc. Then there are the foundations and framework to carry this machinery and support the pans, settlers and agitators, each of which is a machine of itself, needing constant attention and frequent renewal of its wearing parts. Besides this, there are several pipe lines and the necessary appliances for conveniently handling heavy castings.

The leaching department of the Marsac will be capable of treating 120 tons per day, or nearly 100 per cent more than the present panroom, at about the same daily expense; consequently ore of much lower grade can be mined and milled. In this department double the work that the pans can do will be done in four large wooden ore-tanks, six precipitation-tanks, three solution-tanks and three iron sulphide tanks. Besides these there is a pipeline, a three-compartment trough alongside the ore-tanks and a filter press and drier.

A comparison between the panroom and leaching department, as regards castings required, is very significant. The total weight of castings in the Marsac panroom is 371,770 pounds, while to do twice the work in the leaching department only 28,520 pounds of castings will be used.

OCCIDENTAL.—This Comstock mine during the past year produced 383½ tons of ore which has been milled, yielding billion of the assay value of \$52,624.75, of which amount \$14,605.55 was in gold and \$38,019.20 was in silver, the average yield being \$13.73 per ton. The expenses for the year were \$91,544, and two assessments were levied, one of \$20,000 and the other of \$25,000. The new officers are as follows: Geo. R. Wells, President; Joseph Marks, Vice-President; H. Zidig, Geo. Frier and E. B. Holmes, Directors. A. K. Durrow is Secretary, and D. B. Lyman, Superintendent.

A PARAGRAPH is going the rounds of the press to the effect that E. E. Barnard of the Lick Observatory has, with the big telescope, discovered a comet. He has discovered a comet, but not by means of the big telescope. A very small glass is used for comet seeking, and Mr. Barnard does not use the 36 inch lens for his special work.

LEAD PENCIL AND INK.—A notice posted on a claim at the head of Mill Creek canyon by Chas. Nye in 1879, written with a common lead pencil, still remains as clear and legible as ever, while another near by, written with ink, and evidently posted some years later, cannot be deciphered.—*Homer Mining Index.*

OVER 1000 feet of iron pipe has been shipped to the Livermore coal mines. The pipe is to be used in conveying water to the mines from one of the many springs that are found in that locality.

BUILDING improvements in San Francisco aggregate in value \$5,593,577 for the first 10 months of this year. For each of the past three years the record is about the same.

A HEAVY list of assessments will become delinquent this month. Nevada mines ask for \$585,800, and California mines, \$33,500, out of the total of \$619,300.

A QUARRY of brownstone of fine quality has been found at Raymond, Fresno county, near the railroad. It is to be developed with vigor.

The Solar Eclipse of January 1st.

The total solar eclipse which will occur on January 1, 1889, will be an event of great astronomical importance. To citizens of California and Nevada it will have special interest, since the path of totality—or complete obscuration—crosses these States over an area favorable for observation. There will not be another total solar eclipse anywhere in this part of the world during the remainder of this century.

We have shown on the excellent coast map of the Pacific Railroad Gazetteer the path of

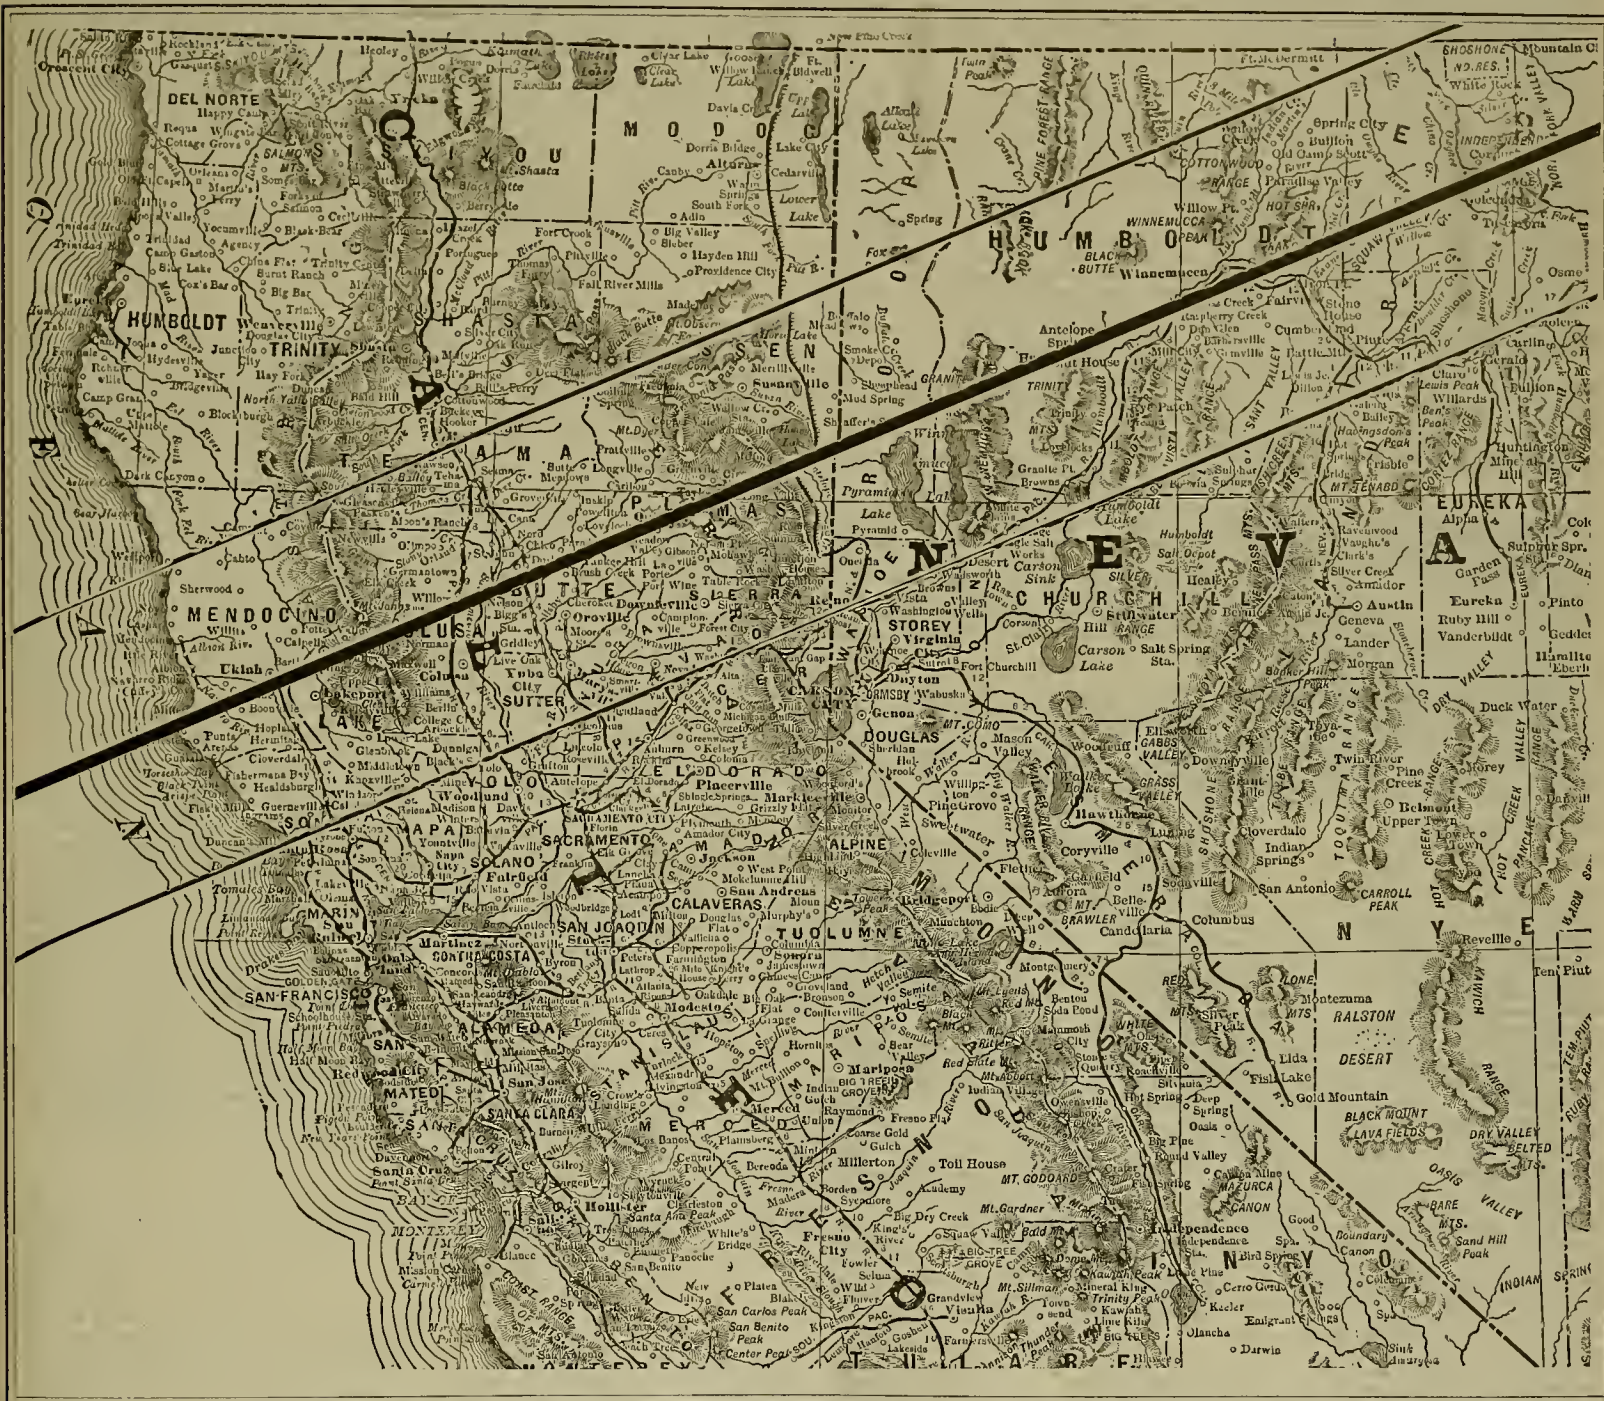

central point of the moon's shadow will cross the Western Nevada line at a point 32 rods north of the 124th mile post. The south edge of the moon's shadow will pass about half-way between Reno and the highest point of Peavine mountain. Thus Reno will be just outside the shadow. The center of the path will be about six miles north of Winnemucca, and 29½ miles north of Tuscarora. The south edge of the path will pass north of Wadsworth and south of Pyramid, Lovelocks and Humboldt House. The north edge of the path will pass north of Buffalo Meadows, Willow Point, Paradise Val-

ern and southern lines the amount of obscuration decreases gradually with the distance both north and south.

It is greatly to be hoped that there will be clear weather, though January is an unfortunate time of the year for astronomical work here, since it falls in the middle of the wet season. The Royal Astronomical Society has published a letter of Prof. E. S. Holden of the Lick Observatory, giving the probable meteorological conditions. He gives the records of cloudiness at various California stations for the last 15 days of December and the first 15 days of

that a number of eclipse expeditions will be formed in the East and come to California, and some observers are expected from Europe. Photographers will accompany all these parties. Members of the Pacific Coast Amateur Photographic Association are making preparations for the event and will occupy different points along the line of totality.

BIG LAND GRAB ATTEMPTED.—A dispatch from Santa Fe states that one Hodges has notified Surveyor-General Julian that he and his brothers and sisters are the rightful owners of

MAP SHOWING PATH OF TOTAL ECLIPSE IN CALIFORNIA AND NEVADA JANUARY 1, 1889.

the eclipse. In all that area embraced between the upper and lower lines which we have drawn on the map the eclipse will be total. The central line shows the path of greatest totality. Above the northern line, and below the southern line, the eclipse will not be total. The best places for observation in this State are Point Arena, Ukiah, Bartlett Springs, Willows, Chico, Quincy, Loyalton, Oneida, Long Valley, Milford, etc. All places on or near the center of the path will be in darkness for about two minutes of the time.

At the central line, near Oroville, the totality will be 114 seconds; at Point Arena it will be 120 seconds. It will last from 108 to 120 seconds—longer nearer the coast than in the interior.

In Nevada the shadow of the moon will cross the western line at the town of Verdi, and its breadth is so great that from Verdi north along the boundary for a distance of about 100 miles there will be total darkness of the eclipse. The

ley, Spring City, Willow Creek, Cornucopia and White Rock, and will pass ten miles south of Fort McDermitt.

This eclipse from beginning to end will be very long. For instance, at Point Arena, the beginning of the eclipse will be 1 hour and 10 minutes before the beginning of totality, and the end will be 1 hour and 16 minutes after the ending of totality, the whole lasting over 2½ hours. It begins at that place at 0h. 15m. 11 secs. mean time. For standard Pacific time, 14m. 58 secs. should be added to that.

In San Francisco the eclipse will not be total, but very nearly so. About eleven-twelfths of the sun will be obscured. Here it will begin at 23 minutes 7 seconds past 12 o'clock, and end at 9 minutes 6 seconds past two o'clock. The time of greatest obscuration is at 43 minutes 43 seconds past 1 o'clock.

Citizens of this State and Nevada can see from our map the cities and towns within the limits of the totality path. Outside the north-

January, but prefers not to express any definite opinion on a subject so uncertain as California weather in January. He simply presents the data.

Time signals from the Lick Observatory are received daily (at Pacific standard noon) at nearly every railway station in California. On the days immediately preceding and following the eclipse they will be automatically transmitted from the standard clock, and special pains will be taken to make them useful to observing parties in the field.

The observing party from the Lick Observatory intend going to Bartlett Springs, with their instruments, which will include a spectro-scope. Mr. Burckhalter (Chahot Observatory) and party will go somewhere between Cloverdale and Ukiah. Mr. Blinn (Blinn Observatory) will go to Winnemucca peaks, Nev. Prof. Davidson (Davidson Observatory) will probably go to some point in Nevada, in the hope of getting good weather. It is expected

a tract of land 30 miles square, containing 600,000 acres, in Colfax county, N. M. The title to this vast territory is claimed under a grant alleged to have been made by the Crown of Spain in 1635 to the present claimants' natural ancestors, who bore the peculiar name of Corpus Christi. The land claimed is located in the vicinity of the towns of Raton, Springer and Folsom, and probably includes the last two named towns. A portion of the Maxwell grant and large numbers of claims of settlers are jeopardized.

BISON TAKEN ALIVE.—It is stated in a dispatch from Cheyenne that some cowboys, while gathering heaves last month on the Sweetwater river, in Fremont county, Wyoming, ran upon a herd of 23 buffaloes. They followed them ten miles and captured six calves by lariat. Two of the calves were choked to death, but the remaining four are in a pasture on Sweetwater river, about 16 miles north of Rawlins.

MECHANICAL PROGRESS.

A New Machine for Making Horse-shoe Nails.

In a locked room in a shop in Pawtucket, R. I., stands a machine, the invention of a Rhode Island gentleman whose reputation as a civil and mechanical engineer is not confined to this country alone. The invention is kept almost as completely apart from the crowd as the Keely motor, but there is the very pronounced difference between them that this motor will "mote." It is a machine for making horseshoe nails, and represents seven years of experiment and study by John A. Coleman, and the expenditure of tens of thousands of dollars. It is fully protected by patents, and, says the Providence Journal, in the opinion of competent judges—men engaged in just this line of manufacture—is destined to work a revolution in that industry.

The object sought to be accomplished is to make a nail which shall be tougher than those in general use, which will not split and which will not crack the hoof; in short, a better nail in every way than any now in use. Mr. Coleman makes his nails by cold drawing from blanks considerably shorter than the finished article. The machine, which takes advantage of simple natural laws, is strictly automatic, the only attention required being that a supply of blanks shall be provided, and these may be delivered to it in a tangle just as they are dumped out of a keg, and that the machine shall be kept oiled. The essential parts are few in number and positive in action; in fact, the whole machine is wonderfully simple when the work it does is considered. The finished nails have as fine a polish as if rattled, and a long, even taper to a point as keen as a needle's. A new nail just from the machine dropped from the height of the walet will stick upright in the floor at one's feet.

It is said that these nails have been thoroughly and satisfactorily tested in competition with standard makes of horseshoe nails. Although the machine is larger than its commercial issue will be, as it represents the evolution due to years of thought and development, it presents an interesting study in the manifest employment of the most direct means to effect a desired result, and is mechanically very satisfying. The machine will occupy but little floor space, and its design combines grace with ample strength. It is attracting much attention from men in the horse nail and allied industries, and just before the writer was ushered in the manager of a company of iron-workers employing 5000 hands took their departure, after spending nearly half a day in inspecting the machine with a view to negotiations.

They Admit That American Machinery Beats Them.

It is a remarkable fact, says the *Iron and Steel Trades Journal*, London, that in the manufacture of different kinds of machinery, the Americans can beat us in price. Wages in the United States are about 50 per cent higher than in this country; materials are from 25 to 50 per cent dearer; yet the finished machines can be put on the market cheaper. It is true that the Americans cannot send out machines to neutral markets any cheaper than is done by our manufacturers; but it is surprising that they can, at least, meet us in price. The chief explanation, as we pointed out in a leader in the last issue of the *Journal*, is in the fact that in the United States the inventive faculty is impelled and sharpened by necessity, and has been applied to the designing of labor-saving tools. The stagnation and lack of trained brain-power among our manufacturing engineers are largely traceable, we think, to the fact that the engineer and engineering have pooch-pooched the idea that the Americans are ahead of us in any respect. While those journals which profess to be the mouth-piece of the engineers have scouted the idea that the engineers of this country are second to the American engineers in any respect, the engineers who have visited the United States have almost unanimously returned with the impression that in setting out manufacturing establishments of the best class in America, the object kept steadily in view is the need of cheap production. Our iron and steel makers supply our engineers with the best and cheapest material the world produces, and there is no room for doubt that our iron and steel producing establishments are in every respect in front of the works in the United States. Our engineers forfeit many of the advantages which the iron and steel masters confer on them in the shape of cheap and good materials by their comparative failure to utilize labor-saving tools.

So long as our iron and steel masters supplied the engineers with materials much cheaper than could be done in other countries, there was not so much necessity for the engineers scheming out devices to cheapen the cost of production; but with the prices of raw materials in other countries gradually approaching the quotations ruling on our markets, the engineers must more and more bestir themselves in the direction of discovering labor-saving machines for use in their workshops.

PROFIT ON CAR-WHEELS.—A careful and itemized statement of the cost of making car-wheels has been prepared and published by E.

Warne of Easton, Pa., based on figures obtained from actual practice in the Taylor Iron Works at High Bridge, N. J. The iron used was three-quarters charcoal pig, at \$26 50 per ton, and one-quarter old wheels, at \$19 per ton, equal to \$24.62 per ton for the stock, four wheels being made from one ton. The cost was \$7.86 for each wheel. These wheels are sold at \$8, thus leaving a profit of only 14 cents per wheel. At that rate of profit there must certainly be a strong inducement to economize in every step in the process of manufacture. Yet this is a class of manufacture, above all others, on which a sufficient profit should be allowed to secure the very best of materials and the very best possible care at every point of production. A parsimony on the part of railroads which should reduce the profit on the wheels of their cars to 14 cents each should receive a most pronounced rebuke from the traveling public and from legislative and administrative bodies everywhere.

A MECHANICAL FILTER FOR PUTRID WATER ON A LARGE SCALE.—A filter of 1,500,000 gallons daily capacity was recently tested at Seneca Falls, N. Y., and brought out very favorable comments from the mechanical engineers and others who witnessed the trial. The plant is the largest manufactured for filtering this quantity of water in one shell. A local paper in describing the test says: The experiments with the Hegeman & Oliphant system of filtration here have attracted wide interest. Here is a hoiler-iron vessel which could be placed in any ordinary room 12 feet in length. Into this vessel is let, through a six-inch pipe, any water available, however tainted. The last test was made before Mueller, the engineer of Spreckels' sugar refinery at Philadelphia. The filter is at Gleason Mills, and on Thursday it took in stals and putrid water at the rate of 700 gallons a minute and delivered it as clear as crystal. Mr. Mueller declares that no greater or more trying test was ever made, because finally the inlet was stuffed with fire-clay, which all chemists consider the most difficult of filtration. B. B. Davis, the superintendent of the Gleason Knitting-Mills, and Frank C. Beebe, the superintendent of the Gleason & Bailey Company, with Irving Lewis, his assistant, declare that the test was perfect, that the filter was run without the use of any chemicals, and that the simplicity of the system was eminently practical.

CUTTING STEEL HOT OR COLD.—A correspondent of the *American Machinist* gives his experience in cutting steel as follows: About cutting hot and cold steel, I would state my experience, which goes to prove that you must run the saw slowly for cold steel, and not at a high speed. For hot steel the saws are usually about 3' 6" to 4' 6" diameter, and run at high speed (800 to 1000 revolutions per minute). The teeth are simply punched out, and when worn, re-punched. For cold steel, both bend and circular saws are used, and the speed is according to what is being cut, and varies from 100 to 300 feet per minute. These circular cold-steel saws are now much used for cutting off the "head" of steel castings, and answer better and are quicker than the older method of cutting off in the lathe or slotting machine.

A THREE-THOUSAND-TON SHEAR.—Carnegie, Phipps & Co. of Monhall, near Pittsburgh, Pa., have recently set up what is undoubtedly the largest shear in the world. It is rated at 3000 tons, and forms a part of their famous slabbing mill. The shear is worked by the descent of the upper blade, which is effected by the introduction into the cylinder of water under a pressure of 4000 pounds to the inch. The cylinder is a heavy steel casting weighing about 25 tons. It is 13 inches thick on the bottom and 17 on the sides. It is 37 inches deep. Its total outside width is 8 feet and 11 inches. The shear has a capacity for cutting a piece of steel 48 inches wide by 24 thick. A careful study of these dimensions will afford some idea of the magnitude and power of this immense tool.

A NEW WRINKLE IN WHEEL TIRES.—In England, especially in cities where street railroads are common, a tire is made for the wheels of road vehicles which, instead of being of uniform width, is made wider at intervals of a few inches, the object being to avoid the breakage of wheels and axles when coming against the side of street car rails. The shoulders between the wide and narrow parts are sufficiently abrupt to make the wheel mount the rail as soon as one of the shoulders comes in contact with it, and the aliding and sideways pulling, which is the cause of so many wrecks of carriages and wagons in cities, is avoided.

EFFECTIVENESS OF MACHINERY.—An English paper says: As an instance of what can be done by using labor-saving machinery, we may state the gradual introduction of new appliances in a foundry and engine shop has resulted in 50 men producing as many castings as was formerly turned out by 200 men.

A NEW STREET CAR MOTOR run with gas made automatically from crude petroleum was recently exhibited in Chicago. The inventor claims that it is capable of a speed of 15 miles per hour at a cost of less than \$1 per day.

RAMIE MACHINES.—France follows India in offering large premiums for the invention of a machine for decorticating ramie fiber, which in gloss and luster approaches the finest silk and promises to become invaluable.

SCIENTIFIC PROGRESS.

HUMAN IN CONNECTION WITH MACHINE ANATOMY.—Machinists often find it necessary to so arrange the construction of their machinery as to properly fit certain parts to be conveniently handled and worked by operators. To this end human models are often kept in drafting-rooms—made to various scales pertaining to the drawings on which they are used. These are usually constructed, says a contemporary, of pasteboard, cut out with a profile representing a vertical "fore-and-aft" section of an average-sized man. The different pieces of pasteboard are jointed together with an ordinary eyelet at the neck, shoulders, elbows, hips, knees, and sometimes middle of back. They need not be very accurate, and take but a few minutes to make. Such a model can be laid upon a drawing of the proper scales and the relative positions ascertained of treadles, tables, hand-levers and various projecting points, thus avoiding interferences and adapting handles, treadles, knee-levers, etc., to the anatomy of the operator, whom the model vicariously represents for the time being. Models of horses and other animals used with machinery can obviously be made in the same way. Other sections than the one mentioned can, if desired, be shown. For instance, a man can be shown in back or front view when used upon similar views of machines to be operated.

CHANGES IN THE MARKINGS OF MARS.—The observations of M. Perroux at Noe, and M. Terby at Louvain, and, in England, of Mr. Denning at Bristol, have confirmed the presence on the planet of most of the "canals," or narrow dark lines, which were discovered by M. Schiaparelli in 1877, and at subsequent oppositions. M. Perroux has also been able to detect, in several cases, the gemination or doubling of the canals, and M. Terby has observed the same phenomenon in one or two cases, but with much greater difficulty than in the opposition of 1881-82. But some curious changes of appearance have been noted. An entire district (Schiaparelli's *Lybia*) has been merged in the adjoining "sea," i. e., its color has changed from the reddish hue of the Martial "continents" to the somber tint of the "seas." The district in question is larger than France. To the north of this district a new canal has become visible, and again another new canal has appeared to traverse the white north polar cap, or, according to M. Terby, to divide the true polar cap from a white spot of similar appearance a little to the south of it. With the exception of these changes, the principal markings, both light and dark, are those which former oppositions have rendered familiar.

HOSTILITY TO NEW THINGS.—A universal law of social progress, with which we are all familiar, is that established systems in thought, morals, manners, government, or any department of human activity, struggle to perpetuate themselves by a fight against all innovations. Whatever is new and progressive, or represents the requirements of an enlarging field of life, has got to gain its foothold in the face of the powerful opposition of the old and pre-established. Those more perfected and exact conceptions of nature, which we call scientific ideas, have prevailed only after centuries of moral strife with the inherited superstitions and imperfect generalizations of our semi-civilized forefathers. The progressive and liberal governments of our most advanced nations to-day have been established in spite of the bitter opposition of their predecessors, and are themselves fighting tooth and nail the higher forms that will succeed them. In literature and art, old schools strive to deny existence to the new; and, even in the little affairs of our daily lives, we are all permitting the things that are, and "have sufficed to our fathers before us," to keep out the better things that might be.—H. G. S. Noble.

THE INCREASING RAINFALL.—The great increase of rainfall throughout the United States during the last 15 or 20 years has been attributed by many to some electrical disturbance in the atmosphere, brought about by the many and constantly increasing lines of rails which are continually being laid down in every direction. But now comes a correspondent of the *Northwestern Railroader*, who advances a different theory for the increasing prevalence of floods and rainstorms. He says that there are over 30,000 locomotives in use in North America, and estimates that from them alone over 53,000,000,000 cubic yards of vapor are sent into the atmosphere every week, to be returned in the form of rain, or over 7,000,000,000 cubic yards a day—"quite enough," he says, "to produce a good rainfall" every 24 hours. Estimating the number of other non-condensing engines in use as eight times the number of locomotives, the total vapor thus projected into the air every week in this country amounts to over 470,000,000,000 cubic yards. "Is this not," he asks, "sufficient for the floods of terror? Is there any reason to wonder why our storms are so damaging?"

A NOVEL PYROTECHNIC DISPLAY.—One of the most novel pyrotechnical displays on record was that which formed a feature of the centennial celebration at Pittsburgh, when the Allegheny river was illuminated by natural gas. A large pipe connecting with a natural gas main was laid under the river, with a jet below

the surface of the water. When the gas was turned on the pressure carried a column of water with it and blew it into spray. After the gas was ignited by sending a rocket into the column, the effect is said to have been very beautiful. The flame was also colored by an arrangement on the river-bank for forcing chemicals into the gas main, which caused red and green fire.

A CURIOUS PHENOMENON.—A curious thing happened in Bowling Green, New York City, during the progress of a thunder-storm which visited that city on the 17th ultimo. According to a New York paper, several persons who were standing under the shelter of the Field building when the first heavy thunder-clap was heard, were surprised to hear another report almost simultaneously. Instantly a flame shot four feet into the air from the opposite corner in Bowling Green, the heavy iron cover to the electrical subway manhole was hurled into the air, and the street pavement was torn up and piled in a heap over an area 20 feet square. A similar eruption took place around the manhole in front of the Field building. The entire day was required to plaster up the rents in the manholes and replace the pavement. Strange to say, the electric wires were undisturbed, and the gas main that lay near the manholes was uninjured. Whether the manhole was struck by lightning, or whether there was only an explosion of gas, was made a question for violent debate among those who witnessed the accidents.

FIREPROOF WOOD.—Edward Atkinson, the Boston economist, says a New England genius has recently discovered a cheap method of dissolving zinc by combining it with hydrogen and producing a solution called zinc-water, and that this liquid applied to certain woods makes them absolutely fireproof. Without attempting to discuss the chemical problems involved in this professed discovery, it may be said that if the discovery be genuine it is one of the most important of the age. It will decrease the loss by fire to an incredible extent and will completely revolutionize fire insurance. It seems hardly credible that wood can be rendered fireproof, at least by any method which will be within the limits of men of moderate means; but, in view of the discoveries of modern science, it is unsafe to say what can or cannot be done. There are already chemical compounds which render cloth and similar fabrics fireproof, and it is at least possible that the inventive genius of a New England Yankee may have accomplished the success with which Mr. Atkinson credits him.

A GREAT FIND OF EARLY PAINTINGS.—Seeking in Lower Egypt, during the present years, for remains of the wonderful Labyrinth of 3000 chambers described by Herodotus, Flinders Petrie seems to have found what he sought, with the pyramidal tomb of its builder, and also came upon a great cemetery, whose existence had hitherto been unknown. This cemetery covers about 100 acres, and dates from the Græco-Roman period, one or two centuries after Christ. From it Mr. Petrie has taken hundreds of mummies, with a vast collection of objects buried with them. These articles include funerary vases, amulets, toys, a tinued copper mirror, a horned lens, a set of leather-workers' needles, a flint knife, and—by far the most interesting and important—a splendid series of portraits, painted upon the cases of elaborately handgilded mummies, and representing the living persons whose remains were placed in these coffins 17 centuries ago. These pictures will add an important chapter to the history of art.

CURIOUS FORMATION OF CRYSTALS.—If a lump of pure granulated chloride of ammonium be carefully introduced into a solution of nitrate of lead, held in a wide-mouthed bottle, there will soon appear pillars of crystals, resembling in some respects the amorpho-crystalline appearance of commercial starch, or, more accurately, angular snowflakes. The result is very beautiful, but, besides, affords an excellent opportunity to notice the mode of formation. The minute crystals of chloride of lead will be seen to rise from all sides, at the base of the forming pillars, and, ascending above their summits, will describe an inward curve, and fall on top. The process being continued, the pillars will rise rapidly. This is interesting as bearing on the cause of crystalline form. If commercial fibrous chloride of ammonium be used instead of that described, the result is extremely remarkable from an artistic point of view, but does not show the currents so distinctly.

FLUORIDE OF NITROGEN.—The supposed compound was formed by passing an electric current from seven ferric chloride batteries through a concentrated solution of ammonium fluoride. After the lapse of a short time, several drops, of oily consistence, were observed attached to the negative plate. On becoming connected with the positive, a thin gold wire, these drops exploded with violence. The compound is highly unstable, being at once decomposed in contact with glass, silica, or organic matter, thus rendering the analysis of the same one of considerable risk. Its explosive violence is even greater than that of the chloride of nitrogen.

A NEW ISLAND.—An island has suddenly risen 3½ feet above the surface of the water in the harbor of Vera Cruz. The city itself was recently visited by a cyclone, an earthquake and a waterspout.

USEFUL INFORMATION.

Substitute for Glass.

A translucent material intended for use as a substitute for glass for many purposes has been introduced in London. This material exhibits the quality of pliancy in the greatest degree; in fact, it may be bent backward and forward like leather, and be subjected to very considerable tensile strain with impunity. It is almost as translucent as glass, and is of a pleasing amber color, varying in shade from very light golden to pale brown. The basis of the material is a web of fine iron wire, with warp and weft threads about 1-12 inch apart. This is inclosed, like a fly in amber, in a sheet of translucent varnish, of which the base is linseed oil. There is no resin or gum in the varnish, and once it has become dry it will stand heat and damp without suffering any change, neither hardening nor becoming sticky. The manufacture is carried out by dipping the sheets edgewise into deep tanks of varnish and then allowing the coating which they thus receive to dry in a warm atmosphere. It requires more than a dozen dips to bring the sheet to the required thickness, and when this has been accomplished it is stored for several weeks to thoroughly set.

It will be readily understood that a material produced in this manner will not be as cheap as glass in its first cost. If it is to obtain a place in the market, it must be either from its greater advantages or from some saving which it effects in the items of erection and maintenance. It is claimed for the woven roofing that it is economical in every way. It absolutely abolishes breakages; a man may fall upon it or drop a ladder upon it without damage. The large size of the sheets, 10x4 feet, renders the joints very few, and these can be made absolutely tight by the use of varnish between the overlapping edges. No glazier is required to apply the material; it can be cut by a pair of strong scissors, and be nailed in place by any ordinary workman. The frames to carry it may be extremely light, and their construction of the simplest. Curved surfaces can be glazed as easily as flat, and if a great amount of light be required, the entire roofing may be made of this material. The sun's heat gets through with difficulty, so that no awnings are needed. The Westminster Aquarium has been lately re-roofed by it, and, it is said, greatly to the comfort of the audience.

THE MANY USES OF CASTOR OIL.—Under the above head, a current paragraph gives the following particulars of the product of the castor bean: The oil is specially adapted for lubricating all sorts of machinery, clocks, watches, etc., and it is an excellent lamp oil, giving a white light far superior to that of mineral oils, petroleum, kerosene, linseed and all other oils, whether vegetable, animal or mineral; it also gives very little soot, and, all things considered, has been pronounced the cheapest oil known. All the great perfumers of London and Paris use castor oil for the manufacture of golden oil, so well known for its property of keeping the head cool, and the skin and its pores, as well as the roots of the hair, soft and open. The oil is used for textile fabrics, to fit them for dyeing or printing, for which purpose the India dyers and printers invariably employ it; and it is one of the best oils for dressing tanned hides and skins of all kinds, on account of its imparting to them such a degree of strength, durability, tenacity and beauty. From the oil cake, in addition to its other uses, a gas is obtained which gives a superior light, some of the stations on the East India railway being illuminated in this way. The oil dissolves completely in alcohol, and this, incorporated with a solution of copal, makes a varnish which, it is said, is very useful in polishing all kinds of first-class furniture, carriages, picture frames, cloths, canvas, etc.

HOW OIL-TANKS SHOULD BE EMPTIED OF OIL. Explosions frequently occur from gas generated from the careless emptying of oil-tanks. Such a one recently occurred on the steamer *Ville de Calais*, employed in the oil trade between Philadelphia and Calais, which excited much interest in shipping circles, particularly among agents and captains identified with sailing vessels, who argue that further explosions will put a decided check upon the building of steamers to compete with them. Respecting the cause of the explosion, one of the parties interested says: "The tanks must have been full of gas, left after the 15,000 barrels of petroleum which she carried had been pumped out; and then there must have been carelessness in examining the tanks. The first thing done after emptying the tanks is to fill them with water. The petroleum still remaining rises on top, and, when the tanks overflow, runs out. It is then that the tanks are examined, and in doing this the same safety lamps are used that are used in mines. Even after the tanks are empty, if a careless sailor, after lighting his pipe, threw the match down the hatch, just such an explosion as rent the *Ville de Calais* asunder might ensue."

GLASS CLOTH.—Duhns Bonnet of Lille, France, has invented a process of spinning and weaving glass into cloth. The warp is composed of silk, forming the body and groundwork, on which the pattern in glass appears, as affected by the weft. The requisite flexibility of glass thread for manufacturing purposes is to be ascribed to its extreme fineness, as not less

than from 50 to 60 of the original strands are required to form one thread of the weft. The process is slow, for no more than a yard of cloth can be produced in 12 hours. The work, however, is extremely beautiful and comparatively cheap. A French paper, commenting on the discovery, says: "When we figure to ourselves an apartment decorated with cloth of glass and resplendent with light, we must be convinced that it will equal in brilliancy all that the imagination can conceive and realize; in a word, the wonders of the enchanted palaces mentioned in the Arabian tales."

ANOTHER EXPLOSION FROM DUST.—An explosion recently occurred in the great manufactory of the American Pencil Company, in Jersey City, caused by the spontaneous combustion of red cedar wood dust, which, passing through the dust-arrester, flew from the sawing-room to the boiler-room. There was a sharp explosion as the fine burst, and the flames flashed 300 feet into the sawdust heap in the boiler room. About 400 girls and men who were at work in the building escaped, with a single exception. Too little attention is paid to the danger from explosions from dust. It is only a few years since any thought was given to the matter—in fact explosions from dust were unheard of 20 years ago. Such explosions were attributed to other or unknown causes.

TO TAKE IMPRESSIONS FROM SEALS OR COINS. To take an exact model of any coin, medal, embossed stamped paper, or, in fact, any device raised or imprinted, cut a piece of card-board, with which form a ring just the dimensions of the impression to be taken, then pour within the said ring melted fusible metal. The carding will prevent the metal from running away, and in a few minutes it will cool, and the impression taken will be the same as the original, but reversed. Fusible metal is a compound of eight parts of bismuth, five of lead, and three of tin, which liquefies at the same temperature as boiling water.

THE LEBEL RIFLE AND POWDER.—It is said that 350,000 Lebel rifles have been issued to the French army. Not only the powder used, which gives them their great superiority, but the construction of the rifles themselves, is a jealously guarded secret. The soldiers who have used the powder in their firing practice do not even know its color. The powder is distributed to them in cartridges. All that is distributed is either used at once or returned to the officers in charge when the practice is over.

TESTING ROOFING SLATES.—In testing roofing slates, the samples should first be carefully weighed, and then put into boiling water for a quarter of an hour. The water should be fairly free from lime, saltpetre and ammonia. The slates are then reweighed, and those that show the greatest increase in weight are those most capable of resisting deterioration.

NEWSPAPERS IN JAPAN.—It will, no doubt, surprise most readers to learn that Japan has nearly 100 daily newspapers. The first was started only 18 years ago.

GOOD HEALTH.

Cold Water Before Breakfast.

A learned physician recently imparted knowledge to a New York man who mixes drinks. The story is told as follows:

A thin, tall man got up early the other morning at the Fifth-Avenue hotel, and, coming downstairs, ordered two glasses of water at the liquid refreshment counter. The trained bartender smiled, but handed out two large glasses full of pure cold water. The man smacked his lips and said it was a healthy drink before breakfast, and one that he recommended.

"You look thin, sir."

"Yes, I do; but if I had not drunk cold water before my breakfast I might have been in my grave long ago. I am a physician, or rather was one before I retired, and have made a study of liquids. Water, drank freely before meals, has a very beneficial result, for it washes away the mucus secreted during the intervals of repose. The membrane thus cleansed is in much better condition to receive food and convert it into soluble compounds. In the morning the accumulation of mucus is specially marked when the gastric walls are covered with a thick, tenacious layer. Now, food entering the stomach at this time will become covered with this tenacious coating, which for a time protects it from the action of gastric ferments and retards digestion. Your man with a tubular contracted stomach, with its puckered mucous lining and viscid contents, a normal condition in the morning before breakfast, is not suitable to receive food. A glass of water washes out the stomach, gives tone and prepares the alimentary canal for the morning meal."—*N. Y. Mail and Express.*

Treatment for Rheumatism.

EDITORS PRESS:—How a man who was suffering with rheumatism cured himself: "I sweat it out. Some think it is the mineral water, but it isn't; it is the sweating," he said. "How did you treat yourself?" "I took a bath in water as hot as I could bear it."

"How long did you remain in the water?"

"Until I was short o' breath—the first time about 20 minutes, the second about 15, and the next a little less. After the bath I was wrapped in blankets and sweat for three hours. I had the rheumatism in my hips and feet. Five baths cured me. I sweat it out."

—ROCK MAPLE.

MAKING THE BLIND SEE.—"A new operation has been discovered by which the sheath of the optic nerve may be opened," said an oculist recently to a reporter for the *New York Mail and Express*. "By this means the pressure upon the nerve can be released, and, in some cases, total blindness cured as well as relieving the brain. The membranes which invest the brain, and are continued down to the eye in the form of a sheath which surrounds the optic nerve, secrete a certain amount of fluid, and whenever there is an excess of this secretion the pressure within the cavity of the skull is increased, and often finds its way down to the level of the eye, causing, in many instances, total blindness. For years oculists have been trying to find a method by which this could be relieved. One oculist tried to feel his way to the nerve without the aid of light by means of an instrument carrying a concealed knife which was projected by a spring. This method failed. Another devised a method of operating by which the sheath was exposed to view. Four cases were operated on in this manner. One case failed; in the other three cases the patient's eyesight was restored, and they were relieved from all pain arising from pressure on the brain. This is a very important discovery, as a great many persons suffer from this ailment."

FRESH AIR FOR THE BABY.—If your work is such that you can't give baby a long daily air bath, do the next best thing. After he has his morning bath, put on his wool hand (knitted hands being the best, for they hug the howels snugly), and a linen shirt can be worn over them during July and August, putting on a little flannel sacque toward night to protect the arms), then the napkins, little socks, and a slip. Disperse with the skirts if it is very warm. Put baby on a blanket on the floor, in a room where the purest air obtainable is in abundance, and the sun is streaming in, purifying every nook and cranny. Let the mite roll and kick to his heart's content while you are busy with your work. Remember this is only a substitute for something better, when mother's duties keep her at home the greater part of the day. When you can take the child out, put on the skirts, etc., and do so. If you have a little yard spot, take along a heavy blanket or fur mat, spread over a place the sun has warmed, and let baby roll around there; it will be better than keeping him fastened in his perambulator, or even in your arms.—*Good Housekeeping.*

NATURAL RECOVERY FROM HYDROPHOBIA.—A 14-year-old boy was recently attacked with genuine hydrophobia. He had been twice bitten by a rabid dog. He began frothing at the mouth, barking, etc., when physicians were called in who tied him down in bed. When water was shown him he became frenzied, and the doctors said there was no doubt of the case being hydrophobia. They watched the progress of the terrible disease until the patient became unconscious the next morning. After a few hours he began to revive, and in the evening was apparently quite well. Local physicians declare this the first case on record of a recovery from hydrophobia. There is no statement as to his having taken any medicine. Nature frequently "works in mysterious ways its wonders to perform." This was probably a case in point. The books record several instances of the disappearance even of unmistakable cases of cancer in the same way.

DEATH FROM SEEDS.—Two people in my neighborhood have died within five or six years from eating grapes, the seeds of the grapes getting into the appendix, which is the term commonly given to a small intestine which leads from the large intestine. It is but a few inches long, and comes to an end like a pocket. What its use is in the digestive economy has not been made out, but when a grape seed, or hit of oyster shell, or any unyielding substance slips into it in its passage through the body, the result, I believe, is uniformly fatal, and death ensues in four or five days, after intense suffering, cramps, inflammation and swelling of the bowels. No remedy avails anything—the pain finally ceases and then the end is nigh. I have known of three young men of brilliant promise who have been slain by the grape seed, a post-mortem in each case revealing the cause of death.—*Rural New Yorker.*

ABORTING FELONS.—The *Therapeutic Gazette* recommends the following treatment for felons, which has proved successful in a vast number of cases when applied before suppuration had begun. The entire finger is covered with ointment of nitrate of mercury, to the thickness of about one-eighth of an inch, and then wrapped in sticking-plaster. This dressing is left on for 24 hours, after which no further treatment is needed.

HOW I PREVENT MY HAIR FROM FALLING OUT.—**EDITORS PRESS:**—Whenever it commences to comb out, I put alcohol on the scalp and gently rub with tips of fingers. Continue the treatment once in two or three days until it ceases to come out. This stimulates the growth. Four or five applications will usually cure for the time. A little rubbed on occasionally is beneficial.—ROCK MAPLE.

ENGINEERING NOTES.

The Largest Flume in the World

Now Being Constructed in San Diego County.

The boom in Southern California, two years ago, inspired the people of San Diego to take measures to secure a supply of water for irrigation and for domestic use adequate to meet all possible wants for both purposes. To do this a company was organized to take out water from the San Diego river at a point in the mountains some 40 miles in the interior. The character of the country over which this water has to be brought is extremely difficult for such work. No less than eight tunnels have had to be excavated, the largest of which is 2100 feet in length. Thirty-six miles of heavy fluming has also been built, requiring the use of 9,000,000 feet of lumber. Some idea of the amount of this lumber may be had from the fact that it constitutes no less than 40 large shiploads. Not less than 315 trestles were required to convey this flume over depressions—the longest of which is 1700 feet and 65 feet high.

The water from the flume is emptied into a large reservoir about ten miles from the city, from whence it is proposed to carry the water in pipes to San Diego.

The work has now been completed to the reservoir. The contractors for the supply of lumber were Messrs. Moore & Smith, lumber dealers of this city. The contractors for building the flume were Messrs. Carle, Croly & Ashernathy of Sacramento. The lumber was mostly redwood from Mendocino county. Redwood strictly clear and free from knots was used exclusively in the box of the flume. This flume is said to be the largest ever built in any country. The work of laying the pipes from the reservoir is now in progress and is comparatively free from any special engineering difficulties.

Some idea of the difficulties that have had to be overcome in the construction of the flume may be gained from the consideration of the fact that much of the lumber had to be drawn 700 and 800 feet up the sides of steep and rocky mountains. The lumber was loaded on cars that ran on a portable track. The cars were attached to a heavy wire cable. The motive power was furnished by a portable engine.

In regard to the mechanical work done in the construction of the flume, all who have examined it declare that it is first-class in every particular. Engineers have carefully fixed the grade every mile, in order, as near as possible, to insure perfection in that important particular. The flume has a uniform grade of 4 7-10 feet to the mile.

A Novel Process for Dredging Water Channels.

The *New York Evening Sun* describes a novel process employed to cut out Sandy Hook har. The steamship *State of Alabama* has been chartered and equipped with nearly \$100,000 worth of machinery of enormous capacity and new design. One of the gentlemen interested in the contract thus explained the plan: "We chartered this ship to experiment with the Riker dredging system. It is a system strikingly original and effective. Over the sides of the ship fore and aft we have constructed outriggers of massive oak timbers, capable of sustaining tons and tons of strain. From these are suspended out dredgers. Now, these dredgers are not at all like the ones you have seen operated by steam engine, raised and lowered between poles, and bringing up a cartload of mud every three or four minutes. That is all done away with. Instead of loading one pocket in a scow in two hours, we load this very ship on which you stand in less than 20 minutes as full as she will hold, and in another 10 minutes can empty her again, without ever stopping our engines or slackening our headway. We run over the ground to be dredged with a full headway, and fill the ship with the sand from the bottom of the ocean as we pass.

"Over the sides of the ship are great iron tubes, three or four feet in diameter, known as telescope tubes. The forward ends can be raised or lowered within a scope of 30 feet. On the other end is a revolving cutter. The rear ends of the tubes connect, through a series of huge valves, with the inside of the hold of the ship. In operation the tubes work very simply and very effectively. The cutter stirs up the sand to a depth of four or five feet, and the force of the vessel through the water makes a suction which causes the sand to rush through the tubes and valves, into the hold of the ship. The valves, opening inward, prevent its running out again. We can throw in a stream of sand and water two feet in diameter, and keep it up till the compartments are filled as full as the vessel will carry. Then we pump off the water from the sand-pits by means of a vacuum pump."

The vessel can be emptied of the liquid mud and sand in about 10 minutes by means of powerful vacuum pumps. The vessel is expected to accomplish in two or three hours what it formerly took a hundred dredges a day to do.

Two tests have been made, and the second worked to the full satisfaction of the inventors, except for some leakage in one of the valves.

ANOTHER NEW COMET was discovered by Prof. Barnard at the Lick Observatory, at 4:51 A. M., October 31st.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MILL.—Amador Ledger, Nov. 3: Frank Littlefield is having a ten-stamp mill erected on his quartz claim near Big Bar bridge, which is called the River mine. He informs us that he has a strong ledge, 12 feet wide, and that it is all milling ore, and from appearances will pay well. The mill when completed will be one of the best of its size to be found in the county. At the North Star mine, drifting in a southerly direction is being prosecuted, and the indications are fair. The managers are satisfied with the developments. No quartz of a paying character has been met with, but they have still strong hopes of finding a good-paying mine.

LINCOLN MILL.—The Lincoln mill has been undergoing some repairs preparatory to starting up. Mr. Stewart expects to start the mill immediately after the first rains, and hopes to run it steadily.

SUTTER CREEK.—Cor. Amador Dispatch, Nov. 2: The hanging wall in the North Star is dipping east, a good indication. The progress made at this mine is unprecedented in the history of mining in the county. The Wildman mine is looking considerably brighter.

DRYTOWN.—Cor. Amador Dispatch, Nov. 2: Barney & Voorhies' sulphurets works will close down the last of the week, there being no more sulphurets on hand. The Cosmopolitan has finished sinking and will start a crosscut east from the 500-foot station the first of next week. The North California is now working two shifts crosscutting west; will reach the shoot of ore in about 100 feet. The Grover is running steady. Everything looks well in the mine. All of the new pipe is now on the ground; are laying it very fast; will be completed about Jan. 1st.

Calaveras.

MURPHYS.—Cor. Mountain Echo, Nov. 1: Mining is still being pursued with energy and perseverance and with prospects of success. The Norfolk Mining Co. is actively engaged in developing its property and extracting quartz of a fair quality. Ore is now being hauled to the Oro Plata mill for reduction. The quartz is not free-milling, but will be crushed and the pulp carried over the concentrators and the concentrates sent to the reduction works for final treatment.

ANGELS.—Mountain Echo, Nov. 1: Work is progressing quite actively at the Ulica mine in this town. The mill is being built as rapidly as circumstances will permit. The work is kept up day and night with the hope of completing the mill before the rain sets in.

NEVILLS.—Blasting surface ground for filling-in purposes in the slopes of the Nevil's mine in this town, is being prosecuted with much vigor. Everything in and about the mine is in first-class order. Sinking will be commenced in a short time.

Fresno.

HILDRETH HAPPENINGS.—Cor. Fresno Republican, Nov. 1: The Abbey shaft is down 700 feet. A level is being run on the ledge, and the indications are very favorable for the development of a large body of high-grade ore. The usual amount of ore is being extracted from the upper levels, and everything in connection with the mill and mine is running smoothly. The Lillie was closed down about a week ago, but will resume operations again shortly.

Mariposa.

At SHERLOCKS.—Gazette, Nov. 3: Capt. Diltz left on Thursday morning for sawmills above, to procure sluice lumber for his mine. He contemplates constructing as soon as possible 500 feet of sluices to his mining operations at his mine on Sherlocks. This mine has always been valuable for its placer as well as its quartz. In years past, whenever there has been a rainy season, such as is needed for placer mining, Captain Diltz, with his string of sluices, about 400 feet in length, has washed out a big gap in the mountain from which no small amount of gold has been extracted. Frequently some rare specimens of from \$1 to \$50 and \$75 are picked up or found in the sluices. His principal operations of placer mining have been, heretofore, on the south end, or "south side," as it is called, of his claim. The quartz vein and claim, which is patented, is about evenly divided by a sharp ridge, which passes through it at right angles; hence, in speaking of it, the "north side" and the "south side" is the distinction referred to. Therefore, on the north side and connected with the patented quartz claim, the Captain has a placer-mining claim, which over-shadows Sherlocks' gulch, known to be so fabulously rich in the days of '49, when the man Sherlock first discovered the rich gulch. Captain Diltz has waited patiently several winter seasons for water enough to justify him in setting the sluices and breaking in upon this placer ground, to which he attaches great value. Feeling that a rainy season, sufficient for mining purposes, is due to California at least once in a decade, the Captain is determined to gamble on the chances that this is the wet winter so eagerly looked forward to and wanted badly at this time.

Mendocino.

SILVER.—Mendocino Dispatch Democrat, Nov. 1: Mr. H. M. Daniels of Anderson valley was in town yesterday and brought with him a bit of intelligence which will be hailed with interest and satisfaction by the people of the whole county. He has discovered a lead of silver ore on his ranch, near Christine, that bids fair to prove a veritable bonanza. A shaft has been sunk to a depth of 75 feet, and six men are now hard at work developing the mine. A sample of surface ore sent to San Francisco last week assays \$9.82 to the ton, and Mr. Daniels is certain that the ore now in sight will run far richer.

Mono.

THE BODIE.—Mono Relief, Oct. 30: During the past week the west crosscut from upraise from 300-foot level was advanced to feet. Upraise from same was extended 5 feet. The winze from the south drift, 400-foot level, was advanced 14 feet. South drift, on first incline level was driven 19 feet. The pump was started and the water is being lowered about 12 feet per day. There are 95 feet of water in the shaft.

THE BULWER CON.—For the past week north

drift, 200-foot level, was driven 19 feet. The north drift, 200-foot level, was advanced 18 feet.

THE STANDARD CON.—East upraise, 300-foot level advanced 14 feet; west upraise, same level, advanced 17 feet; Bulwer level, south drift, advanced 10 feet; south drift, 400 level, advanced 18 feet.

Nevada.

NORTH EXTENSION.—Nevada Herald, Oct. 31: J. G. Hall of Cherokee, who owns the north extension of the Delhi mine, has great faith in the value of his location. His ledge is on the Sierra county side of the Middle Yuba river, and a tunnel can be run which will give from 600 to 700 feet of backs to stope from. Free water can be obtained for power to work the mine cheaply. The pay chute of the Delhi is said to pitch toward the north, and this encourages Mr. Hall in the belief that his location will develop into a good mine.

A BONANZA LYING IDLE.—In the cut near the old Pennsylvania mine, northwest of town, there is a quartz ledge, which in days gone by for a time paid the owners. There used to be a water-wheel on the property which did the hoisting and pumping, but the wheel got out of repair after continued use, and as other expenses fell fast upon the owners, the mine was allowed to fill up with water and has not since been worked. The mine was owned by Wm. Eddy and C. C. Leavitt, the former now deceased. In conversation with Mr. Eddy regarding this mine, some time previous to his death, he informed us that at the bottom of the shaft there still remained a lead 12 to 16 inches thick. Not many crushings were had, but the rock taken out was always high grade. We believe the ground was patented. If the mine was opened up it would be a good thing for the town. It is a pity that such quartz leads as the one mentioned should lie idle. In this vicinity there are many prospects similarly situated, but for want of capital they remain unworked.

A PROSPECTOR'S GOOD LUCK.—Transcript, Nov. 1: J. R. Nickerson came down yesterday from Washington district where he had been prospecting during the past week. He discovered while there an entirely new ledge, which he believes to be one of the richest ever developed in the county.

INCLINE COMPLETED.—Herald, Nov. 2: The new incline shaft at the Derby mine has been completed. The incline comes to the surface near the old McKillican shaft, which was attempted to be put down some 16 years or more ago. Heretofore there has been but one entrance to the mine since the tunnel was filled up, and that through a perpendicular shaft about 600 feet deep. Some time ago a perpendicular upraise was attempted, but it was found too difficult and costly. The incline will give better air for the mine, besides affording egress therefrom in the event that any accident should occur at the main shaft where the hoisting works are located, and the safety of the men is thus better provided for. The additional advantage of the shaft is that it can be used for raising the gravel when it becomes advantageous to do so. The depth of the new incline is about 550 feet.

OUTSIDE CAPITAL.—Grass Valley Tidings, Nov. 1: Our community and mining men generally will hail with delight the intelligence that at last and after many vicissitudes the Coe Mining Co. has effected an arrangement which will result in the development on an extensive scale of the company's property, situated just outside the northern boundary of the municipal incorporation. Mr. Wisley, bookkeeper at the North Star, was the gentleman who held the prior lease, and yesterday—the last day for the lease to run—he returned from Denver, Col., with the news that he had enlisted a wealthy and reputable mining man of that city in the enterprise. Last night the necessary papers were made out, stipulating that development work shall be instituted without delay and that the bond shall endure for one year. A 20-stamp mill with all the latest improvements is to be erected within the same period, at the expiration of which the Denver manipulator is to receive, without further cost, \$5,000 of the 100,000 shares comprising the Coe Co.'s capital stock; and shall be so desired, he may at that time purchase the remaining 45,000 shares at the rate of \$1.50 a share. In the event of non-compliance with any of these terms, all improvements made are to revert to the company. It is understood that Mr. Wisley will be manager of the Coe under the new regime. On Saturday the principal in the enterprise will arrive here. There is now a water-power hoisting and pumping plant on the Coe, and all that is necessary to afford resumption of development work is to oil the machinery, turn on the water and pump out the mine. Water-power for operating a mill is handy. With a 20-stamp mill, economical and intelligent management, the Coe should in due season be placed on the list of dividend-payers.

Placer.

NEW MILL.—Placer Herald, Nov. 3: A large force of men is at work at the Hathaway mine near Ophir, putting up a fine new stamp-mill, while the work of developing and opening up the mine goes steadily on. The company, under the management of Supt. G. W. Horn, means business.

Plumas.

THE DRURY MINE.—Greenville Bulletin, Oct. 31: During the last two months the force of men at work night and day have been pushing tunnel No. 2 ahead. At the face of this tunnel, the backs, up to No. 1, are 200 feet high. The ledge is now between 3 and 4 feet thick and increasing in size. The ore is of very fine quality and is estimated at from \$8 to \$15 per ton. The property now has a fine showing.

ARCADIAN MILL STARTED.—On Saturday last, the Arcadian mill started on ore from the Round Valley Consolidated. We learn that a body of very good ore is being extracted, and that the indications are that the mine will have a prosperous future. There is water in the Round Valley reservoir to run the mill about a month.

San Diego.

QUARTZ.—Julian Sentinel, Nov. 2: We were shown some very fine specimens of gold quartz from the Gold King mine Wednes-day. The mine is evidently a bonanza to its owners.

Shasta.

COPPER CITY.—Courier, Nov. 3: Theodore Popejoy was in town this week. His mines, embracing the Original Williams & Kellinger, contain a 6-foot ledge of milling ore, and from working as

says and tests the quartz will average about \$60 to the ton in gold and silver.

SOLD.—J. W. Conant is reported to have sold a group of his mines to an English company for \$150,000, and received part of the pay down.

IRON MOUNTAIN.—Work will be resumed on the Iron Mountain mill in a few days. Everything about the mine has been placed in first-class order; good work and results are anticipated.

Sierra.

ACTIVE WORK.—Sierra Tribune, Nov. 3: Last Saturday evening the good news was brought to town that the ledge had been encountered in the lower tunnel at the San Luis mine. On Tuesday last Ed Lawrence visited the mine, and from him we learn the following particulars: The vein was reached at a distance of 470 feet in the tunnel. It is about three feet in width and prospects very favorably. The distance between this tunnel and No. 1 is 240 feet, and to the surface it is over 400 feet. It is the intention to run ahead the tunnel a short distance further and then put through a raise and connect with the winze in No. 1 adit. After this connection is made, the work of developing the vein in both tunnels will be pushed ahead with vigor. It is the calculation to erect a mill next season. This company, consisting entirely of home people, has already expended in labor at the mine \$15,000.

SALINAS AND MERCER.—At the Salinas and Mercer mine six men are taking out ore. The mill will be started with J. Moss in charge as soon as water comes. The winter supplies are all in, and in fact all preparations are made for a good season's work. The ore going into the chutes and mill is hard to beat.

THE BUFFALO.—The mill machinery has all been delivered at the Buffalo mine, and the Pelton wheel and pipe has been hauled in this week. The mill building is framed and in a few days will be under cover. The two-story boarding-house and the blacksmith shop are completed. Twenty hands, including six carpenters, are on the pay-roll at present. There are about 1000 tons of ore on the dump. The developments in the mine never looked more favorable than they do now. No. 1 tunnel is run on the vein 350 feet. No. 2 tunnel is in a distance of 200 feet, and the vein in that quarter is looking splendidly. The tunnel on the south side of the creek has been run 60 feet. When this tunnel reaches into the bill 500 feet it will have a depth of 800 feet from surface. There is every reason to believe that a fine body of ore will be opened up on that side. The vein throughout the mine yields immense prospects, and this, together with the fact that it will average 15 or 16 feet in width, warrants the assertion that it is a very valuable property.

THE PERRY CON.—The Perry Consolidated M. Co. has advertised for bids to run 100 feet of tunnel at their claim.

MARGUERITE.—Superintendent Morris is pushing ahead operations at the Marguerite with vim. The new skips for raising water had been placed in position and yesterday the work of draining the mine was begun. There are two of these skips and they have a carrying capacity of 500 gallons each. It is calculated that with these skips in addition to the pumps the mine will be drained in eight days. The 20-stamp mill is being put in shape, and as there is some ore on hand it will be started up at once. A fine set of silver plates for the mill had just been received from San Francisco. Superintendent Morris proposes to make use of his patented process in the mill. As soon as the mine is pumped out a force of men will be placed under ground in making developments and taking out ore. Thirty-four men are at the mine at present, but all of these have not yet gone to work.

MOUNTAIN MINE.—The work of opening the Mountain mine is progressing steadily. No. 3 tunnel is within less than 180 feet from the pay chute. No. 4 tunnel is in about 60 feet. The upper workings of the mine show splendidly, and there has been for a long time sufficient ore in sight to warrant the erection of a big mill. This work, however, will not be inaugurated until next season. Oliver Sanderbaas since the purchase of this mine has expended an immense amount of money in developments.

DECATUR AND NORCROSS CON.—The above-named property is located in Lady's canyon and is owned by Messrs. Abbe and Flint. They have run 600 feet of tunnel at an expense of \$6500. Mr. Abbe alone has expended \$4000 in the enterprise. Work has been suspended for a couple of months past, but it will be resumed again in a short time.

PIKE CITY.—Cor. Nevada Co. Herald, Nov. 2: Mr. J. M. Holcomb, Thomas Callinan and Capt. T. W. Moore, the parties who are engaged in opening the North Alaska mine, went up to that location today. The mill is expected in a few days from the Nevada Foundry. Work on the new 40-stamp mill at the Red Chief mine is being pushed rapidly ahead. Mr. Wilson has a mill completed on his mine, which is situated on an extension of the same ledge, and he will begin crushing as soon as water is obtained. William and Richard Phillips have a mine on an old river-gravel deposit which they have worked for several years with varying success. Last week their tunnel tapped a deposit of very good gravel which has the appearance of being very extensive. In 1864, when this claim was first opened, and for a number of years thereafter, this was a dividend-paying mine. The Phillips Bros. took the property at a time when its prospects were very poor, and it has taken capital and muscle to go ahead.

Trinity.

TRINITY RIVER TUNNEL.—Trinity Journal, Nov. 3: John Bamber will add more planks to the dam and put in floodgates at the head of the tunnel, when it will be closed down for the winter.

NEVADA.

Washoe District.

BELCHER.—Virginia Enterprise, Nov. 3: Gond headway is being made with all repair work. The north drift on the 200 level is progressing favorably. Are running a joint drift to the Segregated Belcher for an air connection. A drain is being cut in the Suto tunnel drift.

SAVAGE.—On the 500 level the southeast drift is out 302 feet. The northeast drift, 230 feet from the north line, is passing into very favorable ground. Are stopping out ore of a good quality on this level (400) from the drifts north and south. On the 500

level (on the Norcross line) are extracting ore and putting in square sets. The ore, thus far, is three sets of timbers (about 18 feet) in width. The ore averages \$50 a ton. Are now extracting 60 tons a day, which is being shipped to the Rock Point mill, Dayton.

CON. CAL. AND VIRGINIA.—The usual quantity of ore has been extracted on the 1400 and 1435 levels and the ore breasts continue to look well. On the 1500 level are stopping ore from the parallel north drift, 60 feet north from the raise above that drift. Continue to stope ore from the southeast drift run from that upraise, 58 feet above the track floor of this level. The usual amount of ore is being extracted from the 1600 level and from the drift, 36 feet above said level south from the Ophir line. Ore of good quality is being extracted from several points on the 1650 level and the prospecting drifts are passing into ground of a promising character. The old stopes at the south end of the mine on this level are also looking and yielding well. The usual quantity of ore has been sent to the mills and the assays will average about the same as last week.

OCCIDENTAL.—In the upper tunnel they are repairing and retimbering the track. In the lower tunnel are repairing No. 2 and 3 chutes, 150 feet south of the north incline winze. The south drift has been extended 20 feet; total, 170. At a point 196 feet north of the winze leading to the lower levels have started a drift to connect with the south drift, and have advanced the same 26 feet. Have extracted 30 tons of ore and shipped to the Atlanta mill 37 1/2 tons of ore; assay value per wagon samples, \$29 per ton. Bullion shipped to San Francisco during October of the assay value of \$9475.06.

GOULD AND CURRY.—On the 200 level work in east crosscut from the top of the upraise from the 300 level (El Dorado level) has been suspended for the present. The west crosscut from the top of the same upraise has been extended 18 feet; total length, 98 feet. Formation, porphyry. On the 625 level the north has been cleaned out and repaired a distance of 160 feet.

BEST AND BELCHER.—On the 300 level in west crosscut No. 1, at a distance of 120 feet from main northwest drift, the winze has been sunk a distance of 13 feet; total depth, 22 feet. Formation, quartz and porphyry, showing some value. From the top of this winze a south drift has been started and advanced a distance of 29 feet; formation, porphyry.

CROWN POINT.—West crosscut No. 2 on the 700 level has passed through a heavy body of clay and reached a solid vein of quartz that assays from \$15 to \$25 a ton, about three-fourths of which is gold. The indications are that the find will prove large and of permanent value. A drain is being cut in the Suto tunnel drift.

ALPHA AND EXCHEQUER.—The north lateral drift in the Exchequer on the 382 level is still in porphyry, as is also the northeast crosscut on the same level. On the 500 level of the Alpha the north lateral drift is in quartz that carries some metal. The face of the south drift on the same level is also wholly in quartz.

HALE AND NORCROSS.—The west drift on the 500 level has been discontinued and the men set to work on repairs in other parts of the mine. Work is still in progress in the north and prospecting drifts. Three square sets of timbers are now in place across the width of the vein cut on the Savage line.

YELLOW JACKET.—The extraction of ore has not yet been resumed. The mine is in better shape both underground and on the surface than ever before in its history, and good work will be done when work is resumed in the ore breasts.

CHOLLAR.—On the 450 level the north drift is in quartz that assays as high as \$10 a ton. On the 750 level the west drift continues in material of a favorable character. The east crosscut on the same level is still in vein porphyry.

CONFIDENCE.—The work of extracting ore was resumed last Tuesday with a full force of miners. The ore is being shipped to the Brunswick mill for reduction. The mine resumes operations in thorough repair throughout.

JUSTICE.—The new mill is nearing completion. It will start up under favorable circumstances, as there is a large amount of ore on the dump ready for reduction, with some good bodies opened up in the mine.

SEGREGATED BELCHER.—Work in the south raise has been discontinued. Are now running an east drift, jointly with the Belcher, for the purpose of obtaining a much-needed air connection.

POTOSI.—The south drift on the 650 level continues in quartz and porphyry. On the 550 level east crosscut No. 2 is still in quartz, carrying some metal. The whole face is in quartz.

ALTA.—The batteries and concentrators are running on ore from the 725 and 825 levels. The mine is not only holding its own, but is also showing some improvement.

SIERRA NEVADA.—West crosscut No. 2 on the 520 level has reached the west wall. West crosscut No. 3 on the same level is still passing through porphyry and quartz.

ANDES.—The repairs to the shaft have been completed and are now cleaning up drifts preparatory to a resumption of underground operations.

UNION CON. AND MEXICAN.—The joint Union drift from the east drift from the Ophir shaft, 1465 level, is out 146 feet in Mexican ground.

SCORPION.—During the past week the west crosscut on the 300 level has been advanced 20 feet, making its total length 152 feet.

OPHIR.—Are cutting a drain and repairing the drift running south from the east drift from the shaft station on the 1465 level.

UTAH.—472 level—East crosscut No. 2 has been extended 50 feet; total, 236 feet. The formation is clay and porphyry.

LAOY WASHINGTON.—Work in the raise above the 725 level is being pushed ahead as usual.

BALTIMORE.—The usual prospecting work is being done and some ore is being opened up.

OVERMAN.—Prospecting work is still continued below the level of the main tunnel.

BULLION.—The usual work is in progress on the 500 and 600 levels.

Eureka District.

ORE SHIPMENTS.—Sentinel, Nov. 3: During the week the following shipments of ore have been de-

livered at the furnaces: From the Hamburg mine, 362 tons; Jackson mine, 215 tons; Dunderberg mine, 40 tons; Silver Lick mine, 24 tons; Helena Mortimer mine, 3 1/2 tons; Diamond mine, 16 tons; Whip-Poor-Will mine, 15 1/2 tons; Eureka Star, 9 1/2 tons; and the Nye Mining Co., 1/2 ton.

BULLION SHIPMENT.—Messrs. Wells, Fargo & Co. shipped yesterday 11 bars of Eureka Co. bullion valued at \$27,000, and during the week the Richmond Co. shipped 45 tons of rich lead bullion.

Jackrabbit District.

ONONDAGA.—Pioche Record, Oct. 31: The boiler and engine on the Independence mine was loaded on Culverwell's wagon Wednesday and hauled to the Onondaga mine at Jackrabbit the next day.

Jefferson District.

RUNNING.—Belmont Courier, Nov. 3: Charles Kanrohat's mill is running nicely, and his mine is looking splendidly.

Pioche District.

YUBA MINE.—Pioche Record, Oct. 31: The Yuba is now employing 30 men and continues regular shipments of high-grade ore. The work on the mine is mainly exploratory, however, the main bulk of the ore being left in the mine for better facilities which the railroad will bring. The deepest exploration is on the 1200-foot level, where the crosscut to the ledge from the shaft is within ten feet of the vein and where an important development is expected soon to be made.

Revelle District.

BELLE AND LIBERTY.—Cor. Belmont Courier, Nov. 3: The mines of Revelle still hold their own. Messrs. Bottomfield and Roman are getting plenty of ore from the Belle mine, and Messrs. Jordan & Marshall have a good thing in the Liberty. The prospects are looking well, but the owners do not wish too much of a rush here for a month or so.

Tuscarora District.

BELLE ISLE.—Times-Review, Nov. 2: East crosscut from north drift, 250-foot level, has been extended 10 feet. The indications are favorable for ore.

FOUND TREASURE.—Some necessary repairs have been made in the old shaft to preserve it for escape and ventilation purposes. The usual quantity of ore has been taken out and sacked for shipment.

NORTH COMMONWEALTH AND DEL MONTE COMBINATION SHAFT.—Total depth of shaft 90 feet. Progress has been slow on account of water. Sinking will now be suspended until the machinery is in place.

NORTH BELLE ISLE.—The face shows a little improvement. Some work has been done along the first stope above the 400-foot level. Good progress is being made with the work at the Union mill.

NEVADA QUEEN.—The stopes above the 350-foot level have increased in width, but the ore is not so high grade, the average assay from the battery pulp for the week being \$164.03 per ton. There have been 350 carloads of concentrating ore hoisted; average assay from car sample, \$22.85 per ton.

NAVAJO.—The stopes along the 350-foot level are looking well and are being put in shape for an increased output. The front stope along the 250-foot level is now being opened and stilled. Farther north, stopes are being started on the east vein, 300-foot level. At all points the output of ore is of a high grade. Will commence milling about the 7th inst.

COMMONWEALTH.—150-foot level: No. 2 winze from east lateral drift has been sunk 9 feet; it has been much harder than heretofore. No. 3 north drift from No. 1 east crosscut has been extended 16 feet, passing through seams of quartz and clay, showing a little mineral; 225-foot level: Main south drift from station has been advanced 18 feet, passing through some very hard rock, showing some sulphurets.

ARIZONA.

DIFFERENT DISTRICTS.—Arizona Journal-Miner, Nov. 1: Chas. Girdler returned yesterday from Groom creek. The Sucker mine, Turkey creek district, is being worked by four men. John S. Jones has been running the Standard mill pretty constantly of late. In the old Gray Eagle mine Doc. Bowen is at work taking out gold ore worth \$400 per ton. Walter J. Wright is running the Del Pasco mill on ore from J. R. Linton's Old Reliable mine. J. R. Boyer and Geo. W. Sessions have sold the Norman mine, Cherry creek, to J. H. B. Smith, for \$650. Fred Sattes is working on the Washington mine, Crook canyon, the ore assaying from \$20 to \$40 per ton in gold. Harlan & Barrington have plenty of water again, and are running their mill on Howard ore up to its full capacity. They talk of putting in a larger plant. Lew Elliott, a partner of Geo. W. Sines in the Mollie Stark claim, continues to take out good ore—\$140 gold rock. He has six tons sacked now for shipment to the sampling works. J. N. Rodenburg, from the Bradshaw country, gives a glowing account of the mines in that section. He says that miners were over so encouraged by the outlook for prosperity as at present. A. L. Kerr is in town superintending the shipment of machinery to Weaver district. On the arrival of a few articles which he shipped to-day, he will have his new 20-stamp mill ready to start. J. B. White, who has been superintending the erection of the Boaz mill at Minnehaha flat, came in from that camp to-day. He says the mill is ready to run, but they have not yet succeeded in getting their water supply in. Chas. Degend has just returned from the Santa Maria country, Eureka district, where he has been working a claim belonging to D. C. Thorne. He says the property is a very promising prospect. Mr. Rodenburg says that Jacob Henkle has a bonanza, and no doubt about it, in the Rapid Transit mine. He is taking out \$600 ore for shipment to the Prescott sampling works, and has from six to eight tons out now ready for shipment. He has recently let a contract to two men to sink 150 feet on the claim. The recent rains have furnished an abundant water supply for the Crowded King mine, and Mr. Sheldens is running it on full time day and night. Mr. Rodenburg says it is one of the best equipped mills in the Territory. Thus far they have been able to save by amalgamation up to 95 per cent of the value of the ore, which is good work. Col. H. A. Bigelow, from the Senator mine, reports that a crosscut from the old shaft to the old workings of the mine has been run to a depth of 130 feet, in which a body of ore 14

feet wide was encountered. He says the ore is good, some of it going as high as \$200 per ton, while none of it is worth less than from \$30 to \$40 per ton. The whole force of the Oro Bella company has been taken from the mine and is at work building a wagon road into the property from Minnehaha flat. It will take about a month and a half yet to complete this, when the machinery for their mill will be at once shipped in.

STOCKTON HILL.—Mohave Miner, Nov. 3: Tommy Trimball and a capitalist have commenced work on the Charlotte mine, a property belonging to the Gray brothers. Tommy McMahon has hired a crew and gone to work on his mine, the Young Hyson. The ore produced from this mine compares favorably with any in the district for richness. The Cupel still continues to produce a large quantity of high-grade ore, and Foreman Daly is putting on men as fast as the ground is being opened. The crosscut from the 206-foot level has been connected with the winze from the 120-foot level, which gives a good circulation of air and makes the working of the ore body much easier matter than heretofore. There are a good many rumors floating about about the C. O. D. going to sink another 100 feet, but as yet they have not commenced. That they will do so shortly, there is not a doubt. H. J. Brother, the superintendent of the Rattan mine, left Friday morning for St. Louis. He expects to be absent about two weeks, and will, during his absence, in connection with owners of the mine in St. Louis, contract for the necessary machinery needed for hoisting works and for treating the ore. The mine is looking first-class.

BRITISH COLUMBIA.

ABOUT \$3000 IN 60 DAYS.—Donald Truth, Nov. 1: Work was entirely suspended on Porcupine creek owing to the thermometer registering zero, and all claims have been laid over to June 1, 1889, when work will be resumed and prosecuted with vigor. The boys had several difficulties to contend against, but lack of practical experience was the greatest. The four men in the Discovery company have made \$6 a day to the man for every day they were on the ground, and averaged over \$15 a day for the days actually engaged in sluicing. Their ground was shallow, four feet to bedrock, but they worked intelligently under the direction of an old-time placer miner. Their largest nugget weighed \$11.30, the next \$10.10, and several that went over \$5. The dust is coarse, and was saved by the ordinary riddle, without the aid of blankets, plates, or quicksilver. This company will make preparations during the winter to work their ground on a larger scale next season. Next down the creek is the Sprague Co.'s ground. Although shallow diggings, time was frittered away until the season was nearly closed. They cleaned up about \$100, but their ground is known to be good. The Horseshoe Co. is next. They sluiced from the surface for awhile at the start; but became dissatisfied at the small returns and moved their boxes up the creek above the Discovery claim. They worked there for a time, then moved back to the lower claims again. Finally, they commenced a bedrock shaft, and had it down about 20 feet when they stopped for the season. They cleaned up less than \$100. Next came the Penetrating Co. They turned the creek, built a cabin, sunk a shaft 12 feet, and hunted. The Donald Placer Co. built a good cabin, a good ditch and dam, good sluice-boxes, commenced a good shaft, and stopped work for the season with good intentions. Their first and last cleanup yielded exactly \$7.96. Next came the Michigan Co. They were the first to begin sluicing, and the first to quit. They also sunk a shaft, but, for some reason, abandoned it before getting down to bedrock. They made a small cleanup. Next came a company that did not do anything but put up stakes to mark their 300 feet. Next, and last, the French Co., who have a shaft down over 37 feet. There is no question but gold is in the creek in paying quantities; but there is also no question that to obtain it the owners of the deep ground will have to do more intelligent and more persistent work next season than they did this.

THE TOAD MOUNTAIN COUNTRY.—Donald Truth, Nov. 1: On the last trip up to Revelstoke the steamboat Dispatch had aboard several well-known mine-owners from Toad Mountain. One of the Hall boys and John McDonald were among the number. They report having received returns from a trial shipment of 22 1/2 tons of ore sent to Anaconda, Montana, for reduction. The shipment netted them an even \$7000, after paying transportation and smelting charges that aggregated \$80 a ton. The ore carried \$308 in silver and \$2.50 in gold to the ton, besides giving 28 per cent in copper. The pay-streak from which this ore was taken is about two feet in width, although the ledge is 30 feet wide in places. Arrangements are being perfected to keep men at work on the claims all winter. About 100 men are in that camp at present.

COLORADO.

NOTES.—Georgetown Courier, Nov. 3: Mineral Chief is being opened at four places, and two more are to be started. Three are in big ore. Oneida is erecting an additional hoisting plant and will commence sinking on No. 1 adit. The Mary Foster shaft is to be sunk to a depth of 400 feet. Ore mills about \$300 per ton. A plant of hoisting machinery is being put up on the Lamartine, head of Trail creek. The breast of the 750-foot level on the Colorado Central shows an eight-inch vein of solid ore. Five men are at work extending the sluices on the Rombauer placer. The cleanup for the season is said to have been very satisfactory. The Golden Smelting Co. is making its last cleanup and will close the works before many days. Unfair treatment by the railroads is the cause. A lot of five tons of ore from the Jo Reynolds, milled at the Miners' Works in one class, returned nearly \$800 per ton. The ore is chock full of gray copper. Coley & Johnson, who have been milling their ore from the Trinidad through an arrastra, have been having very good luck. Their last run of nine days netted them \$212. Brown & Purcell are making money on the Edinburg—stopping over the second level. John Rutherford is driving the first level. Weiser & Co. are driving the second level. C. W. Evans has discovered another lode near the Evening Star, on McClellan mountain. Surface material assayed a few days ago, returned over 300 ozs. silver per ton and 13 ozs. gold. The tunnel level on the Little Jack has been extended 60

feet by the new lessees. They are driving for the ore chimney, which is still more than 100 feet ahead of them.

DAKOTA.

FLOAT.—Deadwood Pioneer, Nov. 1: The Axion Mining Company, with five good claims on Black Mountain, will be organized as soon as seal and charter arrive. We understand the capital has all been subscribed for except, perhaps, 10,000 shares. Albe Holmes was in from Carbonate yesterday and reports steady operations at the Albe, with encouraging results. Occasional shipments are made to Omaha, and the mine continues paying for its own development. The Bullion company has put a force to work taking out ore for the Galena smelter. Several tons have already been shipped. Good ore has recently been struck on the Eclipse, and its superintendent, Dick Richards, is confident it will shortly prove as valuable a piece of property as the Ruby Bell, adjoining. Another carload of coke for the Galena smelter is supposed to have reached White-water Sunday night. The plant will probably blow in to-day for a continuous run. The September cleanup at the Jenny Jewett mill amounted to \$7800 (mint returns), and that for October promises to be even larger.

RUBY.—Deadwood Pioneer, Nov. 1: A trip among the Ruby mines at present causes even an old-timer who has been away for a few months to open his eyes with pleasure and surprise at the new ore bodies that have been opened up very recently. The camp is filling up with men doing assessment work and more fully developing the numerous ore bodies. At the Eclipse, Dick Richards is driving a tunnel, running east from the south fork of White-tail. The tunnel is in about 40 feet. Ore was found 20 feet from the start, and at present is dipping considerably into the hill. The Eclipse cabin is filled with men at work in the vicinity.

TROY.—Hy. Ellington, superintendent of the above mine, has a force of men at work sinking a shaft to strike the continuation of the Harmony ore vein. Supt. Ellington has been engaged recently with Geo. Hopkins in surveying and ascertaining the pitch of the Tornado and Harmony ore vein, and finds from such observation that he will have to sink 52 feet to strike the regular ore body. Ore has been found in two shafts and a tunnel on the Troy that runs well.

MIKADO.—The old shaft is being retimbered and put in shape to commence sinking.

GLENWOOD.—Has run a surface open cut from creek level to nearly the top of hill and struck a 2-foot vein of good ore.

IDAHO.

VENUS.—Ketchum Keystone, Nov. 1: V. Domski shipped three tons of Venus ore Monday, which assayed 23 ounces in silver and 45 per cent lead. This is a little lower grade than the previous shipment, but may be considered the very highest grade lead ore mined in the Wood River country. There is plenty of ore now in sight for several months' stopping.

PHILADELPHIA AND IDAHO CO.—It is rumored that the Philadelphia & Idaho Co. will resume operations in their immense smelters at this point early next spring.

SNAKE RIVER.—The Mountain Home Bulletin says that Snake river is reported to be lower than ever before known at this season of the year. This gives the miners a great advantage in being able to work the bars at a greater depth than usual, and will cause much activity in placer mining on the Snake until a rise takes place.

BADGER.—The new hoisting works for this mine have been shipped in and are now being put in place. The Badger, according to every report, is in fine condition, exhibiting large ore bodies and an almost exhaustless extent of "virgin" ground.

MONTANA.

THE CARBONATE MINE.—Montana Mining Review, Nov. 1: The Carbonate mine, located four miles from Marysville, is looking much better than ever before. The tunnel is now in about 325 feet, and a raise was made to tap the shaft for air. The vein has widened and is now about seven feet wide. This is a very fine property and will prove a bonanza to its owners, Messrs. John and Andrew Neenan, of Marysville.

THE LEE MOUNTAIN MINE.—Work was resumed on the Lee Mountain mine at Rimini to-day (Wednesday) with a force of 20 men, and will probably be kept up all winter. It is also expected to start up the concentrator at Rimini within a short time, but before doing so the works will be overhauled and repaired.

THE GREAT FALLS SMELTER has started up and miners can have their ores worked at home. The company is now buying ores in any quantity. Their office is in the Gold block, Helena.

ORO FINO AND THE CHAMPION.—Montana Mining Review, Nov. 1: Everything is looking favorable in the Oro Fino district for a great mining camp at that point, and one which bids fair to rival Deer Lodge county's other famous mining section—the Phillipsburg country. As development work is prosecuted, it seems to demonstrate that in the near future the now nearly obscure Oro Fino region will reign a queen among the great mineral kingdoms of Montana. Probably no other property has done so much to prove the worth of this district as the Champion lode, in which another new strike is reported as having just been made, a 3-foot streak of ore appearing in the vein that samples over \$500 to the ton. The shaft has been sunk to a depth of 250 feet, and a crosscut is now being run. The ore referred to was struck 6 feet in on the crosscut. The Champion has a ledge of ore 30 feet wide, from which a sample cannot be taken anywhere that will run less than \$10 per ton, and from that figure up.

THE NEW SMELTER.—The Helena and Livingston Smelting Co. is pushing work as rapidly as possible on their plant in East Helena. Three stacks are completed, one being 140 feet in height and the others 100 feet each. The sampling works are about completed and will be started up by the middle of next month.

A GOOD CLEANUP.—H. S. Horton and Dave Orear, at the head of Dry gulch, have closed down

operations in their placer diggings for the year. Their last cleanup was made after a run of 20 hours' duration, with a small stream of water, and netted them \$54.90—something over \$4 per hour, which indicates that they have some remarkably rich diggings, and if they only had plenty of water could take out "bushels of gold."

NEW MEXICO.

CARLISLE.—Western Liberal, Nov. 1: The Carlisle Co. keeps 12 men employed on development work. One of the territorial papers recently announced that the smelting plant at Carlisle was a failure. At the time the announcement was made the smelter was netting \$7000 per month.

DEVELOPMENT WORK.—Silver City Enterprise, Nov. 2: The ore vein in the Golden Giant at Pinos Altos has widened to 34 inches of good solid ore. A pipe line from a spring at the head of Mill creek, three miles from the Key mill, will be laid by the Key Co. and an abundance of water obtained for milling purposes. W. C. Tonkui came in from the Ruby mine at Gold Hill this week. The mine is now showing about 14 inches of very rich ore. The sale of the Atlantic to the Deep Down Mining Co. will undoubtedly be consummated this week. J. R. Johnson, the energetic lessee of the Old Man mine, while in town yesterday informed a representative of the Enterprise that he has opened up a pocket of rich ore in the mine. It is at a depth of about 130 feet, and gives every indication of being a bonanza, such as ushered the mine into notoriety here a few years ago. Work is steadily progressing on the Santa Rita mines in the way of preparing them for real business in the near future. Dr. Mahone some time since gave Ed Moulton a contract to furnish 25,000 feet of lumber for timbering purposes, and the order has been lately enlarged upon and the work of timbering and treating the mine of water is now going on under the watchful eye of Dr. Mahone, assisted by Mr. Metcalf of Boston. The amount of ore the Santa Rita and Hanover mines are capable of turning out would make things hum in this section if they were worked to their full capacity. M. W. Bremen, general manager of the Bremen Co., has adopted the lease system and has already made several contracts with miners. His lease provides that in case the men fail to make \$3 per day, they pay no royalty. A large number of men could find room in the mine on fairly good ground. One leaser recently shipped several tons of ore which run 145 ounces per ton. The men working on day's pay are taking out good ore. Day and night shifts are working in one part of the mine. New ground is being opened up and altogether the prospects are the most favorable.

OREGON.

PLACER CLAIMS PURCHASED.—Bedrock Democrat, Nov. 1: The placer claims of Oscar Benson at Granite creek were recently sold to Mr. L. H. Bowman of Walla Walla. Mr. Bowman arrived here last Sunday on his way to Granite to examine his property and see what was needed to equip them for extensive operations the coming spring. The claims consist of 40 acres of fine gravel banks covered with a ditch of unlimited supply of water, capable of furnishing all the water necessary for the working of these mines and other claims adjacent.

THE RED CLOUD.—The owner of the Red Cloud mine in Granite district, Mr. Ike Klopp, has perfected arrangements whereby extensive development work will progress on the property all the coming winter. The mine has been worked for many years past on a limited scale and gives every indication of being a valuable property.

SPARTA MINES.—Bedrock Democrat, Nov. 1: Jay Guy Lewis, M. E. of Sparta, owner of the Del Moore group of mines and other properties, is on a business trip to this city. He gives a good account of mining operations in his district and predicts a grand future for the camp. The mines will be operated more extensively than ever in the spring, he says, as several Eastern companies are taking hold and will work them on a grand scale. The Del Monte group is showing up fine, with thousands of tons of rich gold ore on the dump awaiting reduction by mill.

THE PANDORA.—C. C. McCoy arrived from Walla Walla last Sunday on his way to Huntington to inspect the Pandora mining property, in which he is one of the principal owners. The property is situated about one mile from Huntington and about the same distance from the railroad track of the Oregon Short Line. The working management of the property is in the hands of Judge Lehman. Development work on the Pandora property has been pushed vigorously all of the past summer, until at the present time we understand the ore chutes and veins show up splendidly, and besides having hundreds of tons of rich free-gold ore on the dump, a much larger body of ore is to be seen in the tunnels.

WASHINGTON.

CLE-ELUM'S BIG BORE.—Evensburg Capital, Oct. 27: The hole at Cle-elum has attained a depth of nearly 700 feet, and has revealed quite a number of the hidden treasures of Mother Earth. Besides the seven-foot vein of superior coal, it has uncovered a large bed of superior potter's and fire clay which can be utilized in the manufacture of fire-brick and pottery. The demand for the former will be very great when the furnaces and smelters contemplated in Kittitas valley are built and in active operation. Billy Price returned from a 10-days' trip to the mines. He stated to a reporter that the camps were in the best spirits. Several capitalists were there. The superintendent of the Arlington is making preparations to work all winter and has a large force of men. The War Eagle and others are all busy. The Flannagan Bros. have a shaft down 300 feet and have found two feet of the choicest gold yet discovered. It is reported that they have sold one-fourth interest to San Francisco parties for \$20,000.

PLACER MINING NEAR THE METHOW.—At the mouth of the Methow parties are engaged in placer mining on a big scale. The water of the Methow is flumed down the Columbia some distance and with it the bars of the Columbia are being washed, the help employed being mostly Chinese. In fact, all along the Columbia can be seen Chinese washing out shallow places.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

New Almaden Quicksilver.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Nov. 8, 1888.

Business the past week was very dull, but not more so than was to have been expected at the close of one of the most exciting elections witnessed for several years. Now that it is of the "by-gones," trade is beginning to drift into its usual channels. The money market continues to work easy, although in some quarters there is quite a demand for funds, particularly from dealers in mining stocks. The disbursements in this State for wheat, barley, fruits, hops, wool, etc., since July 1st of this year, are estimated to aggregate over \$30,000,000, which will be increased by the close of this year to fully \$40,000,000. This large sum is gradually finding its way back into the money centers in this State, with, as usual, the bulk coming in this city. Unless there is a large speculative movement in mining stocks, money will soon be quite easy, easier than for over two years.

SILVER—In the local market silver has manifested a strong tone, with an advance obtainable at the close in sympathy with higher quotations coming through from London. A sale was being negotiated yesterday, but at this writing we are not advised if it was closed or not. News from the various mining districts is closely scanned, particularly from the Comstocks, owing to the large preparation made to crush more ore this winter than ever before. Very important work, crosscutting, is to be inaugurated soon in the following mines: Seg. Belcher, Crown Point, Belcher, Alpha, Exchequer and Con. Imperial. In all these, particularly in Alpha and Exchequer, it is confidently asserted that good bodies of paying ore will be uncovered, of which the percentage in silver will be quite small. If the work in the other mines uncover ore bearing nearly all gold, then the silver output of the mines will not be greatly increased over that of the last season, or when water was available to run the mills. The Nevada mill, 60 stamps, is about ready to start up with electric motor. The ore it will run on is quite a percentage of silver. London cables came through to-day quoting silver at 43 1/2, while New York telegrams reported 94c. In our market, sales were made for shipment by the last steamship for China at 93 1/2 to 94c. At the close the market is quiet but firm at 93 1/2 to 94c. The shipments of silver by sea from this port last month aggregated \$416,000 in silver bars. For the first ten months of the year they aggregated \$8,348,400 against \$6,713,715 for the like time in 1887.

QUICKSILVER—The market is without any particular change to report. The demand is good.

LEAD—The unsettled market at the East and also abroad causes our market to waver and unsatisfactory to the selling interest. Buyers only operate in a hand-to-mouth way.

COPPER—Among the better informed, there is a growing impression that the situation is far from satisfactory, notwithstanding rumors of new syndicate deals in Europe. On October 20th, the Calumet & Hecla's stamp mill got out 83 tons of mineral for the 24 hours ending that day. This is the largest output on record. Eighty-three tons of mineral figure at fully 123,000 lbs. of fine copper.

TIN—The European market for pig is still under speculative influences. Our market is very strong, although buyers do not appear disposed to anticipate wants to any extent. For tin plate the spot market is dull but firm, owing to prices being relatively below the cost of importation. For parcels to arrive or for prompt shipment, there is still a good trade doing at full prices.

IRON—The market is strong for all kinds. The high freight rates from England make it difficult to meet buyers' views for forward delivery. The consumption is only fair for the season of the year.

COAL—The imports into this port in October were as follows in tons: Australia, 18,032; Great Britain, 900; Eastern, 5100; British Columbia, 30,738; Seattle, 26,052; Tacoma, 22,755; other mines, 7803; total, 111,222 tons. The market is very strong, particularly for Australian and English; the former, owing to the strike, and the latter owing to the high rates of freight from England to this port. The output of coast coal is steadily increasing.

Eastern Metal Markets.

By Telegraph

NEW YORK, Nov. 8, 1888.—The following are the closing prices the past week:

	Silver in London	Silver in New York	Copper	Lead	Tin
Thursday	43	93 1/2	\$17 30	\$3 92 1/2	\$22 70
Friday	43	93 1/2	17 25	3 72 1/2	22 00
Saturday	43	93 1/2	17 25	3 72 1/2	22 00
Sunday	43	93 1/2	17 30	3 67 1/2	22 70
Tuesday	43 1/2	94	17 50	3 72 1/2	22 70
Wednesday	43 1/2	94	17 50	3 72 1/2	22 70

The market closed as follows: Manufacturers pay the late advance in borax readily. California refined is quoted at 8 1/2 to 8 3/4; concentrated, 8 to 8 1/2. Quicksilver is dull at 65 for the extreme price, though the supply is not large. Lake ingot copper is quiet at \$17.45. November and spot \$17.50. Calumet and Hecla reports its output at 390 tons, which is the largest record for a single month. Pig lead is selling at \$3.77 1/2, with a rather more settled feeling. Refined petroleum in barrels is quoted at 7 1/2 cts, in plain cases at 9 1/2 cts.

By Mail

The following is the latest from the "New York Metal Exchange Market Report":

TIN—Alone has exhibited a fair degree of life under the circumstances, with considerable irregularity in price, the foreign market having been spasmodically quite active. There has not been sufficient interest, however, to culminate in actual business, so tons being the "grand" total of sales for the week. Values have tended toward the establishment of uniformity between the several options; an easing off of a quarter cent on spot, and simultaneous appreciation

of 5 and 15 points on futures, having brought prices nearly to a level for the whole list.

COPPER—Sales of 50,000 pounds were reported early in the week, but apart from this the metal has been almost ignored; and nominal prices have remained practically unchanged since last Saturday.

LEAD—So long the center of speculative attention, is still the article most freely dealt in, but almost all the dealing has been for the liquidation of contracts; 2055 tons having been sold for this account, and only 228 tons in the regular way. The natural effect has been to weaken prices, which stood up fairly well, however, under the first pressure; giving way less than 10 points until toward the end of the week, when they sagged off about 20 points more, although moderately steady in tone.

SPELTER—Has been lost sight of completely in the excitement except to the extent of sympathizing with a decline of about 20 points in nominal values.

PIG IRON—There is absolutely no change in this department, consumers' requirements calling for everything that the furnaces can turn out. There is some inquiry from large consumers, but it has not been found possible to close business, as buyers are not willing to pay full quoted rates, nor are sellers willing to accept the bids which are being made. The consequence is a "hand-to-mouth" trade, until such times as either buyer or seller will yield their point.

Prices generally ruling for metals not regularly dealt in on Call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, @—; Billiton Tin, @—; Banca Tin, @—; Baltimore Copper, \$16.00 @—; Orford Copper, \$16.00 @ 16.25; P. S. C. Copper, @—; Foreign Lead, \$5.00 @ 5.25; Foreign Spelter, \$5.40 @ 5.50; Antimony, \$9.75 @ 13.50.

Mining Share Market.

The excitement of the election has distracted attention from mining stocks during the past week, and the market is without special interest. The stockholders and officers of the Confidence mine are engaged in a little row over a refusal to show the books. It is said that the affairs of the mine have been conducted of late rather in the interest of stock-johning than of stockholders. The dissatisfied stockholders are to meet and discuss the matter.

The following mining companies have cash on hand according to the monthly statements placed on file: Alpha, \$3169.89; Alta, \$26, 913 65; Andes, \$2003.79; Belcher, \$26,014.81; Belle Isle, \$771.52; Best and Belcher, \$951.72; Bodie, \$38,222.15; Bullion, \$45,146.64; Bulwer, \$13,137.35; Caledonia, \$570.94; Con. California and Virginia, \$114,461.45; and unsold bullion valued at \$77,884.32, with further shipments to arrive; Confidence, \$31,768.88; Con. Imperial, \$1633.89; Crocker, \$6627.25; Diana, \$4815.85; Dudley, \$383.16; Exchequer, \$19,339.05; Fund Treasner, \$360.19; Hale and Norcross, \$3414.83; 30; Holmes, \$820.11; Independence, \$3414.91; Julia, \$503.08; Locomotive, \$3668.12; Lady Washington, \$25,218.67; Mexican, \$17,594.18; Mono, \$24,227.75; Occidental, \$1055.90; Ohir, \$35,475.33; Overman, \$193.46; Pondera, \$290.52; Scorpion, \$3547.70; Sierra Nevada, \$2686.40; Syndicate, \$9404.43; Standard, \$16,620.34; Summit, \$9308; Tioza, \$1480.87; Union, \$7146.59; Utah, \$965.89; Weldon, \$2940.90.

The following companies have an indebtedness: Benton, \$25,000; Challenge, \$3604.43; Chollar, \$39,871.61; Commonwealth, \$28,144.58; Crown Point, \$25,352.02; Del Monte, \$15,172.41; Grand Prize, \$42,787.06; Gould and Curry, \$8032.44; Navajo, \$15,487.50; N. Nevada, \$27,409.52; North Belle Isle, \$51,160.81; North Commonwealth, \$22,006.78; Peer, \$4858.48; Peerless, \$4325.34; Potosi, \$42,637.51; Savage, \$79,775.18; Seg. Belcher, \$20,910.79; Tuscarora Con., \$411.20.

THERE is a society of women in Roseburg, Oregon, whose business it is to attend to the driving down of all nails that stick up from the sidewalks.

Four corporations were organized last week to build cable railroad in Seattle.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

CALIFORNIA G. M. Co., Nov. 1. Location, Columbia district, Tnolunne Co. Capital stock, \$10,000,000. Directors—H. C. Partridge, C. A. Warren, James Tohin, W. P. Keyes and E. F. Russell.

HANLEY-DAWSON Co., Nov. 1. Object, to deal in hardwood lumber. Capital stock, \$100,000. Directors—James Clyne, Edmund Dawson, James Hanley, W. C. Hanley and Geo. H. Mayhew.

SUPREME LODGE, ORDER OF GOLDEN SHORE, Nov. 1. This is a social and benevolent incorporation. Directors—H. W. Mathews, W. W. Watson, John D. Hartley, W. A. Newell, H. N. Kerman, R. W. King, A. Rothenstein, N. C. Barea, J. B. McMurray, A. McCasp and Louis Meyer.

DODGE PRINTING Co., Nov. 1. Capital stock, \$25,000. Directors—Z. U. Dodge, J. S. Dodge, H. Mosebach, R. B. McPherson, J. H. Pierce, C. Krass and W. F. Gibson.

BUILDING ASSOCIATION OF TURN VEREIN VORWAERTS, Nov. 1. Capital stock, \$50,000. Directors—F. Wienhol, F. C. Kauffuss, T. F. Obermeyer, M. Meyer, L. Thoenes, D. Salfeld and Gustav Liebold.

MINERAL KING M. & M. Co., Nov. 5. Location, Arizona. Capital stock, \$1,000,000. Directors—Albert Struckman, W. F. Perry, P. A. Wagner, J. W. Tripp and L. Grothwell.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Eureka Con., Nov. 3, \$27,000; Butte and Boston M. Co., 2, \$21,072; Con. California and Virginia, 3, \$102,000; Savage, 3, \$7000; Candelaria (Mexico) for S. ptember, \$116,000; Hanauer, Oct. 31, \$3900; Crescent, 31, \$14600; Hanauer, Nov. 1, \$2200; Germania, 2, \$1767; Hanauer, 2, \$2100; Crescent, 3, \$4700; Hanauer, 3, \$2400; Mt. Diablo, 1, \$7057; Mt. Diablo, 7, \$6997; Con. Cal. and Virginia, 7, \$84,300.

The California Traction Company.

Has, by a recently patented invention, solved the problem of the application of steam to ordinary wagon-roads. Road engines have heretofore been unwieldy and impracticable on account of the immense weight, size and power required, and the difficulty of steering. Under this patent only one-half the power, weight and size heretofore used is necessary to do the work. It makes the application of steam to wagon-roads not only practicable, but cheaper and more expeditious than horses. The Company is now prepared to furnish road locomotives or traction engines for the following purposes:

For hauling heavy loads over ordinary roads.

Steam motive power for suburban street-cars, with or without rails.

Swift motor with car for passenger traffic to be operated with or without track on ocean beach or country roads.

A combined steam harvester, after this principle, will be put on the market next season.

The principles of construction embodied are peculiar to these machines and involve an ease and economy of operation and simplicity and power heretofore unattainable in road engines.

Estimates of plants furnished where conditions of service are stated. Address Call Station, No. 209 Front St., San Francisco.

S. D. Ingram, President; T. D. Hoskins, Manager; A. E. Shattuck, Sec'y.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING OCT. 31, 1888

392,999 — PIN-RAIL ATTACHMENT FOR SHIPS — Philip Brown, S. F.

392,114 — ELECTRICAL DISTRIBUTION — Geo. B. Fraley, S. F.

392,120 — PROSPECTING DREDGE — John Hatch, S. F.

391,991 — CANE AND STOOL — W. Leisner, Los Angeles, Cal.

392,049 — PRUNING SHEARS — C. Meyerholz, Santa Clara, Cal.

392,057 — TRAVELING THRASHER — Murray & Williams, Roseville, Cal.

5,725 — LAB-L — E. W. Joy Co., S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PIN-RAIL ATTACHMENT FOR SHIPS.—Philip Brown, S. F. No. 392,999. Dated Oct. 30, 1888. This is an adjustable helaying pin attachment for the pin-rails of vessels. It consists of a casting having a channel made in one side to fit upon the pin-rail, and vertical projections extending above and below the casting for the purpose of "helaying" or fastening a rope, and, in combination with this, of set screws by which the device is locked upon the rail at any desired point without reference to any holes or perforations within.

TRAVELING THRASHER.—Wm. H. Murray and G. O. Williams, Roseville, Placer county. No. 392,057. Dated Oct. 30, 1888. This improved thrashing machine is designed to travel about the field and receive the grain and straw directly from the header which travels independently by its side, said machine being adapted to thrash, clean and sack the grain at a single operation. In constructing their apparatus the inventors have employed what is known as the "Standard thrashing machine," having vibrating sections behind the thrashing cylinder, by the vibrations of which the straw and grain are carried backward and gradually separated from each other, so that the straw may escape at the rear of the machine and the grain be directed to the cleaning chute. The patent covers several improvements in detail. The main features are "in a thrashing and separating machine, the construction of the machine casing, the cylinder and concave, the straw-carrier, and the endless belt, the upper portion of which serves to feed the grain to the cylinder and the lower portion forms the top of the space over the straw-carrier and assists the travel of the straw over it."

APPARATUS FOR ELECTRICAL DISTRIBUTION.—George B. Fraley, S. F. No. 392,114. Dated Oct. 30, 1888. This invention relates to certain improvements in electric lighting and apparatus connected therewith, by the use of which the inventor is enabled to convert a continuous, direct, high-tension electric current into an alternating current at any point or points on the line, for the purpose of using the same for incandescent lights without diminishing or interfering with the high-tension current, or its use in the ordinary arc lights, or for other purposes. The dynamo may be of any of the well-known forms of construction for producing a continuous high-tension electric current, with wires for any length of current, and at any points within this circuit where it may be desired, the ordinary high tension arc light may be introduced and used. At any other points where it may be desired to use an alternating current for incandescent lighting, it is done by the introduction of a commutator and current reverser, and a converter through which the current is transmitted so as to produce the necessary secondary current for the use of the incandescent lights. The operation of the machine reverses the current through the converter, and as the commutator rotates, the alternate reversal of the current takes place backward and forward through the converter, and any number of changes or reversals per minute may be obtained by changing the speed of rotation of the commutator. By the peculiar construction and operation of this device, incandescent lighting may be effected from a series circuit, and the continuous high-tension current or currents may be converted into an alternating current or currents, this conversion taking place either at the station or anywhere along the line of the series circuit or circuits, and the incandescent lights can thus be operated at any distance away from the station and at any point within the circuit.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

ENLARGED!

RAND, McNALLY & CO.'S BUSINESS ATLAS.

1889.

WILL BE DOUBLE THE SIZE OF
ANY OTHER ATLAS
PUBLISHED.

New Size of Page, 15x21 Inches.

It will contain new large scale maps occupying two pages only (no cut-up maps) of all the important States. The entire arrangement will be new, embodying the most improved methods of reference and indexing, clearly showing the location, population and commercial advantages of over 200,000 towns in the United States, Canada and Mexico.

RAND, McNALLY & CO.,

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF
ANY WHEEL IN THE WORLD.

And is everywhere recognized as the standard for high-pressure service.

UPWARDS OF 600 IN USE.

From 12 to 20 per cent better results guaranteed than can be produced from any other wheel in the country. It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRICAL TRANSMISSION.

Power from these wheels can be transmitted by electricity long distances with small loss, and made available for running Mills, Pumping and Hoisting Works, Trams, Electric Lights, etc. Address

American Rock Drilling Machinery

For Mines, Tunnels, Quarries, Sewers, Grading, etc.

RAND DRILL CO.,

23 PARK PLACE, NEW YORK.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

PORTABLE and DURABLE.

WEIGHT, 4 TONS.

It is a Full Fledged Quartz Mill without Gearings, Cogs or Pulleys.

Power applied direct. Works Ore at Low Cost. More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low grade ore on account of low cost of working.

Any infringement on this Patent will be prosecuted to the full extent of the law.

WM. GUTENBERGER, Sacramento Foundry, corner N and Front Sts., Sacramento.

Room 7, No. 109 California Street, SAN FRANCISCO, CAL.**

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

**JOSHUA HENDY MACHINE WORKS,

The Victor Concentrator.

The Victor Concentrator, which is illustrated on this page, was invented by S. W. Shaw of this city, and has been so modified and improved as the result of practical work in the past two years, that, having passed the experimental stage, it is now offered to the mining public. Its operation is unlike any other machine of its class, its motion being like that of the original of gold separators—the batea—worked by suitable mechanism so that the process of separation and concentration is automatic and complete.

The table is of concave disk-shape precisely like an enlarged batea. This rests on vibrating rods, and an eccentric and gearing give motion to it. To the edge of the table is a downwardly projecting lip or flange to prevent the water dripping off underneath on to the gearing.

A hole or opening is made in the center of the table, where is placed a small removable screen. Water comes from a stop-cock above down into the cup, and this supply is subject to regulation in proportion to the sulphurets in the ore.

The pulp to be concentrated passes from the batteries into the pan or receiver shown above the stirrers. This receiver is perforated, the holes being punched from above, so there are hurrns on the lower side in order that every stream falls separately on the table. This carries all the falling light stuff below the surface of the material already on the table. It becomes involved with the coarser sand and keeps on down to the bottom.

The batea-like motion imparted to the table causes the heavier portion of the material to come to the center, and the lighter substances—tailings—go off over the outer edge into the large encircling pan, and from there are discharged. Scrapers or rakes revolve slowly and aid in keeping the pulp loose so that the sulphurets can move freely to the bottom.

The concentrated sulphurets pass continuous-

moves from the top all the time instead of moving from the bottom.

As the table is given its vibrating or reciprocating motion, such as is given to a batea and

changed. This device is adapted to save amalgam, quicksilver, floured quicksilver, etc. The shipping weight is less than 1000 pounds. The machines are made to handle the pulp from a

THE VICTOR ORE CONCENTRATOR.

gold-pan, the pulp falls upon it near the center. The worthless portions such as sand and gangue are carried over the periphery of the table into the inclined annular trough, while the heavier

five-stamp battery. At the Gold Bank mine, at Forbestown, Butte county, there are four of these concentrators at work very successfully. The superintendent is very well pleased

Dredging for Gold in Rivers.

Although as yet we have never made any success of dredging for gold in the rivers of California, there are other parts of the world where they are making money at the business. On the Olutha, a large river on the south island of New Zealand, there are seven mining dredgers, all working successfully about eight months of the year. Mr. C. W. Rumble of Chicago has been looking up this subject of river mining with dredgers for the past year and a half, and came to California to experiment on the Feather river near Oroville. Seeing in the MINING AND SCIENTIFIC PRESS some account of work being done in the Australian Colonies, he went over there to personally examine the machinery. On his return here recently, he called on the editor of the PRESS, so as to give the benefit of his experience to its readers.

Mr. Rumble informs us that all the dredging machines which are working successfully on the Olutha river have chain buckets, and most of these are worked by the action of the current of the river on a wheel or wheels placed on the side of the scow. The river runs with a current of about 12 miles an hour. These water-propelled dredgers are run night and day, and work to a depth of about 20 feet.

The machinery only requires the attention of one man on a shift, and they raise and wash about 15 to 20 tons of solid material an hour. All of these dredgers have been running for years steadily. One of these which has been at work constantly for eight years was being rebuilt when our informant was there. This itself shows the operations must have been successful. One of these dredges, of the same pattern except that it is operated by steam, is working at Alexandra, about 200 miles above the mouth of the Olutha. It has greater capacity than those run by water-power.

The dredged material falls into a sort of revolving grizzly to take out the stones and rock, and the earth and sand is washed in blanch-

Plan.

MACHINE FOR DREDGING RIVER BOTTOMS FOR GOLD.

ly in under the central shield or cup, fall through the screen over the central hole and are caught in a suitable receptacle. This screen is changed according to the percentage of materials, more perforations being needed where the sulphurets are abundant. The stream of water which comes in from above is also regulated at will.

The effect of spreading the pulp so widely is to almost destroy any current, and the pulp

and valuable ore or sulphurets by their greater specific gravity and the peculiar motion imparted to the table, will sink through the agitated and lighter particles of pulp, and work their way centerward to the small screen, and pass through it into a proper receptacle.

The upper receiving-pan, reels, etc., may be raised up to leave the whole top of the table clear, so that the central screen may be readily

with the results accomplished. N. W. Spaulding, 17 and 19 Fremont street, manufactures these concentrators. The machine gained a silver medal for its inventor at the recent Mechanics' Fair in this city.

KEELY, the "motor-man," has been found guilty of contempt of court in not obeying an order to open a sealed package said to contain a description of the Keely motor.

ket sluices, arranged on the scow, or "punt," as they call it in New Zealand. The huckets bring up rocks as large as a man's fist. If they strike large rocks or obstructions, they stop, because the motive-power is not enough to break them. The huckets of the ordinary dredges are about 12 inches deep and 12 inches wide, rounded at the corners. The scows draw about 12 to 15 inches of water. The general

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

The Mines of Utah.

[Written for the Press.]

Utah is exceedingly rich in undeveloped resources. At the time of the early settlement of the country by the Mormons, nothing was known of the mineral deposits that are now being worked to such great advantage. The "latter-day saints" were then, as now, purely a pastoral people. Brigham Young considered it dangerous to Mormon institutions to permit his people to become infatuated with the less certain pursuit of mining after the fact was established that the country abounded in rich minerals. His policy was to keep it dark, "for," said he, "when the extent and richness of the mines become well known, the gentiles will flock here and possess the country." His idea was to develop the agricultural resources, claiming, with much propriety, that the mines would keep. Viewed from a Mormon standpoint, Brigham was correct in all particulars, but State or Territorial lines formed no barrier to the indomitable prospector who eventually found his way hither, demonstrating beyond peradventure the fact of the existence of immensely rich auriferous deposits which thereafter allured capitalists to commence the development of the same. Though extensive mining operations are of comparatively recent origin, they are already, it is asserted, a source of much greater income to the country than the pursuit of agriculture. And there are the best of reasons for believing that the mining industry will maintain its supremacy over that of every other for an indefinite period. A recent visit to some of the

Prominent Mining Districts

Of Utah by the writer furnished him satisfactory proof that the country provides a better field for the prospector and for the investment of capital than any other mining section of the great West. This conclusion was arrived at only after careful investigation. One thing that has retarded development has been the lack of capital. There is not the least doubt but that if the same prospects could be shown in California and elsewhere that are to be seen in Utah there would be an abundance of capital immediately forthcoming to open up and operate the mines. It is hard to account for the apathy manifested by capitalists with reference to the splendid opportunities offered in Utah; for, while it is true that some gigantic swindles have been perpetrated upon them by heartless mining sharps, there are a number of the best paying mining properties on the Pacific Slope; and I personally investigated mines in various stages of development, as well as some late discoveries (most of which are lying idle for want of capital to work them), that are known to prospect as well, if not better, than the famous Ontario mine at Park City. So much by way of an introduction. I will now endeavor to lay before your readers a few observations on the several mines of Brigham and Park City, the most thriving camps of the Territory.

For a small mine there is perhaps no better paying property in the Territory than the Nast mine, owned by Messrs. Watson, Stanchfield and Chandler, and superintended by C. W. Watson. Through the courtesy of Chas. Mayberry, foreman, accompanied by A. J. Stanchfield, I was shown through the mine. The entire force required to operate it is but 12 men, and the output is 90 tons per month. The assay value of the ore is 50 per cent lead, 25 ounces silver and from \$5 to \$8 gold per ton. Owing to a slight advance in lead recently, the owners realized 100 per cent on operating expenses for the month of September.

The Winnemuck M. & M. Co.'s mine is now working on the 300 foot level. The ore assays well. A two-foot ledge has been struck, which assays 41.60 per cent lead and 501.65 100 ounces silver. The company employs 30 men to operate it.

The Bingham Mining Company started up again the latter part of September with new machinery. The mill has five new Huntington pans and Hazelton boiler, and the capacity is 180 tons daily. The mill works 100 tons per day at present, with only four men. The manager, E. D. Egan, is willing to wager that the company has the largest body of low-grade ore on the Pacific Slope. The width of the ledge is over 200 feet and the depth has not been ascertained. The mine is but a few hundred feet west of the Nast and assays \$7 per ton gold. Mr. Egan is also superintendent of the Yosemite No. 2, which is now being operated on but half time because of the lack of water. I am indebted to J. T. Harrington, foreman, for courtesies during my visit. This is a very extensive and profitable mine, lead being traced for more than 4000 feet, and the average assay value of the ore is reckoned at 50 per cent lead, 10 ounces silver, and \$1 per ton gold. The company gives employment to 40 men around the mine.

The Brooklyn lead mine, formerly owned by a New York company, has, I believe, recently changed hands for a good figure. At the time of my visit 100 men were employed in and about the mine. There was over 30,000 tons of 30 per cent ore on the dump awaiting the erection of a concentrator. The daily output is 50 tons, 20 tons of which is first-class. The average

assay of the ore is 60 per cent lead and from 12 to 14 ounces silver. The work is superintended by R. G. Legg. The Jordan M. & M. Co.'s mine looks well. They have recently renewed operations. The marketable ore assays 50 per cent lead, 20 ounces silver and \$8 gold. The company are reconstructing their concentrator; \$2,500,000 worth of mineral has been taken from this mine up to present date.

Park City is noted for possessing one of the best mines, not only of Utah, but of the Pacific Coast—the Ontario mine having paid its owners in dividends since the year 1876 \$9,500,000. The Ontario Company employs 350 men in both the mill and mine. R. C. Chambers is the general superintendent. To Neal Gillis, foreman, I was indebted for favors during my visit to the mine. One feature in connection with the mine especially interested me, that is, the pumping machinery. Four pumps are in position, but only one is worked at the same time. The larger pump throws 360 gallons at a stroke, and makes $7\frac{1}{2}$ strokes per minute, or over 160,000 gallons an hour. The company have expended over a million dollars for machinery to operate the mine. The pumping apparatus is a necessity at present, and will be so until the drain tunnel is completed. The Ontario drain tunnel was recently started. Its length will be about three miles and it is calculated to drain the Ontario and Daly mines. Its exact cost cannot be ascertained, but it will doubtless cost several hundred thousand dollars. Thirty men will be employed to construct it—all that can be worked to advantage, and it is estimated that it will require three years to complete it.

The Ontario mill runs two rock-crushers and 40 stamps for ore and 10 for salt. From 12 to 20 per cent of the latter is used for roasting. It has 24 amalgam pans, 12 settlers and 6 retorts. The ore floor is 80x90 feet and 14 feet high. The engine is a 250-horse power.

The Daly mine is running steadily with an average output of 100 tons daily. The shaft is now 843 feet. The drain tunnel, connecting with the Ontario on the 600 foot level, is three-quarters of a mile long. The machine-shops are most complete, doing all the work necessary, except casting and constructing the heavy machinery. A six-foot Pelton wheel is used, and water-power is obtained from the Ontario mine. The mill is a 30 stamp, and employs on an average 60 men in its operation, crushing 80 tons per day. The milling ore assays from \$40 to \$50; the shipping, 20 per cent lead and 100 ounces silver. The wages paid by the company for 12 hours range from \$2.50 to \$4. A new building has just been constructed for leaching.

The Massachusetts mine, originally known as the Empire, is now doing development work and has just reached the 600-foot level, and has commenced to drift, but is shipping no ore as yet.

The Anchor Mining Company owns more ground than the Ontario. A tunnel is in course of construction, which, when completed, will be over $1\frac{1}{2}$ miles in length. It is expected to have it finished by March next. I was informed by John McSorley, who has the important work in charge, that as high as 117 feet was made in a single week. At the altitude of the mine, about 8000 feet, snow sometimes falls to considerable depth, and the consequent snow-slides are often a serious hindrance to mining operations here. The men had a narrow escape from a slide last winter. The hoarding house was without a moment's warning entirely overwhelmed, several of the boys barely getting away with their lives. The tunnel has now reached about 5000 feet.

The most lofty mine in the Park City district is the Crescent, five miles from town. Its altitude is 9500 feet and it is reached by a tramway which cost the company \$45,000, built four years ago. The ascent from the town is about 500 feet per mile. All the ore is shipped down the tramway to the concentrator located at the depot, thence, when through with operation, to Omaha. The average assay of the ore is 30 ounces in silver.

The Disappointment, owned by Messrs. Duffy, Richardson & Hirschman, is located just west of the Crescent. Two shafts 90 feet each have already been sunk, and a tunnel 500 feet has been made. Ore is now being taken out which assays 60 per cent in silver and lead, and \$7 in gold. The proprietors recently took out 14 tons from one lead in a week and realized from the same the snug sum of \$700. The Gem, an adjoining claim, together with the Disappointment, have been bonded for \$18,000.

The Creole mine, adjoining town on the west, was patented by the proprietors, Messrs. Condon & Moore, in '82. Tunnel to cut ledge is 190 feet. Cut the ledge at 158 feet. Drifted on the ledge 140 feet and made three upraises, finding ore all the way. Seven hundred and fifty feet east from Discovery the ore is continuous. There is a five-foot body of ore at the incline shaft. All prospecting or deadwork is now completed, thousands of tons of second-class ore being in sight. The proprietors some time ago shipped 200 tons of ore, which yielded 20 ounces silver, 30 per cent lead and \$4.50 in gold. The location of this mine is one of the most convenient in the camp, and it is well provided with timber growing on the premises. It is the prediction that, had the owners of this mine the available capital to push the work forward, it would hold rank with some of the better mines of the camp. It certainly is worthy the investigation of capitalists seeking profitable investment.

The West Ontario, known as the Farrish and McLaughlin group, located 400 feet west of the

end lines of the Daly mine, has an excellent name in the camp. From rock taken on the 200-foot level, an assay placed the value at \$260 per ton, and the vein proper is three feet solid ore. The mine embraces three lengths and enough space in breadth to make up the 20 patented claims comprising the group. The owners so far have done little except development work, but expect to push ahead with a good force soon. They use a whim horse, and so far have brought their ore to Park City sampling-mills. It is claimed that the mine promises as well as the best ever did in Park City at present stage of development. It can hardly be denied that there is something in luck, especially when it comes to mining. Such reflections are forced upon us when the history of the Woodside mine of Park City is reviewed. The owner, E. P. Ferry, has for some years been in the habit of leasing the mine out, and for a time it was on the list of the condemned. A large sum had been expended in its development, but without commensurate success. Finally, during the latter part of September last, two miners, Drake and Williams, happened to be passing over the claim, and sat down to rest. They began carelessly examining some croppings. To their astonishment, the float proved very rich, as they were qualified to determine, whereupon they proceeded at once to secure a lease and commenced the work of development. The ore pays handsomely from the surface, thus enabling the proprietors to employ all the men that can be worked to advantage, and pay them from the immediate proceeds of the mine. The ore assays 50 per cent lead, 50 ounces silver and about \$2.50 gold. These worthy miners certainly have a bonanza. F. B. L.

The Lixiviation of Silver Ores with Hyposulphite Solutions.

EDITORS PRESS:—C. A. Stetefeldt, M. E., has written and published a book with the above title, which professes to be an exposition of the theory and practice of silver leaching. The practical part consists of a digest of Russell's experiments and a compilation from Daggett's practical pamphlet on the Russell process. The theoretical portion is partly compiled from various chemical books and partly original. It is with the latter portion that I propose to deal in this article. As the author has not spared Daggett in the matter of some unimportant chemical errors in that gentleman's excellent paper, which does not claim to be scientific, he cannot complain if his own statements are made the subject of criticism. He claims that the chemistry of leaching silver ores now rests on a sound basis (*sic*). If he will say a basis of sound, I will agree.

In one of the author's earlier papers on the Russell process, he advanced a theory of the precipitation of silver by a polysulphide from a hypo solution, which I could by no means accept as true. This theory called for the formation of sodium sulphate, whereas no sodium sulphate is produced in the reaction, as I have proved. I investigated the subject by experiment, and came to the conclusion that the reaction produces sodium polythionate, almost certainly tetrathionate, and that, reacting secondarily on sodium polysulphide, reproduces the hypo. This was fully set forth in two articles which appeared in the *Eng. and Mining Journal* of Nov. 19th and 26th, 1885.

Nevertheless, perhaps rather the more, Mr. Stetefeldt reaffirms his absurd theory in his new book, not noticing my articles, unless the following discourteous, not to say insolent, passage from page 79 is to be considered as referring thereto: "An obscure critic has taken me to task for advancing this theory in my first paper on the Russell process, because, he says, not a trace of sulphuretted hydrogen is evolved in the reaction. Evidently his classical education is at fault in not comprehending the meaning of 'in statu nascendi.'"

It is true I did not make the above statement; my argument was based on much wider grounds and deeper withal, but I am the only one who publicly challenged his views. I did not take him to task. I simply showed that his theory was wrong and offered a better one, which explains all of the facts observed in practice, of some of which Mr. Stetefeldt was evidently ignorant. It also accounts for all of the phenomena developed in the laboratory in this connection, including Russell's high coefficients of precipitation and his low ones, the free sulphur in the precipitate, even though pure Na_2S_2 he used as precipitant, and the very significant fact that if a solution of silver in hypo is treated with successive portions of a polysulphide solution, the precipitate being collected and determined for each, it is found that the coefficient of precipitation diminishes progressively, due to the relatively increasing effect of the tetrathionate in consuming the sulphide as the proportion of metal becomes less in the liquid; and that other significant fact, noticed in practical work long before, but not then understood, that after all silver or other metal is down the liquid can still decompose a considerable quantity of the polysulphide, which is due to residual tetrathionate.

On page 78 the author has discussed (without credit) the first half of my theory, that which explains a high coefficient of precipitation and the production of tetrathionate, and rejects it on grounds which a consideration of the secondary reaction, the decomposition of the tetra-

thionate of polysulphide, completely invalidates. My theory is:

Though the second equation, as a fact *per se*, was known to some chemists before, the first is mine, as is also the complete theory. It must, therefore, he supposed that Mr. Stetefeldt, while lacking candor to acknowledge it, derived the idea of the first equation from my article. But at that time the author did not believe in the reaction expressed by the second equation, and did not even take the trouble to test it, as he could easily have done; hence he occupies the false position of having examined and criticised the half of a chemical proposition. Is this scientific? He believes in that reaction now, however, having dug it up in Graham's Chemistry; but his previous willful ignorance has resulted in the falsification of a large part of his theory of leaching, as set forth in this book.

It is not, however, that Mr. Stetefeldt has yet come over to my view as to the theory of precipitation; that he must do so I have little doubt, but as he will not be able to dig that out of any book, nor probably willing to accept instruction from so obscure a person as myself, we must give him time for "rediscovery by scientific research," as he has himself told us he rediscovered a fact which had been known to every Mexican *azoguero* over a hundred years before, and was also known to most "muscular amalgamators," the scientific research in that instance consisting in some experiments in something like a frying-pan or other domestic utensil.

But he has admitted, in a recent supplement to his book, that the tetrathionate formed in making extra solution is regenerated in the precipitating-tanks, and therefore that his assertion, on page 136, that any such assumption is "absolutely false," must be retracted, and that his naive wonder at the small loss of sodium thiosulphate at the Yedras mill, where they use ten pounds of bluestone to the ton of ore for making extra solution, and therefore ought to lose, at least, as much thiosulphate, according to the book, was foolishness. Verily, pride goeth before a fall! Mr. Stetefeldt might have learned all that and more from my articles, but he would not. This timely retraction forestalls an article which I had prepared on the point; unfortunately, it did not come in time to forestall a set of experiments which I made to prove that I was right.

To return to the author's theory of precipitation, his equation calls for not only sodium sulphate, which is not formed, but also for the production of sulphur dioxide. Now, almost any chemist knows that sulphur dioxide, in presence of aqueous polysulphide, forms thiosulphate; but this expounder, finding or alleging an approximate agreement between Russell's experimental coefficient of precipitation and his own equation, neglecting the sulphur dioxide, first cites the alleged fact in support of his theory (up to the point at which the effect of SO_2 claims consideration), and then, finding that the effect of the SO_2 would reduce his coefficient so much as to destroy that agreement, again cites the fact to prove that SO_2 does not react as it *must* do if present. I suggest, though assured that no suggestion of mine will be accepted by this self-sufficient author, even though it were the purest truth that ever gemmed the crown of science, that he adopt the view, quite usual among chemists, that SO_2 , in presence of water, forms H_2SO_3 . This will give him a chance to dispose of the inconvenient SO_2 with formation of H_2S , thus: $\text{H}_2\text{SO}_3 + \text{Na}_2\text{S}_2 = \text{Na}_2\text{S}_2\text{O}_3 + \text{H}_2\text{S}$, the latter, *in statu nascendi*, precipitating silver. This, if not true, is as true as his theory, and good enough to finish it out with.

Russell has found that the presence of caustic soda in the hypo is injurious. Ores containing calcite are liable to contain caustic lime after the roasting, and this reacts on the hypo, forming caustic soda. On pages 163-4 the author says, referring to this matter: "But if the extra solution is applied at once, the cuprous hyposulphite neutralizes and counteracts the deleterious effects of the caustic lime." Now caustic lime could only precipitate cuprous oxide from extra solution, but cuprous oxide is soluble in the hypo, and if precipitated for the moment by the lime in temporary excess, must be redissolved almost instantly. Can it be dissolved without rendering the hypo caustic? I say not, and the author's theory of this application of extra solution seems unsound. That the practice may also be unsound is suggested by the fact that, "before the extra solution follows the first wash-water, it has been found beneficial to impregnate the (alkaline) ore with a small quantity of a strong copper sulphate solution." In this case, the caustic lime precipitates cupric hydroxide which is not soluble in hypo, hence the desired result is attained.

On page 79 is the following statement: "The sulphuretted hydrogen evolved in precipitating polysulphides on the large scale, is principally due to the presence of acid salts in the lixiviation solution." This must, in candor or in charity, be understood to mean, after the metals are all precipitated, and in case an excess of polysulphide is used, else it would be simply stupid. But what acid salts can be present after the washing of the ore, and after addition of the precipitants? Daggett says something about H_2S being evolved when an excess of polysulphide is used, but that must be due to spontaneous decomposition of the excess, not to acid salts. I am not afraid to indorse the statement

attributed to "Obscure Critic," that "not a trace of H_2S is evolved in the reaction," for, even though acid sulphites, or free SO_2 may be present in the solution of sulphuric acid, has been added to the hypo, yet these will not cause evolution of H_2S because, as the author himself insists, that substances would precipitate silver in *statu nascendi*, it produced during the operation, but it would not even be produced by acid sulphites.

On page 39, article on decomposition of an acid extra solution, the author says, "After sufficiently long exposure to the atmosphere, the free acid becomes neutralized by Cu (H O)₂," meaning free sulphuric acid, as shown by the context. Granting that a very small quantity of free sulphuric acid may exist in a hypo without decomposing that, whence comes the cupric hydroxide, if, as the author has previously said, "The oxygen absorbed by the cuprous salt is all transferred to the sodium hypsulphite," "so long as free acid is present?"

I understand the meaning to be this: The cuprous salt oxidizes and forms cupric sulphate with the free sulphuric acid; cupric sulphate reacts on sodium thiosulphate, producing sodium tetrathionate and sulphate, and reproducing cuprous thiosulphate, and so the deterioration in hypo progresses without loss of cuprous thiosulphate; but when all of the sulphuric acid has thus been combined to form sodium sulphate, the same reactions go on as in a neutral solution. The meaning may be correct, but the expression is worse than "obscure." But can free sulphuric acid exist in presence of sodium thiosulphate and of the same salt of copper? I think it is very doubtful, for it would seem that the sulphuric acid should at once form sodium sulphate. The argument against this is the non-appearance of free sulphur. May it not be that thiosulphuric acid, though it has never been isolated, may exist in small quantity in the solution without immediate decomposition? This point I cannot decide, and it may be that it is not so; and the reaction may take a shorter course than that I have indicated, leading to the same result, however; my concern is only with the muddled method of the text at present.

On page 44, discussing the use of cuprous chloride for making the extra solution without destruction of sodium thiosulphate, ignorance of the reaction by which that salt is reproduced again appears, and the following peculiar statement occurs: "The extra expense of preparing cuprous chloride would not compensate for the saving in sodium hypsulphite." What is probably meant is, that the extra expense would not be compensated by the saving. This would not be worth notice but that the author, by implication in the obscure critic, prides himself on his classical education, and ought therefore to write good English. The author has suggested, on page 45, that, on account of the fact that each pound of bluestones used in making extra solution destroys a pound of sodium thiosulphate, it might be a good plan, where freight is high, to ship 100 pounds of the ready-made Leuz salt in place of 279 pounds of chemicals for making it at the mill (I believe there is an error in the figures, but have not time to look into that) a very good scheme, which he abandons in a recent supplement on account of his error as to the effect of tetrathionate, forgetting, apparently, that the regeneration of thiosulphate is at the expense of polysulphide.

The remark with which the paragraph concludes, that besides a great saving in freight this stock solution would not be overloaded with foreign salts, remains good, notwithstanding the late discovery. The tetrathionate remains a foreign salt until it has accumulated in the hypo sufficiently to take part in the decomposition of the sulphide, that is a very considerable part, because of the stronger affinity of the metals, as explained in my article of 1885. Then there is the sodium sulphate, also a foreign salt, which is never decomposed. It seems as though Mr. Stetefeldt in his haste to retract an error has perhaps gone too far in condemning his own suggestion.

I could say more, but I have said enough for this occasion. I think the Russell process is a brilliant discovery, and hope Mr. Stetefeldt may shine in its light to his heart's content. Barring the errors in theory, his book is a useful one, though abounding also in numerical errors which are discreditable to either the author or the publisher. But two fatal blunders so pervade and undetermine the ostensibly scientific part that it will never be presentable in a scientific point of view, notwithstanding the patchwork of supplements, until carefully rewritten. Perhaps it would be a good idea for the author to sit down quietly and prepare a new edition for presentation to the purchasers of this, with caution as to despising the intimations of obscure critics.

I will conclude with the remark that a book of this character is not embellished by sneering remarks about the opinions or practice of workers, several of whom are scored by name in the book, nor by insulting, anonymous allusions, of which I note more than one. Criticism which is worth any notice, however obscure its source, sneers not candid and truthful, even if caustic, discussion.

C. H. AARON.

THE land to which Indians are contesting Richard's Gird's title in Southern California is not, as reported, a part of the Chino ranch, the title to which is not questioned.

THE business men of Tacoma, Wash., have organized a relief society to provide support for the indigent during the winter.

California.

Origin of the Name.

[Written for the PRESS by HENRY G. HANKE.]

It is now generally admitted that the name California was derived from a popular romance published in Madrid in the year 1521. It was entitled "Las Sergas del muy esforzado Caballero Esplandian Hijo del Excelente Rey Amadis de Gaula;" in English, "The Exploits of Very Valiant Knight Esplandian, Son of the Excellent King Amadis of Gaul." Chapter 157, containing that portion describing the golden island of California, was published in the original Spanish with English translation, in the Sixth Annual Report of the State Mineralogist of California, folio 8.

Assuming that the supposed golden land was named from the mythical island of the romance of Las Sergas, there may still be a more ancient though indirect origin of the word California.

It may be asked, "Did the word originate with the author, or did he take it from the works of some still older writer?" The latter surmise seems the most likely, and it has been suggested that the name came indirectly from Julius Caesar's wife Calpurnia. In looking up this subject, it is interesting to note that similar names were very common in Roman and Grecian history, not only as individuals, but as families, extending through long periods of time, and it would appear likely that the author of the Spanish romance may have had some of them in mind while writing it.

Calliphon was a renowned painter of Samos, referred to by Pliny.

Calliphon fills a place in history as a well-known dancing master.

Calphurnius, J., was a Greek scholar of the fifth century.

The family Calpurnia were noted office-holders in Rome, and it is related that before the death of Emperor Augustus, 11 of them had been made Consul, while others, in consideration of their war victories, had been honored with triumphs.

Lucius Calphurnius, a Tribune of 149 B. C., gave his valorous son a golden crown weighing 20 pounds.

Calphurnius Titus was a native of Sicily, but little is known of his life except that he was a poet who imitated Virgil. The exact date of his life is not known, but is believed to have been in the reign of Gordon III, about 288. He wrote 11 celebrated eclogues, which were first printed in 1471, 50 years before Las Sergas appeared.

Calpurnia, spelled also Calpurnia, was the daughter of L. Pius of a renowned family of Rome, and a branch of the Calphurnians descended from Calphurn, son of Numa Pompilius, second king of Rome. She was Caesar's fourth wife. During the night before the assassination she dreamed the roof had fallen, and that he had been stabbed in her arms. She used her best effort to prevent his leaving the house.

A celebrated law—Calphurnia Lex—was enacted A. U. C. 604. Its object was to punish severely those who gave or received bribes.

Either of these names, so well known in history, may have suggested that given by the author of Las Sergas to the Golden Island and its Queen.

There is a circumstance connected with the early history of California, not generally known, that may be interesting to your readers. As far as we can learn, Captain Melchior Diaz was the first European to set foot on the territory now known as California, and to enter what is now known as San Diego county, where he met with an accident which terminated his life. The events leading to this tragedy were as follows:

Cortez discovered Lower California in 1533, and two years later (1535) examined the coast in person.

In 1539 Vasquez Coronado, Governor of New Galicia, departed for Culiacan in company with three Franciscan Friars. He sent his companions with a negro, Stephen, on a journey of discovery, with orders, if possible, to visit the seven cities of Cibola. The command of this small expedition was given to Marcos de Niza. They penetrated the desert and reached the cities of which they were in search, but the negro, with great arrogance, not only demanded the putative gold, but the women also, upon which the inhabitants killed him, sent back part of his companions, but retained several of the young men as captives. The monks, who had remained at some distance from the town, on learning the result, returned immediately to Culiacan and reported the unfortunate termination of the expedition to Coronado. They also described the country as being rich in gold and well worthy of conquest. Coronado returned to Mexico and caused an excitement, which ultimately led to his famous march.

In April, 1540, a great expedition departed from Culiacan, led by Coronado. At Chiametta he met Captains Melchior Diaz and Saldihar, who, with a small party of mounted men, had explored the desert country as far as Chicilticale (Casa Grande, on the Gila river). The account they gave to Coronado was so discouraging that he was about to abandon the expedition and return to Mexico. The army, however, gaining confidence, continued on, and finally reached the Colorado river, which they named "Vermijo," from the deep red color of its waters. Soon after they arrived at Cibola,

probably the Zuni villages, and were greatly disappointed on finding no gold or anything else of value.

On the 9th day of May, 1540, an expedition by sea, under command of Fernando Aleron, sailed from Natividad in two ships, the St. Peter and the Santa Catherine, to support Coronado and to furnish supplies for his army. The commander had orders to sail along the coast and to be within signal distance of the land. Lower California was then supposed to be an island and the Gulf of California a strait, and it was taken for granted that ships could sail without difficulty for any distance up the coast.

Aleron's ships put into Compostela and Culiacan to learn that Coronado had continued his march beyond. Sailing northward, he found the shores to approach, and finally join, revealing the fact, then first known, that Lower California was a peninsula and not an island. This discovery was forgotten for many years, and California mapped as an island, and called Islas Carolinas, until its connection with the main land was rediscovered by Father Kuhn, 160 years later.

At the foot of the gulf Aleron discovered the Colorado river, which he named "Rio Buena Guja," and on the 26th day of August, 1540, commenced an exploration in two small boats, which he was compelled to haul up with ropes, owing to the force of the current. Not being able to communicate with Coronado, he returned to his ships. On the 14th day of September he renewed the attempt, and reached a point 85 leagues from the mouth, some miles above the present site of Yuma in Arizona; returning to the mouth of the Gila river, he erected a cross, at the foot of which he buried letters for Coronado.

Captain Melchior Diaz led an exploring party of well-mounted men from Sonora. Hoping to meet the vessels on the coast, he traveled northward 450 miles, and also discovered the Colorado river, which he named "Rio del Tizon," from its muddy or dirty appearance. From the Indians, who were generally hostile, he learned that the Spanish boats had been up the river, and, going to the locality given by them, found the cross and letters, which informed him that Aleron, finding that he could not sail farther north in the gulf, had returned to New Spain. Diaz crossed the Colorado river on rafts and continued his explorations into the Colorado desert. As far as the writer can learn, this was the first party of Europeans that ever entered our California. The Spaniards did not penetrate far. Diaz was accidentally killed by falling on his spear, whereupon his command returned to Sonora.

In view of these facts it would be appropriate to name some prominent mountain, lake or county after that bold Spanish explorer and first California prospector.

Idaho Findings.

EDITORS PRESS:—Silver City in Owyhee county, Idaho, is quite elated over some rich strikes lately made in the Poorman, Oro Fino and Owyhee, on War Eagle mountain. The Oro Fino Limited is an English company, and is working a large force. Their mill is being enlarged to a 30-stamp capacity. They have lately run into a large body of ore, the pay streak being about three feet wide. An English company has lately bought the Poorman group of mines, and is cleaning out the Belle Peck tunnel. One million dollars was taken out of the Poorman proper in one month, and it is estimated that this mine has given up six million dollars all told, since its discovery. The Illinois Central, adjoining the Poorman, is being worked and is producing rich ore. The Owyhee, owned by the Shawmut Co. of Boston is showing up handsomely; some extremely rich ore was run into last week, the pay vein being about 2½ feet in width, with plenty in sight. This recent strike was made on the seventh level, about 400 feet from the surface. In each of the above-mentioned strikes it has been in comparatively virgin ground, very little exploration work having been done for some time, and it was gratifying indeed that the work of prospecting in new ground should prove so successful.

On Florida mountain, the Black Jack mine is working a large force of men. In the past this mine has produced about half a million. Phillips & Sullivan are taking out very rich ore. About 200 tons from the Seventy-Nines mine is being crushed and is "way up." The Wilson mine of Waggon town is running through their mill a lot of about 700 tons. All this ore has been taken from development work. They have immense reserves, and this mine will prove one of the richest in the country. The future output will prove astounding.

The Warren mining district, situated 150 miles northeast of Weiser on the Oregon Short Line) is an old placer-mining district, and was once very rich. About 20 years ago a great many locations were made, but, owing to the then costly modes of reducing ore, they were abandoned, but they have since been relocated and some new discoveries made. Some are all gold, and the rest gold and silver. The ledges are small, but high grade, varying from eight inches to two feet. There are two mills in the district.

The Seven Devils country has undoubtedly the largest copper deposits in the United States. To give an illustration, some of the ledges are said to be 150 feet wide; 200 tons have just

been shipped to Chicago from the Blue Jacket mine. This mine is exceptionally rich. Next spring great activity will doubtless prevail in this district and one adjoining, which is said to be rich in gold ore.

The Mineral district is showing up well. Considerable prospecting and assessment work are being done there. J. L. DOYLE.

From the Yukon.

From now on we may expect the continuous arrival of parties from the Yukon until winter closes up the trail. From what we can learn of the past season's mining in that section, active washing has been almost exclusively confined to the bars on Forty Mile creek, and about the same results as were obtained last season. In the main the bars paid from \$5 to \$25 per day per man, using the most primitive methods for washing—the rocker. As is the case in every mining camp, some of the miners have made moosey, and others nothing. Washing commenced there last spring earlier than usual, the miners cutting through the ice to get to the gravel, which was thawed out and washed, and by this means some of the claims paid well. The ice in Forty Mile broke up from the 12th to the middle of May, after which raining on the stream became general. On account of heavy rains during the first of the season, which caused high water in the stream, washing was confined to the upper bars, which are not as rich as those lower down on the river; but during the latter part of the season, as fast as the waters went down, the miners commenced washing on the low bars, and considerable dust was taken out.

An excitement was raised about 400 miles below the mouth of Forty Mile, on Beaver creek, which caused a stampede to that locality early last spring, but late reports from there are not very encouraging; however, but little is yet known as to what the miners have accomplished there. The probabilities are the miners who went down there will return by way of the mouth of the Yukon.

At no time during last winter and spring were provisions scarce, and prices of such anything but exorbitant, the staple articles being rated as follows: Flour, \$15 to \$17.50; bacon, 40c; sugar, 30c; beans, 20c; butter, 75c; oatmeal, 30c. So far as known only three deaths occurred there last winter—Welch, in January, Mastic, of scurvy, in February, and Anthony Holmes, in February. The miners enjoyed good health, with the exception of slight attacks of scurvy. The winter was the mildest known for years, and in January, the coldest month, the thermometer only indicated 55° below. About 160 men wintered on Forty Mile; others wintered below and some above. About 125 men are now mining on Stewart river, where, in the past, some very rich bars have been worked. The result of this season's mining on that stream is not yet known.—*Alaska Free Press.*

ELECTRIC LIGHT CARBONS.—"Where are all the carbons made that are burned daily in the electric lights in use throughout the United States?" asked a *Mail and Express* reporter of the president of one of the leading light companies in this country the other day. "Two-thirds of them," he replied, "are manufactured in Cleveland, Ohio. There are, according to the latest statistics, about 150 tons in daily consumption, and out of that number a shade over 100 tons are turned out in the 20 carbon furnaces in Cleveland. The capacity of an ordinary furnace is about 45,000 carbons, but some of the manufacturers are now running over-time, so great has the demand grown. Six years ago all the carbons burned throughout the country were made in a single room in Boston, where only ten men were employed. Carbons are made chiefly from the residuum of oil after it has been refined, and the deposit usually found around the natural-gas well is also coming into general use, as it does not sputter when made into carbons. The material is first ground into a powder, when a little pitch is added, and the whole mixed into a stiff batter, when it is run into molds. These are then packed into boxes and the latter placed in a furnace, where they are subjected to intense heat. Carbons are now sold at \$27 a thousand, with the prospect of an early increase in price."—*N. Y. Mail and Express.*

RAMIE.—Two years ago the Newhall Land and Farming Co. secured about a carload of ramie plants and set them out on 2½ acres just above Newhall. The plants flourished, and on Wednesday last a half-carload of cuttings were shipped to San Francisco to be worked up. Ramie grows from rooted cuttings, and is very hardy. They are set out about 18 inches apart. The first year's stalk shoots up about three feet, and continues to increase in quantity year by year until it gains a growth of 8 and 9 feet. When the plant has got its growth the stalks are cut off and allowed to dry until the leaves wither off, and they are then ready to be treated. The portion left standing rots to the ground and a new stool shoots out in the spring. The cost of planting is quite small; it requires comparatively little attention and lives for years. The work of harvesting is inconsiderable—in fact its production costs less than most anything else—and we are credibly informed that the yield returns from \$200 to \$600 an acre.

Passing Events.

The first rain of the season commenced fall-
ing on Thursday, and there will now be no
scarcity of water for mining purposes for many
months. The farmers, too, will rejoice at the
advent of the rain.

There seems to be a general tendency all over
the coast to put up concentrating works, and
many new ones are being erected and planned.
Years ago this step was urgently advocated by
the PRESS as one which would much more rap-
idly advance the mining industry.

There is some discussion at present over the
subject of contractors here sending East and
abroad for machinery and castings instead of
having them made at home. The competition
mainly felt here is that of Chicago foundrymen,
as they have cheap coal and iron and compara-
tively low wages in their favor.

The Governor of the State is building a rail-
road in San Diego county as an accessory to the
development of iron ore deposits in that region,
and fully expects to establish a profitable enter-
prise.

THE Vanconver (B. C.) World says: It is
rumored that Mayor Stewart of Ottawa has
sold the Banff coal mine to an English syndi-
cate for £1,000,000.

Chrome Iron Ore.

No chrome iron ore is produced in the United
States except in California (the Maryland beds
being exhausted), and here it is found in a great
many counties. The traffic has for years
amounted in this State to from 3000 to 5000 tons
a year. The ore has to be carried to be
manufactured to Baltimore, Philadelphia or
Boston, where good coal is cheap, and its prod-
ucts find a ready market.

The value of chrome iron ore in New York, of
a commercial standard of 50 per cent per ton of
2240 pounds, is now \$20, on which there is a
duty of \$3 per ton. The following tables show
the actual cost of production and transportation
in this State:

SAN LUIS OBISPO COUNTY.	
Royalty to owner of land.....	\$2 00
Cost of mining (hand labor).....	3 00
Hauling to railroad station.....	2 50
Rail and steamer to San Francisco.....	3 50
Toll.....	05
Ships freight to New York.....	5 00
Insurance and charges.....	1 00
Total.....	\$17 40
Margin for profit.....	2 60
Average ores 47 per cent.	

PLACER COUNTY.	
Royalty to R. R. Co.....	\$ 25
Mining done by hand labor.....	3 00
Hauling to R. R. (long distance, toll roads).....	8 00
R. R. freight to San Francisco.....	3 00
Hauling to ship; toll.....	70
Ships freight to N. Y.....	5 00
Insurance and charges.....	1 00
Total.....	\$20 05
Best ores, 52 per cent.	

DEL NORTE COUNTY.	
Mining done by hand labor.....	\$ 3 00
Hauling to schooners.....	3 00
Schooner freight to S. F.....	4 50
Hauling to ship; toll.....	75
Ship freight to N. Y.....	5 00
Insurance and charges.....	1 00
Total.....	\$17 25
Margin for profit.....	2 75
Total.....	\$20 00
Average ores, 75 per cent.	

These show the principal places of supply and
the cost of chrome-iron ore. It will be seen
that even from the most favorable deposits
there is hardly a margin of profit left, the in-
dustry being thereby cramped. The profit
would be wiped out if foreign chrome ores
stood on the free list; but the chrome industry
would be one of some magnitude if duties were
placed at, say \$10 per ton, and correspondingly
on the products. Then the poorer classes of
ores could be worked. Being distributed on
private, railroad and Government land, there
would be free competition in working the de-
posits. The advantages derived from miners'
wages, teamsters' work, freight by rail and
water, would all be sacrificed were chrome-
iron ore on the free list as proposed. The im-
port duty is now \$3 per ton, and for the past
year the value has been \$20 per ton in the
Atlantic States, duty paid. With a production
in California of 5000 tons a year, one interest,
worth \$100,000 a year to our home industries,
would be wiped out were this comparatively
insignificant article put on the free list. The
matter will be called to the attention of the
Congressional delegation of California.

The general supply of the world comes from
the Mediterranean sea, Turkey and Asia
Minor, where it is produced by slave labor,
and by foreign ships finds easy access to our
markets. Turkish ore make the commercial
standard of 50 per cent, while California ore,
with rare exception, do not average more than
45 per cent. Our domestic production has
been decreasing, but importations from Turkey
and Asia Minor have more than compensated
for this, so that the total amount consumed in-
creased. There has been also a corresponding
increase in the importation of manufactured
products.

Foundry Notes.

The Union Iron Works have completed the
change on the steamship Walla Walla, which
has been transformed from a collier into a pas-
senger steamer. She started on her first trip to
Victoria this week. The Walla Walla has now
fittings equal to any on the coast. She has an
electric-light plant and is supplied with every
appliance that can add to the comfort and con-
venience of the passengers. The work on her
at the iron works has taken about five months'
time, and the cost was upward of \$150,000.

The Iron-Molders' Union has adopted resolu-
tions condemning the subletting of Califor-
nia contracts to Eastern and Scotch companies.
Union No. 104 will refuse to work for any firm
subletting California work to foreign or Eastern
manufacturers on contracts taken after Nov.

14th. A committee was appointed to wait
upon Adolph Sutro, to request that labor on the
engine for the Howard-street cable line be per-
formed in this city.

The Colliery Disaster.

Another one of those terrible disasters peculiar
to coal-mining regions occurred at Pittsburg,
Kansas, on Tuesday of last week. The ex-
plosion occurred at a time when there were 150
men in the mine, most of whom were at work
at a point 112 feet below the surface. Up to
Sunday at 6 o'clock 39 bodies had been recovered
and also 20 wounded. Of the latter, not to
exceed five will die, probably not that many.
It is thought they have all been discovered.
There were 150 men in the mine at the
time of the explosion, those over and above the
number of killed and wounded having escaped
soon after the explosion by way of the air
shaft.

Superintendent Craig is convinced that the
explosion was due to the ignition of coal dust
following an overcharged blast. Some of the
old miners are inclined to the theory that the
explosion is due to the striking of a pocket of
natural gas. Lack of proper ventilation was
probably the real cause. There is by no means
proper attention given to this matter in this
country, where, even if there are laws on the
subject, they are not rigidly enforced. If the
men themselves who work in the mines were to
emphatically insist on proper measures being
taken, and call the attention of the authorities
to the matter, it would be remedied. Ventilating
apparatus and appliances are expensive to own-
ers, and they omit them as long as possible, tak-
ing chances which sometimes cause them loss of
money, but to the miners loss of life. If the
owners are careless of these things the miners
should not be. The trouble seems to be that so
many men can be found to work in places that
are known to be dangerous that those who will
not be apt to be out of a job. Still the law
ought to take the matter in hand. A large
number of the men killed in this disaster were
Italian and French, who work cheap and are
not apt to make complaints.

About a thousand of the miners met this week
in the vicinity of the mines to take action on the
subject of the explosion. Resolutions strongly
condemning the State Mine Inspector were
adopted and his removal demanded.

Portland Manufacturing Establish- ments.

Our correspondent, in a late circuit of the
manufacturing establishments of Portland, Or-
egon, was surprised at their number and vari-
ety. It is said that the manufacturing indus-
tries of that city employ nearly 3500 men, and
the total value of their annual product is
\$8,000,000. As to iron or metal working estab-
lishments, the Union Iron Works employ 45 to
50 men in a general line of machine work.
Here they are two or three months behind
their orders, and contemplate enlarging the
works to double the present capacity.

The Willamette Iron Works employ 90 to
100 men, mainly in steamboat or marine work.
At present they are completing a sub-contract
from the Union Iron Works of S. F., in put-
ting machinery into a steamer. The Portland
Iron Works employ 35 to 50 men. Here, en-
gine and sawmill work and regrinding and re-
corrugating flour-mill rolls are specialties. The
City Foundry (J. Honeyman & Co.) employ
20 to 25 men. A large business is done in cast-
ing iron fronts for buildings, manufacturing
sawmill machinery, etc.; B. F. Honeyman
superintendent. Smith Bros. & Watson em-
ploy 90 to 100 men. They manufacture bridge
work, and are at present engaged in casting the
iron front for a new hotel in Portland. Weed
& Heintz employ 10 to 12 men, but will soon
increase to 20. Plumbers' supplies and hard-
ware are specialties. The Oregon Brass Works
(D. M. Moore proprietor) are kept busy most of
the time on job-work, but manufacture all kinds
of brass goods, and cast bells weighing as heavy
as 1000 pounds. Trenkman & Wolf employ
20 men, and at present are engaged in bone-
work, boiler and bridge work.

There are many smaller machine shops and
foundries and scores of sawmills, box factories,
planing mills, etc., all of which evince an ac-
tivity in the manufacturing interest which
speaks well for the future prospects of the city.

California Iron.

Governor Waterman has several hundred men
at work grading on his railroad, which is to run
from San Diego back into the mountains. Con-
cerning it he says: "I want to push that road
out about 200 miles, right into the iron mount-
ains, where iron can be got; and I hope to see
big rolling-mills at San Diego, where this iron
will be turned into rails and other articles gen-
erally necessary. There is a big mountain out
there of magnificent iron, called Iron mountain.
I want to see this iron utilized for shipbuilding
and other purposes, too, here as well as in the
South. I have some big schemes in my head
about this railroad and these mountains of iron,
and I think I will eventually get them on a
paying basis."

It is greatly to be hoped that the expectations
of the worthy Governor will be realized, but
there are many difficulties to be overcome. The
greatest of these is lack of proper fuel. We
have no good hard coal in this State, what has
been found being not only scarce but compara-
tively inferior. Charcoal to be used profitably
must be made near the iron ore. The only at-
tempt on any large scale to make iron in this
State was that at Clipper Gap, Placer county,
but litigation, a disastrous fire, and other causes
put an end to work there.

There were only about 900 tons of pig iron
made on this coast last year, and that was in
Oregon. The new furnaces erected not long
since will make a better showing for this year.
But California turned out no iron at all last
year. There is plenty of iron ore here, but cir-
cumstances have so far proved unfavorable to
its utilization.

The Debris Investigation.

Two of the members of the recently appoint-
ed Debris Commission are absent in Oregon on
professional work connected with harbor im-
provement, but will shortly return, when,
doubtless, the commission will be organized and
work commenced. What plan will be pursued
it is too soon to state, as no meeting has yet
been held to decide on any course. The region
affected will, of course, be carefully examined
by the members of the commission. It is prob-
able, too, that parties interested will be asked
to give required information. There is already
a vast mass of testimony collected which is ac-
cessible to the commission. In order that our
readers may be reminded of exactly what this
commission is authorized to do, we here reprint
the Bigge bill, which created it:

Be it enacted by the Senate and House of
Representatives of the United States of Amer-
ica in Congress assembled, that the Secretary of
War is hereby authorized and directed to
detail three officers from the Engineer Corps
of the United States army as a commission for
the purpose of making a thorough examination
and investigation of the mining-debris question
in the State of California, for the purpose of as-
certaining whether some plan can be devised
whereby the present conflict between the min-
ing and farming sections may be adjusted and
the mining industry rehabilitated; and for a
complete examination of the injured navigable-
river channels, their tributaries and lands ad-
jacent thereto, with a view to the improvement
and rectification of said rivers. And that the
sum of \$10,000, or so much thereof as may be
necessary, is hereby appropriated, out of any
money in the Treasury not otherwise appropri-
ated, for the purpose of carrying into effect the
provisions of this Act, said sum to be expend-
ed at the discretion of the Secretary of War,
the said commission to report as early as prac-
ticable to the Secretary of War the result of
their investigation, and the Secretary of War
shall make report thereof to Congress.

On Monday of this week, at Butte, M. T.,
the brake-reel of the St. Lawrence mine burst
with terrific force, and large and small pieces
of the wreck were hurled in every direction.
One piece of iron weighing nearly half a ton
struck a woodpile near the office and caused a
stampede in that building. Fortunately, no
one was hurt. The cables and cages fell to the
bottom of the shaft. It will be ten days before
the mine starts up again.

H. C. PERKINS, formerly superintendent of
the North Bloomfield gravel mine, Nevada
county, more recently of Callao mine, Vene-
zuela, looked in upon his New York friends the
other day on his way to Mexico on mining
business.

THE students of the Mining College at the
University of California are about to undertake
the mapping of the geological formation of the
country back of Berkeley.

Manufacture of Sulphuric Acid.

In continuing Mr. Adams' history of the progress in the concentration of sulphuric acid, Figs. 10, 10a and 10b, illustrate the outcome of much experimenting from 1870 to 1880. Made from the original without change, they will clearly prove, to those but now commencing the use of iron, the perfect knowledge of the subject which the designer possessed. Except constructively, there is little room for improvement in this apparatus, and the successfully working plants of to-day will be found to closely follow in principle, if not in form, this design of a still worked in 1876. In the light of well-known facts, it is difficult to understand why this virtually perfected principle was not adopted by the trade generally, or at least added to the glass and platinum apparatus in all large works, especially where pyrites was used.

It is not uncommon to find an investment of \$20,000 to \$30,000 in platinum stills, pans, etc., in a plant for an output of 30 to 40 tons commercial vitriol daily—several of our American works being equal to this demand. Such an outlay, with attendant wear and tear, interest, and chances of destruction from various causes, can, of course, be borne by but few companies; and the actual cost of running such a plant, though conceded to be very great (some authorities putting it at not less than 20 per cent per year on the investment) has never been published by those alone competent to give figures extending over a term of years.

Several causes, unnecessary to discuss, have combined to bring these foreign-made stills into use in this country, yet in Europe it is an open question, considering all things, whether the cost of concentration is much less in them than in glasses. Investigations into minor details of costs, losses, etc., are more systematically pursued by the chemists of the Old World, and a primary factor, acknowledged by them in this connection, has been, as yet, very little understood by owners of works in America. This is the very rapid destruction of platinum by nitrogen compounds—a common trouble, too often credited to base elements in low-grade blimestone or pyrites ores. Chemists are fully aware how difficult it is to rid sulphuric acid from any small percentage of nitrous acid, and that after many costly experiments the cautious use of ammonium sulphate is now wholly relied upon for this purpose. Considering the few works making use of any process for neutralizing nitrogen compounds, there can be no question but that glass retorts are preferable to platinum alone for general service—certainly so where pyrites containing arsenic is used, and where the demand is for 66° B. acid alone.

Dredging for Gold in Rivers.

(Continued from page 325)

character of the country and the rivers is about the same as here, except that the current is much swifter there.

The scows or punts are moved with five wire cables so as to be held stationary. The cables are handled by means of a windlass. The current wheels are made of boards roughly fastened. The wheels are from 20 to 25 feet in diameter, and make about two revolutions per minute. Although we have before given an

most ridiculous patterns having been sent out from England. These are to work the sea-beaches on the west coast of New Zealand, which in former days were very rich and are now known to be rich under water in the bays and estuaries. They have had no success in beach work with machinery so far. At Hokitika and Kumara, on the west coast of the south islands, experiments are now being made with steam dredgers sent from England. They have been working them by hand for years with shovel and sluice-box. The "beach-combers," who do the work, live like Chinamen. There

Fig. 10a.—PLAN OF FIG. 10.

Fig. 10b.—SECTION AND PLAN OF POT.

Fig. 10.

FIG. 10.—IRON SULPHURIC ACID STILL OF 1870.

engraving of the steam dredger, we herewith reproduce it as a matter of interest in view of the facts here given. The form which has been found most practical is that given in the drawing, except that water-wheels are used for power in most of them.

This same steam dredge illustrated has been working some time. Mr. Rumble talked with Mr. Kinoid, the owner, who said that on the ground it worked the first year it paid 40 per cent; the second year it paid 30 per cent; the third, 20 per cent; and now it is paying from 10 to 12 per cent.

Mr. Rumble says he saw a small experimental dredge called the Wallman, which is worked on the suction principle with a pipe seven inches in diameter, and doing pretty good work. They are talking of building one with a 12-inch pipe, and it may succeed there.

Mr. Rumble says that various attempts are being made with suction dredgers, some of the

is more gold in the black sand than there is in California. Where the steam dredgers are at work is on sloughs at a little island, there being no snrf.

MANUFACTURERS' ASSOCIATION.—The Manufacturers' Association has elected the following officers: William Harney, president; C. T. Woodhury, vice-president; Geo. O. Hickox, secretary; and A. S. Hallidie, W. T. Garratt, Irving M. Scott, N. W. Spaulding, C. T. Woodhury, A. W. Starbird and William Harney, trustees.

Work has been begun on the Pen Darren incline, at the Livermore coal mine, and now men are engaged in sinking on the vein. Additional hoisting machinery has been put in operation and a large gang of men is at work.

THE West Chollar mine has been "listed" on the San Francisco Stock and Exchange Board.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

From the official report of U. S. Patents to Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING NOV. 6, 1888.

392,488.—CENTRIFUGAL PULVERIZER—Jos. Behm, West Point, Cal.

392,412.—WEEDING HOE—W. Dages, Murphys, Cal.

392,562.—ORE-FEEDER—F. A. Huntington, S. F.

392,565.—MAP OR CHART SUPPORT—W. H. Larew, Mariposa, Cal.

392,462.—HEATING AND COOKING RANGE—R. Savage, S. F.

392,474.—WASHING-MACHINE—J. H. Therien, S. F.

392,530.—DRAFT EQUALIZER—L. N. Woodle, Albany, Ogn.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WASHING MACHINE.—Jos. H. Therien, S. F. No. 392,474. Dated Nov. 6, 1888. This washing machine consists of an inclosing outer cylinder formed of staves, which are heveled inclined or so fitted as to form ledges in the interior, and a cylindrical drum rotating within the exterior casing, said drum being formed of peculiarly shaped bars or slats; devices for turning and spreading the contents of the cylinder are fixed within it.

CENTRIFUGAL PULVERIZER.—Joseph Behm, West Point, Calaveras county. No. 392,488. Dated Nov. 6, 1888. The disk of this rotary pulverizer is set in rapid rotation by means of power applied through a pulley on the shaft, and ore is fed into the apparatus at intervals. The rapid rotation of the heaters acts to crush the ore by striking the particles, and also by their attrition with each other and by being forced against the projecting angles of stationary dies within the casing, the discharge taking place through discharge openings.

ADJUSTABLE MAP OR CHART SUPPORT.—Wm. H. Larew, Mariposa. No. 392,565. Dated Nov. 6, 1888. This is an apparatus for use in schools and for similar purposes, and it consists of a frame and adjustable sliding boards guided so as to travel up and down upon the standards of the frame and connected together so as to be moved simultaneously. It also consists of clamps and holders for charts and papers. The boards may be used simply as blackboards to be written or marked upon, or they may serve the purpose of supporting paper or prepared cloth upon which it may be desired to draw permanent diagrams or figures, and they also serve to support charts or maps for other instruction. The whole device can be folded closely together at any time for transportation or to set it aside out of the way. It is light, portable and strong.

HEATING AND COOKING RANGE.—Richard Savage, S. F. No. 392,462. Dated Nov. 6, 1888. This stove or range is so constructed as to be employed for the ordinary purposes of cooking, and also to supply heated air, which may be conveyed to any desired point from the range. It consists of a base or cold-air chamber under the stove or range, into which pure air is received from beneath or outside the house, a fire-box grate, and ash-pan of the usual or any suitable construction, a top arranged in the usual manner for cooking, and an oven, and, in combination with these, of a series of flues and passages, through which air is admitted and conducted around the heating flues or spaces to a suitable discharge from which it is conveyed away. Several rooms may be heated by the surplus heat taken from the kitchen-stove or range, and the atmosphere of the kitchen will, at the same time, be much reduced and made more comfortable to the occupants.

GOLD-MEDAL AWARDS.—At a meeting of the trustees of the Mechanics' Institute this week, Irving M. Scott, as the representative of the Union Iron Works, was presented with the handsome medal awarded by the Mechanics' Institute to the Union Iron Works for the best display at the late fair of California-manufactured articles. Chas. O. Farciot was presented with the "Inventor's" medal for his Mariners' Automatic Registering Compass, an ingenious contrivance for registering the course made by vessels at sea. Both medals are of gold and bear handsome inscriptions on one side, and the personified figure of California on the reverse. The value of each is \$100.

THE Candelaria Con. Mexico Mining Co. of San Dimas, Durango, Mexico, has declared a dividend of 50 cents per share, aggregating \$50,000, payable immediately at the office in this city.

MECHANICAL PROGRESS.

The Iron Supply of the World.

One-third of the pig iron produced in the world is consumed in railway construction. In 1888 the railways of the world consumed about 7,660,000 tons of pig iron. Few people not engaged in some branch of the iron trade are aware what an immense revolution was effected when iron rails began to be generally supplanted by steel. At first the question was, "What shall be done with the old iron rails?" Now, with many there is a fear that there may soon occur a dearth in that kind of iron. Scrap iron is already in greater demand in this country than can be met by the ordinary supply. The whole civilized world is now scouring for scrap iron.

In California scrap iron is very scarce. Men are scouring all the South American coast for old iron to ship to San Francisco. Our rolling-mills are obliged to look over to Europe for a supply sufficient to keep their machinery in motion. The matter of commencing again the production of pig iron in this State is now under consideration.

So great is the demand for old rails all through the country that there has been quite an advance of late in the price. This advance has again brought up as a subject for discussion the question, "How large is the reserve of that rare material still in the tracks?" The opinion is frequently expressed that before long the supply will be exhausted, and that then certain industries dependent upon old iron rails will be forced to turn to something else. Yet, on a careful study of the subject it is found that the day when the last iron rail will be taken up is further away than the majority of those interested seem to think, unless the data collected by the authors of Poor's Manual are based on inaccurate returns. According to that publication, in seven years last passed, the mileage of iron rails has been reduced by 21,579 miles, so that at the same rate of exhaustion the supply would last nearly 20 years longer. Of course there are many considerations influencing the rate at which our rail-mills and the works running on track material draw on the reserves. The questions of the relative cost of new steel rails, of accessibility of the old material, of the future demand for finished product, of the relative cost of old iron and new steel, angles, bars, spikes, etc.—all these considerations affect the problem. But the scare of an early end of the supply of old rails may as well be dismissed. They will last ten years longer at least.

THE MANUFACTURE OF PORTLAND CEMENT.—This cement is a commodity which has been in enormous demand almost everywhere. But although so universally used, you will not find one man in ten who can tell you what it is composed of, so a little light on the matter may be acceptable. Portland cement is an artificial product, chemically proportioned by the proper selection of the material entering into its composition. These, whether chalk or clay, as in England, marl or clay, as in Germany, or hydraulic limestones, as in this country, are in every case reduced to the finest powder by either wet or dry grinding, and this powder moistened merely in the dry process, or in the form of paste in the wet process, becomes practically, either by drying in large tanks or by being molded into bricks, eggs or other forms, a new stone, into which all the elements are brought in close contact and are in perfect chemical proportions. The artificial-made new stone burnt, as it is, at high heat in close kilns, has all elements chemically active, and the clinker represents practically, when properly proportioned chemically, a composition of hi-basic silicate of lime and aluminate of lime. This ground clinker is the Portland cement of commerce, a fixed uniform product, sold under a warranty of its strength and firmness, and depends upon the controllable elements of skilled manufacture for its character and uniformity.—*Commercial Bulletin.*

BUTTER AND NAILS.—"When England furnished America with all the nails she used it required ten pounds of butter to purchase ten pounds of nails. To day, in the same locality in America, one pound of butter will purchase ten pounds of nails, and of a much better quality than those received in the old days from England. If America had not adopted her protection policy, she would still be producing cheap butter to exchange for dear nails. Other countries prevailed, and, under an almost prohibitive tariff, nail works were established. To-day America produces all the nails she uses, and is able to sell them at a price far below that charged before the tariff was imposed. In the meantime butter and all other agricultural produce have risen in value, on account of the increased demand for home consumption in local manufacturing centers, and the condition of the farmer is vastly more prosperous." The above was penned by a writer in the *Morning Post* of London, a British Tory Free Trade organ, which differs from some American Free Trade organs in that it sometimes admits to its column truths that tell against its pet hobbies.

ALUMINUM STEEL.—A new metal to be known as "aluminum steel" has been produced at the laboratory of Messrs. Brin, College street, Belvidere road, Lambeth, Eng. A charge of about 40 pounds of broken cast iron, smeared with clay and a special flux, was trans-

formed, by the direct action of heat, in a small ordinary foundry furnace into excellent steel containing two per cent of aluminum. Under a Fletcher's blowpipe and Brin's compressed oxygen, a strip of iron is not only covered, but so amalgamates in the aluminum as to become practically a hard and elastic steel.

CHEMICAL VS. MECHANICAL TESTS.—In the *Ironmonger*, London, Mr. H. J. Skelton attempts, on behalf of steel works, to dissuade engineers from adopting a standard of chemical analysis, denying that the present state of the scientific branch of metallurgy (chemistry) warrants laying down a standard for soft-steel manufacture, such as is proposed by the ex-president of the Iron and Steel Institute, Mr. Daniel Adamson. Of the four metalloids—carbon, silicon, phosphorus and manganese—permitted to be present, it is impossible to exactly fix and control the proportions. He praises the recent paper of Mr. R. A. Hadfield on manganese, and then says: "Who knew the peculiar effects and properties in varying proportions thereof prior to its publication? Look at the effect of aluminum on cast iron and the mottos castings. What is to be done to arrest oxidation in steel, which has of late so alarmed shipowners and made the makers of iron plates busy for months? Of what use is chemical analysis and mechanical test in the higher forms of steel—in crucible cast tool-steel? The principal ground for antagonism to fixed chemical tests is the utterly unscientific and reactionary state of mind it reveals. Far too much of arbitrary limitation already exists in steel manufacture."

A NEW TELEGRAPH WIRE.—Mr. D. H. Craig of New York, who has devoted 19 years to the development of machine telegraphy, and who, among many other things, claims to be able to telegraph 2000 words per minute from each end of a wire, a total of 4000 words in 60 seconds, has recently devised a new telegraph wire, made of pure copper with a slight mixture of silica, which is said to increase the tensile strength to twice that of steel of equal size, the exact tensile strength being reported at 133,000 pounds to the square inch. An ordinary No. 4 gauge wire weighs over 900 pounds per mile, and has but one ohm of electrical resistance per mile. With such a wire extending from New York to San Francisco, the electrical resistance would be about 3000 ohms, while a majority of the telegraph wires between New York and Washington show an electrical resistance of more than 4000 ohms. The significance of the facts is that the new siliconized copper wire will bring San Francisco nearer to New York, electrically, than New York is to Washington.

IMPROVED RAILWAY STATIONS.—The great improvement which has taken place in the methods of railway construction and equipment within a few years is exemplified, says the *Railway Age*, among other ways, by the increased taste and expense shown in connection with station buildings. The ordinary railway station in the United States until recently had been a hideous structure of pine boards, generally painted red, if painted at all, and consisting, except at the larger points, of one or at most two rooms for the accommodation of passengers, with a little den for the ticket seller. The interior was cheerless and repulsive, and the exterior was as devoid of architectural taste and beauty as a monstrous dry goods box. But this era of unnecessary ugliness seems to be passing, and now railway companies are devoting much attention to the construction or enlargement of their stations great and small, not only to making them comfortable and convenient for passengers and employees, but also to making them architecturally attractive without.

ACCIDENTAL ALLOYS.—The great changes which are produced by small proportions of foreign matter in metals are not necessarily of small practical importance, as very slight impurities in metals for certain purposes might lead to serious consequences. Robert Austin gives two striking illustrations of this possibility. A small fraction of bismuth in copper will reduce its electrical conductivity sufficiently to cause any submarine cable made with it to become a commercial failure, and the message-carrying power of copper cables is said to have doubled since the early days of telegraphy, on account of the increased purity of the copper. Pure gold has a breaking strain of from 16 to 17 tons to the square inch; but when alloyed with but two-tenths of one per cent of lead it will break with a slight blow under a trifling strain.

TO TEMPER STEEL ON ONE EDGE.—Red-hot lead is an excellent thing in which to heat a long plate of steel that requires softening or tempering on one edge. The steel need only be heated at the part required, and there is little danger of the metal warping or springing. By giving sufficient time, thick portions may be heated equally with thin parts. The ends of wire springs that are to be bent or riveted may be softened for that purpose by this process, after the springs have been hardened or tempered.

A PORTABLE TURNABLE has been invented by J. W. Warburton for the turning of cable cars when stopped by fires, broken gripe or other causes. The table is constructed on wheels, built in sections, and can be hauled to any spot by horses or by the cable itself. The table is built of iron and weighs 12,000 pounds.

SCIENTIFIC PROGRESS.

Heat from Electricity.

Little has yet been done in heating by electricity. The common belief is that it would be too costly. We can get 60 per cent of the total energy as useful heat from a furnace and but 10 per cent from an electric current derived from a dynamo run by steam. Stoves do most of the heating in towns, and they give but one-fourth of the total energy in useful heat. Three-fourths of the heat passes up the chimney. Air rushes through crevices of doors and windows in draughts which are injurious to health.

Suppose the case of a house heated by electricity in a town. Let the current come from the central station and heat coils of flat-iron wire. These coils may each cost less than a dollar, and they may be in any part of the house. For cooking and baking the coils may be placed just under or around the vessel holding the article cooked. Less heat than usual would be required, for no soot would be on the bottom of the containing vessels. The fire risk would be much less than at present, as the wire never need be hot enough to cause fires. The heat supply can be turned on or off instantly; thus there will be no loss of fuel when the need of heat has ceased. This applies with great force to summer use.

In heating, cooking or baking, the temperature can be easily kept uniform. Without rising in the morning, the touch of a button at the bedside will turn heat on several coils in different parts of the house. The nuisance of kindling, smoke, ashes and soot will be abolished, and no stove-pipes and chimneys will be needed.

I have said that we may get 10 per cent of the heat energy expended at the central station, and that in using a stove we may get 25 per cent. When we count the cost of stove-pipe, chimneys, shovels, ash-efters, kindling, trouble and great fire risk, I believe electricity will be found the cheaper.

When the dynamo at the central station can be driven by water, great economy may be obtained. Water-power can be supplied ten hours a day at \$20 and steam at \$50 to the annual horse-power. In this case steam costs two and a half times as much as water. From my previous statements it will be seen that electric heating would cost two and a half times as much as heating by stoves, and in using water-power to generate electricity the heat will cost the same as when produced in stoves, even neglecting the cost of stove-pipes, chimneys, etc.

Platinum wire has been used for electric heating, but surely the fact that iron is as good must have been ignored. The conductivity of soft iron is nearly as low as that of soft platinum. The ratio of the temperature of melting is as 20.73 to 18.03, and the cost nearly as 1 to 5000. I propose to use flat wire, for better results will be had when the heating surface is large. The coils may be suspended from the ceiling.—*Electrical World.*

Electrical Production of Diamonds.

The Hon. C. A. Parsons describes, in an interesting communication to the Royal Society, which is published in abstract in *Engineering*, a number of experiments which he has recently made on carbon at high temperatures and under great pressures, and in contact with other substances. The primary object of the experiments was to obtain a dense form of carbon for use in arc and incandescent lamps, for, as it is well known, could the life of the carbons of either lamp be prolonged, a considerable economy would be effected in electric lighting. Looking at the experiments from this point of view, it may be stated that the test trials were not entirely successful, though a very dense form of carbon was in one case obtained, but nevertheless some results are of very great interest, as, though the author expresses himself very cautiously, it would appear that he has succeeded in producing diamond dust artificially. The arrangement of the experiment was as follows:

A massive cylindrical steel mold of about three inches internal diameter and six inches high was placed under a hydraulic press, the bottom of the mold being closed by an epigot and asbestos rubber packing—similar to the gas check in guns; the top was closed by a plunger similarly packed; this packing was perfectly tight at all pressures. In the epigot was a vertically bored hole, into which the bottom end of the carbon rod to be treated fitted; the top end of the carbon rod was connected electrically to the mold by a copper cap, which also helped to support the carbon rod in a central position. The block and epigot were insulated electrically from the mold by asbestos and the leading wires from the dynamo being connected to the block and mold respectively, the current passed along the carbon rod in the interior of the mold. The free space in the mold was filled in turn with different hydro-carbons and with other materials. Among the liquids acted on were benzine, paraffine, treacle, chloride, and bisulphide of carbon, and the solids included silica, alumina, carbonate, and oxide of magnesia and almina. The pressure employed ranged from 5 to 30 tons per square inch. In the experiment with silica the density of the carbon was increased 30 per cent, and in no other case. The most interest-

ing set of experiments was when the mold around the rod was filled with a layer of slaked lime about one-fourth inch thick, surrounded by two inches of silver sand, followed by a layer of lime of the same thickness, and finally by a layer of coke dust. The pressures used ranged from 5 to 30 tons, and the current from 200 to 300 amperes, the carbon being in different experiments from one-fourth inch to five-sixteenths inch in diameter.

Under these conditions there was obtained on the surface of the carbon rod a powder of a gray color, harder than emery, and capable of scratching the diamond. This powder is, therefore, very probably the diamond itself.

AIR IN WATER.—A correspondent asks the *Manufacturer and Builder* why it is that in compressing water the air is not forced out—which is found not to be the case. The answer to the query furnishes some facts that may be interesting to our readers. We reproduce it as follows: "Water, as well as many other liquids, has the property of absorbing many gaseous substances without thereby increasing in volume. Far from reducing the capacity of the liquid to absorb a certain gas, the application of pressure increases it, the law being substantially that the amount of gas absorbed increases directly as the pressure increases, and vice versa. Thus, if water at ordinary atmospheric pressure will absorb one-fourth of its volume of air, at two atmospheres it will absorb another one-fourth, at three atmospheres another one-fourth, and so on. The capacity of water to hold large volumes of gaseous substances under pressure is well shown in the familiar example of carbonated waters. These are bottled under considerable pressure, the gas itself furnishing the pressure, in order that they shall become charged with a great quantity of the gas, which, being liberated as the pressure is removed by drawing the cork, gives rise to an agreeable effervescence. In absorbing or discharging the gas, however, there is no change in the volume of the liquid. The process of gas absorption may, in fact, be compared with the act of dissolving a salt in water. The salt finds its way in some manner among the molecules of the liquid without increasing its bulk; so also does the gas. There are exceptions to the rule, however, as where an actual chemical union takes place between the liquid and the gas; but this is not the case with air and water, which is simply a case of the solution of the atmospheric gases in the liquid."

CONDENSED LITERATURE.—"The tendency of the times," remarks the *Norwich Courier*, "is toward condensation. We have condensed beef, a small portion of which, dissolved in hot water, gives one a draught containing as much nourishment as a whole beefsteak. We also have condensed milk, and condensed food of other kinds, which contain a maximum amount of the essential quality within a minimum amount of space. How far this tendency toward condensation will eventually carry men in the matter of food, it is difficult to predict. Perhaps the time will come when the art of extracting and condensing the active principles of costliest meals will be so advanced that one may be able to obtain in a small pellet as much refreshment and nourishment as he now obtains in a whole meal. Then, all the time now consumed by the good housewives in preparing breakfast, dinner and supper, and by the business members of the family in going to and from and eating their meals, will be saved. There will be no roasting over the kitchen stove, no trouble washing dishes, no worry over a varied bill of fare, no agitation over broken china, etc. A person will carry a few food pills in his pocket, and when he grows hungry will take one and swallow his whole meal at once, perhaps." To the above we might add that the great need of condensation required, just at this time, is newspaper condensation. Our papers, daily and weekly, should be reduced fully one-half in number and fully three-quarters or more in matter. The labor and time required to select the really valuable matter in the average newspaper has become a most grievous tax upon the average reader and one that should be promptly abated.

A REMARKABLE TELEPHONE.—The *Hartford Courant* remarks: The Adjutant General's office at the capitol has been connected with the room of the Quartermaster-General on the third floor by means of a Hall short-distance telephone line. The wire employed is composed of six strands of steel, wound around a cord covered with a preparation of paraffine, which prevents induction. No battery is required, and the voice of a person standing in the room at a distance of 20 feet from the instrument can be distinctly heard at the other end of the line. By means of this remarkable invention the Adjutant-General and his associates can carry on a conversation with those connected with the other departments without leaving their desks. The new telephone has been used with great success in other cities. The limit is five miles, but the inventor hopes to exceed this in the near future. It is to be hoped that this new telephone will be instrumental in breaking up the present outrageous telephone monopoly, at least for short distances.

THE HUMAN STEP.—Among the continental armies the German soldiers have the longest legs, judging by the length of step. It is 80 centimeters. The step of the French, Austrian, Belgian, Swiss and Swedish is 75 centimeters, and of the Russian, 71. Thirty centimeters make a foot.

USEFUL INFORMATION.

Twenty-Four Grammatical Readings of the Same Line.

To illustrate the numerous grammatical changes which can be made in a single line or sentence, the following may be presented:

The weary plowman plods his homeward way.
The plowman, weary, plods his homeward way.
His homeward way the weary plowman plods.
His homeward way the plowman, weary, plods.
The weary plowman homeward plods his way.
The plowman, weary, homeward plods his way.
His way the weary plowman homeward plods.
His way, the plowman, weary, homeward plods.
The plowman, homeward, plods his weary way.
His way the plowman, homeward, weary plods.
His homeward, weary way, the plowman plods.
Weary, the plowman homeward plods his way.
Weary, the plowman plods his homeward way.
Homeward his way the weary plowman plods.
Homeward his way the plowman weary plods.
Homeward his way the weary plowman plods.
The plowman, homeward, weary plods his way.
His weary way the homeward plowman plods.
Homeward the plowman plods his weary way.
Homeward the weary plowman plods his way.
The plowman, weary, his way homeward plods.
The plowman plods his homeward weary way.
The plowman plods his weary homeward way.

THE GREAT LEAKY LOG RAFT which was out adrift in mid-ocean has proved of much benefit to those who are engaged in the study of ocean currents—and thus to science. Ever since the logs which composed it have been drifting about in the ocean currents, they have been closely watched by navigators and their position carefully noted and reported by passing vessels, and now, after the lapse of several months, the office at Washington has compiled these observations and issued a carefully prepared pilot chart. This chart, which represents the course which the logs took after the raft was broken up and the points in mid-ocean in which they were found, shows at a glance the general directions of the currents and gives an object lesson to the mariner that could scarcely have been given in any other way. Of course Mr. Leary's contribution to science was an involuntary one, but it has been no less valuable on that account, and has advanced the study of ocean currents in a way that no one deemed possible before the disaster occurred. One of the peculiar features of the affair is that what happened was just what the scientists had long desired to do, but it was rather too expensive an experiment to be made voluntarily. Thousands of floating logs on the Atlantic meant too much danger to shipping to permit of the Government's placing them there. However, no serious disaster has occurred from collision with any of these logs, and the wreck of the great raft has therefore been both instructive and harmless, except to the gentleman who owned it.

A NEW HUSKING MACHINE.—A simple device by means of which the husk of corn can be easily and quickly torn from the ear has been patented by Theodore H. Mehrling of Niobrara, Nebraska. The device has jaws which open and close like sharp blades, each of the jaws having concave sides, which, when closed, form a cup-like cavity, the meeting edges being cut away at the middle to form an aperture when the jaws are closed. Each jaw has a row of short inwardly projecting teeth around the edge, with a pointed prong on the outer end to guide the ears of corn into the space between the jaws. The jaws are not in the same plane with the handles, but at a considerable angle thereto, and the large side of the handle has a sharp-edged tooth to be used to cut the silky threads on the ears. The operator holds the husker with his right hand, with the left taking an ear of corn by the outer end, when he opens the jaws and passes the pointed ends over the stem of the ear until the inner end of the husk is inclosed by the jaws, so that the stem of the ear projects through the aperture. The jaws are then closed so that the teeth penetrate the husk, when, with a slight twist, the ear is freed from the husk by breaking the stem.

MR. EDISON'S BABY AND HIS PHONOGRAPH.—According to the New York Herald, Thos. A. Edison, the inventor, has been interesting his inventive faculties with his new baby and a phonograph at his home. When the baby crowded with glee, the crow was registered on the phonograph; when it got mad and yelled, its piercing screams were irrevocably recorded on the same machine. That phonograph is now a receptacle of every known noise peculiar to babyhood. It is Mr. Edison's intention to take a record of the strength of the baby's lungs every three months. "I will preserve the record," said he, "until the child becomes a young lady. Then the phonograph can be operated for her benefit, and she can see for herself just what kind of a baby she was, and won't have to take her mother's and the nurse's words for it."

THE BURNING-GLASS AGAIN.—In discussing the unsuspected causes of many fires, a correspondent of the New York Tribune says: "A few days ago an acquaintance of mine had occasion to repair a chimney, and in doing so put in an oak post as a support between the bricks and the garret window. The next day he discovered this post on fire, although there was no fire in

any other part of the house. He promptly extinguished the blaze, but kept a strict watch. The next day the same thing occurred, much to his alarm. Passing by, I was called in to see the charred post, and was asked for some explanation of the origin of the fire. On examining, I found a circular blister in a window glass, near the wooden support, convex enough to form a lens—a burning-glass. My neighbor was informed that on the next day promptly at 10:30 A. M. his house would in all probability be endangered again. True, the fire started, but spectators were on hand to stay it. This incident, in my estimation, does away in many cases with the ultra theory of spontaneous combustion. In factories and warehouses, where combustible goods are stored within focal distance of such defective glasses, such fires will often occur, as any one familiar with the principles of the convex lens will admit."

CLEANING CLOTHES PROPERLY.—"My experience has always been never to use either hot soap or hot water, but to use both lukewarm. By using either soap or water too hot, especially on goods that are very greasy, I find it has a tendency to set the grease, and when once set it is very difficult to loosen again. This is also the cause (one great cause, at least) for cloudy goods. As for the strength of soap, a man must use his own judgment; it all depends on what the goods are. If the goods are very thin, less strength and less soap are required; if heavy, why, of course, more strength is necessary. Some men who claim to be finishers think that the less soap used and the more alkali, the better the result. My practice is to use soap enough to create a lather, and just enough alkali to overpower the grease in the goods; by so doing we not only cleanse the fabric but also preserve the color."

A NEW USE FOR SUGAR.—The French Ministry of Agriculture has recently had a number of tests made which all go to show that meat can be preserved by sugar in a much more satisfactory manner than by salt. The salt is somewhat cheaper, but its effect is to destroy to quite a degree the nutritive qualities of the meat with which it is brought into contact; while if meat is packed in powdered sugar a coating is formed over the outside, the juices of the meat are retained, and not the least harm results. When sugar-preserved meat is to be used, all that is necessary is the soaking of it in water, which speedily removes whatever traces there may be of the preserving substance. It is thought that the result of this investigation may lead in time to important changes in the meat-preserving industry.—*Merchants' Journal.*

TO HAVE CALLAS BLOOM SUCCESSIVELY.—The following directions from the *Ladies' Home Companion* may be relied upon to produce the result if carefully followed: "A calla flower with its stem should be promptly removed as soon as it begins to fade. Cut the stem low, being careful not to injure the young bud, which you will find starting up close to the old stem. By this means three flowers will sometimes be successively produced upon a single stem. The first, of course, is the largest and finest flower of the three, though the others are often well developed. When blooming, water freely with warm water, adding a few drops of spirits of ammonia once or twice a week to encourage a strong growth."

CIDER MAKING.—By the application of artificial power in the manufacture of cider it is believed that the quantity of the same is to a great extent impaired. According to the present rapid method the apple is ground, rasped or mashed, as the case may be, goes immediately to the press and the clear juice expressed. By the old and slow method of grinding by animal power, by the old sweep motion, the ground apples fell into a large tub or vat and there remained for 12 to 24 hours or until incipient fermentation had set in, and then pressed when the cider is more highly colored and of much more body, as it is termed, and for domestic purposes much better.

ANOTHER MAMMOTH GRAPEVINE.—This new candidate for public observation is to be seen at Bayly's San Gabriel hotel, Los Angeles county. The vine is 4 feet 2 inches in circumference, and some of its branches are 15 inches in circumference and 100 feet long. Fifty-five years ago, Gen. Vallejo, a young man of 40 years, stood under its shady branches, and today, could it but feel the gratitude expressed by the tired tourist as he partakes of his meal under its lovely arbors, it would surely wish to live another century.

HANDLE KEROSENE, benzine and gasoline by daylight only. Where gasoline is stored, see to it that there is ventilation from beneath, as the vapor from it, which is highly explosive, is heavier than air, and will not ascend, but must be allowed vent below. If these precautions are observed closely, the danger of fires from these inflammable fluids will be reduced to a minimum.

SOOT ON THE CARPET.—If soot happens to be dropped on a carpet, throw down an equal quantity of salt, and sweep all off together. The soot will hardly leave a trace.

A STOPPER FOR RATS.—A correspondent says: Soak one or more newspapers, knead them into a pulp, dip the pulp in a suitable solution of

oxalic acid. While wet, force the pulp into any crevice or hole made by mice or rats. Result—a disgusted retreat, with squeals and feet, on the part of the would-be intruders.

A CHEAP ICE-CHEST.—Take two dry-goods boxes, one of which is enough smaller than the other to leave a space of about three inches all around when it is placed inside. Fill the space between the two with sawdust packed closely, and cover with a heavy lid made to fit neatly inside the larger box. Insert a small pipe in the bottom of the chest to carry off the water from the melting ice, and you have a very cheap and tolerably effective ice-box for family or grocer's use.

GOOD CEMENT.—Stir to a thick batter with silicate of soda, 12 parts Portland cement, six parts slaked lime, six parts fine lead, one part infusorial earth. Very excellent for marble and alabaster. The cemented object need not be heated. After 24 hours the fracture is firm, and the piece can with difficulty be found.

INK FOR HAND STAMPS.—To make an ink for hand stamps that will not injure the rubber, mix and dissolve 2 to 4 drams sniline color, 15 ounces alcohol and 15 ounces glycerine. The solution is poured on the cushion and rubbed in with a brush.

ARTIFICIAL PUMICE-STONE is now being made in Germany by molding and baking white feldspar and fire-clay.

ELECTRICITY can now be produced by steam at a cost of six cents per hour for 1½ horse-power.

GOOD HEALTH.

Nervous Phenomena.

The power of the imagination over the nervous system and the seat of intelligence and consequently upon muscular action has often been commented upon in these columns. We have also remarked on more than one occasion upon the contagious influence of mental excitation and nervous derangement. This is manifest in a marked degree in times of great religious excitement, when the nervous system in an ecstasy of excitation induces muscular contortion or leads the subject into exclamations of delight and joy or into manifestations of the deepest woe, and the excitement of one person is rapidly communicated to and similarly affects many others.

A remarkable case is now reported from Wilkesbarre, Pa. In a silk-mill in the place a large number of young women are employed. Normally they are healthy and strong, in fact a body of youth of exceptional physical excellence. Recently one of the young women was taken with an epileptic fit. As she had never before been thus visited, and there was nothing in her physical condition to indicate predisposition in that direction, the surprise in the workroom was very great and the alarm concerning the girl's welfare excessive. She was prostrated upon the floor, and varied her contortions with occasional piercing cries of agony. Her workmates were gathered about her, solicitous to render her aid, but naturally were much excited. Presently, and without any warning indications of the affection, one of the girls uttered a wild cry that ended in a painful shriek, and the young woman fell over in a fit, closely resembling that of the epileptic at her side. Naturally this event greatly increased the alarm and in a few moments another girl went into hysteria of the extreme character, and then in rapid succession another and another was seized and convulsed in the most violent form, until no less than 16 had either fallen to the floor or reeled about in a frenzy of hysterical madness. When the physicians reached the scene they experienced great difficulty in restoring the young women secondarily affected, while the one who had the truly epileptic fit yielded readily to the restoratives applied. Several days elapsed before any of the young women were sufficiently nerve settled to resume their places in the mill.

There can be no mistake concerning these cases; they were examples of contagious hysteria of the most valuable character to medical science, for probably no instances have been recorded that were of greater significance, as they were very sudden and very rapid in their succession. Unlike most former cases, there was preceding them no long period of mental strain, no extended brooding or abnormal disturbance of the intellectual powers, no contemporary period of long-continued and culminating excitement and gradually increasing mental tension.—*Exchange.*

WHY MEN SHOULD NOT SHAVE.—Shaving is a dangerous habit. You can trace nearly every case of toothache and facial neuralgia in a man to the habit of shaving. If all men protected their throats by chin-whiskers and the nerves of the face by a liberal growth, you wouldn't hear of half the present ailments. Shaving opens the pores of the face and invites neuralgia to step in and twitch the nerves.

ELECTRICITY FOR WRITER'S CRAMP.—In one of the broad windows of the recording department of the office of James Bond, clerk of the Superior Court, is a small electric battery, says the Baltimore Sun. It is used by the recorders for the relief of the cramp of the muscles of the hand, which follows long con-

tinued and steady use of the pen. The relief is instantaneous, and clerks who were formerly compelled at times to stop work for several days on account of swelling and contraction of the muscles of the hand now take a few gentle shocks of the electric current on the slightest approach of stiffness. They return to work at once, entirely relieved, and continue without inconvenience. Nearly every one of the score of clerks receives benefit from the electric current, and the battery is regarded as an indispensable fixture of the office.

THE TOMATO IN BRIGHT'S DISEASE.—When Thomas Jefferson brought the tomato from France to America, thinking that if it could be induced to grow bountifully it might make good feed for hogs, he little dreamed of the benefit he was conferring upon posterity. A constant diet of raw tomatoes and skim-milk is said to be a certain cure for Bright's disease. Gen. Schenck, who, when Minister to England, became a victim to that complaint, was restored to health by two years of this regimen. With many persons the tomato has much the same effect upon the liver as a small blue pill, and whether it is as a people we are less bilious than in former years, or that the doctors of the new school practice less severe remedies than did those of the past, it is certain that mercury is prescribed with less frequency than of old.

GRAPES AS FOOD.—It is now conceded by scientists and well-informed men in all professions, that as food for human beings, there is nothing in the vegetable world superior to grapes, and they not only give strength, endurance and vivacity to those who regard themselves as well, but restore the sick and debilitated to health, when eaten freely during the vintage seasons of the year, in the vineyards, or fresh from the city markets. It is also a well-established fact in grape regions that the large number of girls who work among grapes continuously throughout the season of picking and shipping, which is from September to December, or later, gain in flesh from 5 to 20 pounds, and many who come from the cities in debilitated health return to their homes well and strong.

BEAUTIFUL HEROISM.—Acts of heroism in medical life are so frequent and appear to be so natural a part of it that they are not chronicled as often as they should be. One such deed, however, recently found its way into the *British Medical Journal*, where it is mentioned as an illustration of the self-sacrifice of medical men in behalf of suffering humanity. It is the case of a surgeon in the British army named Landon. Mortally wounded himself, and with the grasp of death rapidly closing down on him, he heard a wounded soldier crying out from the sharp pain of his hurt. Forgetful of self, he crept with difficulty to where the man lay and gave him a hypodermic injection of morphia to lessen suffering, and, having given it, lay down and died by the side of the soldier.

REMARKABLE ENDURANCE BY A CHILD.—A little tot of four years and six months strayed off in England recently, and roamed about fields for 117 hours, eating nothing but the heads of growing wheat and being totally without water. When found, the child was in a semi-conscious state, but shortly came round all right and no ill effects followed. The case is mentioned by a physician in the *British Medical Journal* who says that, taking all things into consideration—the child's age, no proper food or drink for 117 hours, the exposure to the wet and cold weather prevailing at the time, the misery and the loneliness it must have endured for so long a period—it seems somewhat remarkable that life was preserved.

THE ELECTRIC LIGHT ON HEALTH.—We have noted in several of our exchanges that the electric light has been thought to affect unfavorably the health of those exposed to it. Now comes the statement from an English paper, which says that it is shown that the introduction of the electric light in the Central savings bank in London has reduced the average amount of absence from illness about two days a year for each person on the staff. This saves the bank about £640 sterling a year. The electricity costs more than gas, but the saving in clerk-hire more than makes up for this, leaving £266 per year "to the good."

HOT WATER FOR IVY POISONING.—A correspondent in the *Scientific American* writes as follows: Let me add my testimony as to the efficacy of hot water in curing the poison by ivy. The best way of applying it is to keep a spirit-lamp under the tin containing the water, and apply the water as hot as the skin will bear. The sensation of relief from the intolerable itching is so immediate and so complete that it is almost worth while to be poisoned by ivy to experience it.

EFFECT OF COCAINE AND MORPHINE.—Frank Johnson, a paper-hanger, 28 years of age, was recently sent to the Napa Asylum for the Insane. The excessive use of cocaine and morphine has brought on mania. He did not dare to go to bed for several nights, owing to the fiendish visitors that passed before his eyes. It is said that Johnson was in the habit of smoking 50 cigarettes daily.

COLORS LIGHTS are being tried in treating the insane. Red light is said to cure melancholia; blue, to quiet insomnia.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CONCENTRATORS.—Amador *Dispatch*, Nov. 10: Four Frue concentrators have been added to the McKenzie mill at Irishtown. A new water-wheel has been set up at the Reed & Askey mill at Irishtown; it was set in motion last Tuesday. They have the prospect of a two to eight-foot ledge. The Lavezzi five-stamp mill between Irishtown and New York Ranch has been completed, and will be started up as soon as sufficient water can be had.

Butte.

GOLD-DUST.—Oroville *Mercury*, Nov. 9: In its last issue the *Mercury* stated that the firm of Thompson & Kellogg of Spanish Ranch had bought this year \$27,000 worth of gold-dust from the small mines in that vicinity. A note from one of the firm corrects the figures and makes an interesting item as follows: He says: "In 1886 we purchased \$50,000; in 1887, \$27,000; and 1888 to Nov. 1, \$30,000, with a good prospect of more next year if a good supply of water can be secured." This is a remarkable output of gold when it is remembered that it is taken with picks and shovels from the gulches and mines in that vicinity.

A MISFORTUNE.—Wm. J. Hammond of Pittsburg, Penn., has commenced a suit in Chicago against Francis E. Hinkley for \$65,000. It seems that Hinkley agreed to pay the mining expenses of the Aurora mine in this county for one year for a fourth interest. Mrs. Church, acting as the agent of Hinkley, has charge of the work, and this suit is to recover the expense of working the mine. As many parties in this county have money due them from this mine, they will look with interest on the result of the suit. We understand that there are 28 laborers' liens filed against the mine, and that some of the Oroville merchants have bills against it to the amount of \$3000. Such mining ventures as this are decidedly injurious to Butte county mines. Companies are formed in the East, and some theoretical chap from the East who never saw a mine is sent out to superintend it. The consequence is, fortunes are sunk and Butte county mines fall into disrepute. On the contrary, experienced miners take hold here and make fortunes.

MILL.—C. C. Belding came down from Forbestown yesterday and reported lively times up there, and the Shakespeare mine is panning out finely. W. W. Stowe will soon have four Huntington mills in operation, and C. J. Nickerson is putting up a stamp-mill. The mines are prospecting remarkably rich, and it shows the confidence of Mr. Stone in the mineral wealth of the locality. It is only necessary to state that he has recently purchased another mine which he intends to develop. The Gorton hotel is full all the time and old Forbestown is returning to its former glory as a mining camp. May she pan out millions.

Calaveras.

UNION.—Angels *Record*, Nov. 9: Work on the Union mine is being vigorously pushed. We are informed there are good prospects in the bottom of the main shaft, but owing to the depth attained the present hoisting works are not powerful enough to sink any deeper and that work at that point has been temporarily suspended. The company, however, has a full force of men employed in sinking new shafts to more fully represent the lead. In a shaft that is now being worked on the north end of the mine, very fair prospects are obtained, and it is believed that the machinery formerly used at the main shaft will be moved there, and more powerful machinery erected in place of the old works.

El Dorado.

THE LINDEN MINE.—Cor. Placerville *Observer*, Nov. 9: I had been here a year and had never entered a mine. As we entered the tunnel we walked erect under a smooth arch of rock for some distance. We proceeded in a straight line for 800 feet, then curved to the left and advanced 800 feet and curved again to the left and continued until we were 2500 feet from the mouth of the tunnel. We passed five branch tunnels aggregating 1000 feet. These we explored on our return. Toward the farther part of the mine a tunnel has been opened up into an old incline that extends to the surface, and through this fresh air is constantly supplied, doing away with the old arrangement of air-boxes and providing a means of escape should a serious break or cave occur. At the end of the main tunnel they were following a bed of gravel from which the gold panned was taken. At the end of a branch nearly parallel with the main tunnel they were digging through porphyry and slate rock. The side branches have followed gravel-beds and will be continued in the future. Fourteen men were at work during the day shift, and as the work is extended a larger force will be required.

THREE-STAMP MILL.—Georgetown *Gazette*, Nov. 9: Charles Kane and M. S. Creagh, owners of the Last Chance quartz mine near Volcanville, are preparing to start up their 3-stamp mill. They have a 5 or 6-foot ledge, and a short run last spring went \$7 per ton.

Fresno.

PETROLEUM AND NATURAL GAS.—Fresno *Republican*, Nov. 9: Great excitement prevails in the southwestern part of the county on account of the recent rich discoveries of petroleum there. The fact that oil existed in that locality has been known for several years, but the more recent developments seem to indicate that it is present in great quantities. The people of that section are wild with excitement, and hundreds of claims have been located. A *Republican* reporter visited the recorder's office and found that 96 claims had been filed up to noon yesterday. Each person claims 20 acres, and all the land thus far filed upon is located in sections 17, 18, 19 and 20, in township 19 south, range 15 east. Oil-bearing land is located as mineral land. The oil-field is situated south by southwest of Fresno City, and about 45 miles distant, in an air line. It is about 24 miles directly west of Tulare City. What is of greater interest to Fresno than the discovery of petroleum, is the fact that natural gas in large quantities has been discovered as well. Valuable as the petroleum wells will prove if oil exists in sufficient quantities, the natural gas will be of ten times greater

value. If there is indeed a good supply of natural gas, it is quite as valuable to Fresno as it would be if discovered in Chinatown. In the East, natural gas is carried hundreds of miles in pipe lines, and to convey it the short distance of 45 miles will be an easy matter. Once natural gas is found in sufficient quantity to be useful in this county, Fresno will become a manufacturing center second to none in the State outside of San Francisco. Manufacturers are what Fresno needs, and the only thing that prevents their establishment here is the scarcity of fuel. This one drawback will be done away with by the discovery of natural gas, and it is needless to say that no time will be lost in utilizing the discovery. Some of our capitalists should give this matter their immediate attention, and if there is any natural gas in Fresno county make arrangements to bring it to this city at once.

DISCOVERY.—*Expositor*, Nov. 7: Mr. Chambers has been prospecting for some time past in the ranges adjacent to the San Joaquin river, and reports a fine discovery. Picked specimens of the rock assayed several thousand dollars per ton. It is thought that the ore will run upward of \$60 per ton on an average. Harry Sherwood is interested in this property, and both the owners are hopeful of large results. Mr. Chambers is of the opinion that the mining regions of Fresno county will soon take high rank among the mineral-producing sections of the coast.

Inyo.

RICH ORE.—Inyo *Index*, Nov. 7: Chas. Walters and Sam Gruber have commenced to develop the recent discovery east of Independence depot, in the interest of the owners. It is a most promising find, well situated and in favorable formation. An assay of the ore gives 74 per cent lead and 166.20 ounces silver to the ton. Another Cerro Gordo in that vicinity would be a big thing for our county, and it is among the possibilities.

Los Angeles.

AT THE CORA BELLE.—Newhall *Times*, Nov. 10: Rudd & Helig have started up their new washer at the Cora Belle, and the prospects are that the new machine will revolutionize mining in this district. The Cora Belle claim is covered with a clayey deposit from four to eight feet deep, and is so tenacious that it is pulverized with considerable trouble, but when powdered proves very rich. Rudd & Helig's machine fits the situation exactly and is a grand success. One man fires the clay bank, while another takes it with a team of mules and a scraper to the "dump platform," it works into the machine automatically, and the capacity of the washer is about 75 tons per day. At present the men are working only 12 hours a day, but next week there will be day and night shifts, thus running it all the time, and more than doubling the present run. It is claimed that this machine saves about \$1.50 per ton over the former process, and costs \$15 per day to run it. Work on the new reservoir is progressing very nicely, and by New Year's hydraulic can commence. The production of the Cora Belle has revived much interest in mining in this district.

Monterey.

LOS BURROS MINES.—Cor. Monterey *Democrat*, Nov. 11: Of all the resources of the county, for immediate possibilities, nothing impressed me so favorably as Los Burros mines. The mines give every evidence of millions awaiting a little well-directed industry and the judicious expenditure of a comparatively small amount of capital. If these mines are not as rich as anything that has ever been found on the Pacific Coast, there is nothing in indications. The writer accompanied Supervisor Pinkerton into the mines, driving from Pleyto, via Jolon, to the station on the Nacimiento river at the foot of the mountains. This is the end of the wagon-road and 12 miles from the mines. Next morning we bestrode our horses and started up the trail. The trail is better than the average of mountain trails, and was constructed by the county at an expense of \$300, but the mountains are rough. A short distance down a canyon, toward the ocean, we found the mining camp, the town of Manchester, 8 or 10 houses built of logs and split lumber. Three saloons are conspicuous and well patronized. There is a store and hotel, and about 100 people at the camp, including three or four families. The mining district comprises eight square miles, upon which have been located not less than 500 claims. Of these, the first mine, discovered on the 24th of March, 1887, by Wm. Cruikshank, is the only one that any great quantity of ore has been taken from, although there are other mines which not only prospect well but have a large quantity of rich ore in sight. The discovery of these mines was the result of long and persistent prospecting. Placer gold and float quartz have been found all through this country for years, and Mr. Cruikshank's faith in a ledge has been rewarded by one of the richest discoveries ever made in the State. The ledge was discovered in the head of the canyon, and from the surface is very rich, showing free gold and assaying from \$150 to \$8000 per ton. The quartz vein is about three feet thick, with clearly defined footwalls, running east and west, and dipping north 45 degrees. Mr. Cruikshank has a three-stamp mill, and has taken out a snug sum. Not long since he started a tunnel which would tap the vein at a depth of 125 feet. This tunnel, at a distance of 380 feet, reached the vein and found it just as rich as at the surface. But this is not all. In the tunnel several stringers, from 6 to 18 inches in thickness, were cut, and they are as rich as the main vein. This tunnel has demonstrated two things: The permanency and richness of the prospect, and that the mountains in this vicinity are full of small gold-bearing quartz veins. In the Cruikshank mine there is enough in sight to make its owner a millionaire, with the prospect of ore of a similar quality to the ocean level, 3500 feet. Good prospects have been found over eight square miles of territory, and the ledge has been struck at a number of places, demonstrating that the precious mineral is pretty well distributed over the district. A tunnel in the Brewery mine has struck the ledge and struck it rich. The strike was made the day before our arrival. In the King mine a tunnel is being pushed with good prospects. The Bradley company has some fine prospects. The Grand Pacific adjoins the Cruikshank, and is undoubtedly very rich. But aside from the Cruikshank mine not very much work has been done. People have waited to see what would be found on the lower level, and as this strike has only recently been made, there has not since been time enough to make any further developments. But the miners are feeling jubilant and

anticipate a lively camp next spring. There are more than 20 claims that have been prospected and show up well. Nuggets have been found weighing from 10 cents to \$14. The children find gold in the gulches. There is no rebellious ore, and much of the gold has been found in decomposed quartz. My surprise in finding a camp with such prospects in this locality was not so great as it was to find so few people, comparatively speaking. Why it is that such prospects as are at Los Burros have not attracted thousands of people is more than I can understand. But one thing is certain, it will not be long before the resources of this camp will be so developed and advertised as to make it conspicuous among the best mines of the coast.

Nevada.

DEEP MINING.—*Tidings*, Nov. 8: The Mountaineer mine of Nevada district is to be given depth. It has been a profitable property, but like the other mines of its district has failed to pay after attaining a certain depth. Now sinking is to be resumed and continued until it is reasonably demonstrated whether or not good ore exists below the strata. What has been achieved in the Grass Valley district through deep sinking may be achieved in our sister district. Deep mining for quartz has in the last eight years resulted in the unearthing of millions of gold in the small area known as the Grass Valley Mining District.

CAVE AT THE MANZANITA.—*Transcript*, Nov. 8: There was a bad cave Tuesday evening of the hydraulic bank at the Manzanita gravel claim in the northern part of this city. An immense amount of debris slid down nearly to the mouth of the drifting tunnel through which the channel is now being worked. The tunnel opening is some 700 feet from the original foot of the bank, which is 400 feet high. By the cave a portion of the tunnel was broken down and about 40 men are temporarily thrown out of employment.

GOOD ROCK.—*Herald*, Nov. 5: The men working at the El Dorado mine report finding good rock in the drift being run on the ledge from the main tunnel. This ledge was thought to be a parallel one to the main ledge for which they have been running. It has widened out in the drift, which is now in 16 feet, to 18 inches. The news is very encouraging and gives the owners some consolation for all the disappointments and delays they have experienced. But the company are stayers and will yet develop a valuable mine.

WHY IT WAS CLOSED DOWN.—*Herald*, Nov. 7: The rock in the Washington mine is said to be looking better than ever, and the ledge at the bottom is of increased size, but in November and December, where the mill is located, a good deal of ice forms around the large overshot wheel, and the gold being fine, does not amalgamate as well as in the warmer weather. So as there is development work to be done, it was thought advisable to do it and stop crushing for a time.

THE BRUNSWICK MINE.—*Transcript*, Nov. 10: Mr. Murray of New York, representing the Brunswick G. M. Co., was in this city yesterday settling up the judgments lately obtained against the company by Edwin Tilley and H. Silvester. These amounted to about \$2300, including costs. Mr. Murray thinks his company will resume operations at an early day.

COE MINE.—*Grass Valley Union*, Nov. 11: An agreement has been made by the owners of the Coe mine with the agent of Eastern parties to bond the property, with the privilege of its ultimate purchase. All the terms have been agreed upon, and it is expected that in a few weeks operations at the mine will be resumed.

Shasta.

IRON MOUNTAIN.—Shasta *Courier*, Nov. 10: The Lost Confidence mill and reduction works will start up next Monday, all needed repairs having been made, a large supply of fuel procured, and any quantity of good milling ore out ready for reduction. The second shipment of ore from the Little Nellie mine, Iron Mountain district, was made last week, the ore assaying splendidly. Mr. Everett, the superintendent, is very sanguine over the prospects and workings of the mine, and the impression is general that Deputy Sheriff Buckley of Sacramento made a good investment when he purchased the mine a few months ago from Oliver Boyd. The work of running a tunnel to tap the ledge on the Dow & Haskell mine is steadily progressing, and we expect to soon hear of the ledge being tapped at a depth from the surface that will make the taking out of an immense quantity of good milling ore an easy and comparatively inexpensive task. We are informed that the developments in the Little Nellie mine and the bullion yield from the quartz has led the owner to determine to put up a mill as soon as possible, and thereby save the expense of shipping ore.

WATER-POWER.—*Redding Free Press*, Nov. 9: The advantage of water-power over that of steam is now proved conclusively in the Calumet mine, about six miles above here, its capacity being increased nearly double, and the steadiness of the motor causing a great saving in wear and tear of the machinery. The bridge suspended across the Sacramento river, upon which the immense pipe is laid which conveys the water from Spring creek to the mill, is not only noticeable for strength and beauty, but for its advantage to the neighborhood, it being constructed in such a manner as to be used as a foot bridge with perfect safety.

Siskiyou.

QUARTZ.—Yreka *Journal*, Nov. 7: Mr. Charles Abbott of Greenhorn Creek will soon commence hauling quartz to Warren's mill on Yreka Flats for crushing. He has nearly 20 tons of rich-looking quartz, some of which shows a great quantity of gold to the naked eye. He has pounded out enough all summer in a mortar to pay expenses, and if the rock averages anything near the prospects realized, he will make quite a stake. Heckathorn & Co., who also have a rich ledge on Greenhorn, are now building an arastra, which they expect to use in crushing quartz on hand as soon as the winter storms commence to supply sufficient water. Rich mines of gold and silver are reported as having been discovered in the mountains west of Edgewood, and it is probable that good-paying mines exist in the dividing range of mountains between Shasta and Scott valleys, all the way from Yreka to Mount Shasta. Jo Cavanaugh of Edgewood showed us a fine specimen of galena found in the hills west of Edgewood, which is rich. Several specimens of this ore have been found, and it is believed good ledges exist, for which he has men out prospecting. It is also re-

NEVADA.

Washoe District.

SEGREGATED BELCHER.—Virginia *Enterprise*, Nov. 10: The 1100 station is now repaired and are ready to start the joint east drift as soon as they can get the rope down in the incline.

BEST AND BELCHER.—300 level.—In west crosscut No. 1, at a distance of 120 feet from main north-west drift, the winze has been sunk 23 feet. Total depth, 45 feet. Formation, quartz and porphyry, showing some value. From the bottom of the winze a south drift has been started and advanced 12 feet. Formation, quartz and porphyry, showing some value. South drift from top of winze has been extended 11 feet. Total length, 40 feet. Formation, porphyry. 625 level, main north drift, has been cleaned out and repaired a distance of 525 feet.

HALE AND NORCROSS.—On the 500 level the west drift has been advanced 15 feet; total distance, 545 feet. The north drift has been extended 30 feet; total distance, 160 feet. The north and south prospecting drifts from the 15th floor have been advanced respectively 20 and 18 feet. On the 800 level the north drift has been advanced 22 feet and the south drift 40 feet. Have men on repairs in the shaft stations and on the several levels of the mine, and are preparing to resume shortly the extraction of ore.

SAVAGE.—On the 400 level the southeast and northeast drifts have been advanced respectively 20 feet. From the north and south drifts on this level are stopping ore. On the 500 level are stopping ore of good quality from the east crosscut. Car samples average \$45 per ton. No. 2 east crosscut on this level has been advanced 24 feet. On the 950 level the east crosscut has been advanced 20 feet, and has broken into the old stopes. From the several levels are extracting about 60 tons of ore per day. Shipped in bullion this week \$7775.33.

GOULD AND CURRY.—200 level.—West crosscut from the top of the upraise from El Dorado (300) level has been extended 16 feet; total length, 114 feet. Formation, quartz and porphyry, giving high assays. 450 level.—At a point 60 feet from top of upraise, from the 500 level, a west crosscut has been advanced 30 feet. Formation, clay and porphyry.

BELCHER.—The 200 north drift is now in 126 feet, having been advanced 24 feet during the week. The 160 south drift to meet it was advanced 15 feet. Repairs to the pump compartment are progressing satisfactorily. Will get the rope in the incline in a few days, when the 1100 joint east drift can be advanced.

CHOLLAR.—The west drift from the shaft on the 850 level is in 66 feet; the face is in quartz and clay. The west drift from the shaft, 750 level, is in 217 feet. The face is in porphyry. The north drift, 450 level, is in 712 feet; the face is in quartz of no value.

BALTIMORE.—Have considerable good ore on the dump, extracted from the northwest and southwest drifts on the 300 level. Everything is working well, and hopes are entertained of striking a good body of ore.

ALPHA.—The 500 level north lateral drift is in the north of the shaft 155 feet; the face is in quartz and clay. The south drift, same level, is in 68 feet; the face is in quartz that yields assays from \$10 to \$30 a ton.

CROWN POINT.—The south crosscut (No. 2 west, 700 level) has not been advanced, the week having been occupied in retimbering and cutting a drain. Started the drift on the 800 level Wednesday.

ALTA.—The work of development of the ore body struck on the 900 level is progressing fast. The 825 level is yielding its usual quantity of ore, which is being concentrated at the mill.

POTOSI.—The south drift, 65 level, is in 558 feet; the face is in quartz and porphyry. The east crosscut No. 2, 650 level, is in 65 feet; the face is in quartz, some of which yields good assays.

EXCHEQUER.—The north lateral drift, 372 level, is in 492 feet. The face is in porphyry. The east crosscut, 200 feet north of the south line, is in 17 feet; face in clay and porphyry.

SCORPION.—No change to report in the progress of work in this mine. Are still crosscutting west on 300 level.

JUSTICE.—Work on the new mill progressing satisfactorily. Ore reserves continue to look well.

ANDES.—Running the north lateral drift on the 350 level, and sinking winze on the 240 level.

YELLOW JACKET.—Shipping white rock gold-bearing ore to the Brunswick as formerly.

BULLION.—There is nothing new to report in the work on the 500 and 600 levels.

OVERMAN.—Prospecting below the tunnel level continues.

KEYSTONE.—Drifting southwesterly on the 300 level.

Eureka District.

BULLION AND LEAD.—Eureka *Sentinel*, Nov. 10: During the week the Richmond Company has shipped 60 tons of silver-lead bullion, and the Eureka Con. Company has shipped 15 tons of lead.

ORE SHIPMENTS.—During the last week ore shipments were made from the following-named mines of the district to the furnaces: From the Hamburg mine, 94½ tons; Jackson, 134 tons; Dunderberg, 88½ tons; Paymaster, 3¼ tons; Climax, 4½ tons; and the Ethel, 1 ton.

Pioche District.

YUBA.—Eureka *Sentinel*, Nov. 10: The Yuba mine employs 30 men and continues regular shipments of high-grade ore. The work on the mine is mainly exploratory, the main bulk of the ore being left in the mine for better facilities which the railroad will bring.

Tuscarora District.

GRAND PRIZE.—*Times-Review*, Nov. 9: The water is now down to within a distance of 13 feet of the floor of the 400-foot level station.

COMMONWEALTH.—100-foot level: Upraise from west drift has been carried up 70 feet in vein matter showing some ore. No. 1 winze from east lateral drift has been sunk 8 feet through hard rock with

seams of ore mixed through. North drift from joint crosscut has been advanced 15 feet. Intermediate drift from top of No. 4 chute has been extended 12 feet. 150-foot level: No. 2 winze from east lateral drift has been sunk 6 feet. Work at this point has been suspended until crosscut can be run from 225-foot level. Upraise from No. 3 north drift has been extended up 20 feet, all in vein matter. 225-foot level: Main south drift has been advanced 14 feet.

NEVADA QUEEN.—No. 1 north drift, 450-foot level, has been advanced 10 feet in vein matter showing some sulphurets. The stopes above the 350-foot level have yielded the usual amount, but stoping has been suspended, as the mill has to be turned over to the Navajo company on Monday, 12th, and is being cleaned up. Prospect work will be resumed at various points throughout the mine. Will ship bullion from cleanup on Monday.

NAVAGO.—South drift from east crosscut on west vein, 350-foot level, has been extended 12 feet. South drift from No. 4 crosscut, same level, advanced 12 feet. The usual progress has been made in all the other workings. The force in the stopes has been increased during the week, and the extracting of ore for milling has been commenced. The stopes are looking well at all points. Commence milling Monday.

NORTH BELLE ISLE.—East crosscut, 300-foot level has made fair progress. South intermediate drift from No. 1 winze, 300-foot level, advanced four feet. The face shows about two feet of concentrating ore. Crosscut west, 400-foot level, extended ten feet; total length 18 feet. Some work has been done in the stopes above the 400-foot level. The work on the Union mill is progressing rapidly.

NORTH COMMONWEALTH AND DEL MONTE COMBINATION SHAFT.—Sinking has been suspended pending the erection of the hoisting works. Excavation for the foundation of the engine is completed. Work on the building will be pushed rapidly.

BELLE ISLE.—East crosscut from north drift, 250-foot level, has been extended 14 feet; total length, 230 feet.

FOUND TREASURE.—The timbers in east drift, 150-foot level, are being cased and many of the old timbers are being replaced by new.

ARIZONA.

DIFFERENT DISTRICTS.—Prescott *Courier*, Nov. 7: John Hutchins, Hughey Hughes, Geo. Burton and other miners of Groom creek were in Prescott yesterday. Most of the miners of the district are taking out good ore. Jones' mill will start on another run in a few days. Dan O'Boyle, owner of the Montgomery group of mines, continues to get good pay out of his ore in an arastra. Frank Kuhne is shipping about 100 tons of ore a month from the Belle mine, Walker district. It pays well in gold. Mr. Thompson, superintendent of the United Verde mines and smelters, has been examining properties south of Prescott. His mines and smelters are O. K. Geo. Zika has ore en route to the Ore Co.'s works from his mine in Lower Turkey creek. Geo. Wickler has a shipment ready at his White Spar mine. Frank Alters would be happy if he could get a pack train to bring in rich ore from the Catacino mine. He has "dead loads" of it. Messrs. Dunkle & Fisher have erected new hoisting works on their mine in Turkey creek district, and will now prospect it to a great depth. Geo. B. Ridenour is shipping good ore from the Delta mine, Hassayampa district. Holliday & Co. will shortly ship a big lot of rich ore from the Dosoris. John McDermid says placer miners of Lynx creek are taking advantage of the water and are washing considerable gold out of the gravel.

NICKEL MINE.—Phoenix *Herald*, Nov. 3: Billy Everett, who has been out in Tonto Basin for several months, returned this morning the happy possessor of a large and valuable nickel mine, which he discovered on the very summit of the Sierra Ancha. He has already received returns from Prof. Dewey of the Smithsonian Institute, to whom he sent some samples, informing him that the ores contain nickel, cobalt and bismuth. To-day he shipped by request 20 pounds of ore to the same professor, who will return him a perfect analysis of the contents. The ledge is six feet in width. Frank Kline of Tonto has claimed an extension.

COLORADO.

WINTER WORK.—Elk Mountain *Pilot*, Nov. 11: It is too bad that the Eastern people interested in our country do not commence early enough in the fall to make preparations for winter work. They are too apt to put it off too late. Mine work can be carried on to a better advantage in winter. The Runoee boys have struck some fine ore on Galena mountain. The Anthracite mine is again running on full time, we believe. The Copper Queen mine, in Silver Queen basin, will be worked all winter by Jake Goodwin. The development will be in driving the tunnel ahead under the ore chute. The tunnel is now about 200 feet long and will have to be driven from 75 to 100 feet before the vein is cut. The ore on the surface is gray copper, different from anything ever before found in the country, and will run from 25 to 35 per cent copper and about 200 ounces in silver. Supplies are being put in at the Shakespear mine for about four men to work all winter. Jerry Madden has completed a new house on his claim, and is getting ready to work all winter. He has a good showing on his claim, situated in Bonanza gulch. Messrs. McGulloch and Cameron are over in Dark canyon working the assessment on the St. Elmo lode. Mr. Ger expects them out any day, and as they are not supplied with snow shoes he had to send J. C. McQuarrie over with snow shoes in order that they can come out.

ZINC.—Georgetown *Courier*, Nov. 9: A new company for the mining, buying and reduction of zinc ores has been organized in Denver.

CONCENTRATORS.—Harzlet & Co. have been overhauling and remodeling their concentrating works preparatory to winter work. They have so arranged their works that nearly everything is done automatically, hence cheaply. The ore passes through two crushers and the coarser material from the second crusher goes under the stamps, all of which is carried by buckets to the concentrating tables. About 10 tons of ore are concentrated each day, and the results are highly satisfactory. We hope to see the entire Clear Creek mill converted in-

to concentrating works next summer. Capital, with the practical experience of those engaged in this enterprise to back it, would be well invested in such a scheme.

GOLD.—Clear Creek county deposited \$9006.29 in gold at the Denver mint during the month of October. Zorquite, a mineral composed of selenium, lead and copper, is found in the Pearl lode, San Juan county. The Whiting mine at Central recently had a gold brick cast at the Denver mint, valued at \$39,219.91 in gold and \$362.54 in silver. A mill-run of ore from the Cashier lode near Argentine pass, returned 145 ounces silver per ton and 13 per cent lead. The Cashier is owned by J. P. Williams. The 800-foot adit on the Queen, Argentine pass, is being driven ahead for the purpose of connecting with the shaft for ventilation and opening ground containing their best ore.

NATIVE SILVER.—Considerable native silver was struck in the Washington lode, Silver Creek, last Saturday. The vein shows a large streak of quartz liberally mineralized, which is believed to be paying ore. The lode is being worked by Bond, Johnson & Maxwell. Following is the statement of ore sampled and sold at the public ore market during the three months ending Oct. 31: 1,966,800 pounds, containing 282 ounces gold, 117,810 ounces silver, 126,398 pounds lead, 4066 pounds copper. Total assay value, \$122,181.

DAKOTA.

GALENA SMELTER.—Deadwood *Pioneer*, Nov. 6: The long-looked-for coke has at length arrived and fires were last night started in furnaces of the galena smelter. Ore will be put through this morning, and by night the first bullion will have been produced. The bins are full of ore received from the Queen, Horseshoe, Bullion, Ontario, Hayes and other properties. An experienced miner in the city yesterday expressed the belief that the smelter will have a successful career. It is in the hands of practical men, thoroughly acquainted with the resources of the camp, who had carefully weighed the question before deciding to start the plant up. The mines are capable of furnishing twice the quantity of ore required to keep the plant running, and doubtless it will not be long after this is demonstrated a success before another and larger smelter is put up.

SILVER PLUMAS.—The Silver Plumas name must be added to the list of companies producing gold bullion with monthly regularity. Operating only a 20-stamp mill, the September cleanup amounted to \$7800. That for October is even better than this. Supt. David Hunter came down yesterday, bringing with him two bricks valued at \$8000 and representing operations for only 20 days of last month. The amount is flattering, all things considered, and indicates that the ore treated must be rather higher in grade than the average on the belt.

FLOAT.—Bullion from the belt mines, aggregating in value about \$150,000 and representing cleanup for the last two weeks of October, was brought down yesterday and deposited in Wells, Fargo's express office for shipment East to-day.

IDAHO.

FLORIDA MOUNTAIN.—Idaho *Avalanche*, Nov. 7: W. H. Dewey is working quite a number of men on the Back Jack mine, on Florida mountain. This property should be in the hands of men able to put up a 100-stamp mill. Men who know the several properties owned by Mr. Dewey best, and who have walked through the 7000 or 8000 feet of tunnels in the group, all agree that there are enough tons of good ore in sight to keep such a mill running for years. Mark you, Silver City has not seen her best day. The two mountains which obscure the rising and setting sun from the town are storehouses holding a surplus, which, if it were the "condition to confront" by the Government, would make the reduction proposed by the Mills and Senate bills look insignificant.

ROTTEN GRANITE.—The little "Granite Quarry," near the Morning Star mine, recently discovered by Geo. Stoddard, is an anomaly to miners. It is a series of very rich stringers in rotten granite. These stringers are from half an inch to two inches wide, and there is upward of 100 of these in a distance of about 30 feet. By assorting close he takes out about 500 pounds of ore per day, worth about \$125 per ton. He works it alone, but it looks like it will last, in fact is daily growing better. It promises to be a big mine, and all of George's friends, which means everybody who knows him, hope it will prove all that it promises.

SILVER CITY.—Idaho *Avalanche*, Nov. 8: Anticipating a big output from the mines on War Eagle and Florida mountains this coming winter, all freight haulers are laying in larger supplies of hay and grain than have been brought to town for many years; our merchants are purchasing bigger stocks of goods; the mine boarding bosses are piling up unusual amounts of supplies, and the woodpiles at every mill are bigger than they have been since they were built. These facts are mentioned to show that our own people have faith in the continuation of the prosperity which now makes Silver City happy.

ORO FINO.—The Oro Fino rich strike continues rich as they drift into the chute of ore. There is every reason to believe that it will prove to be 400 feet long, with a good deal more than a million profit in it. The Poorman people have contracted with the arastra mill for the crushing of enough ore to keep the mill running night and day until the robins come again, and are sure they have enough ore in sight to keep up a steady gait for a year at least.

MINERS.—Several new miners arrived in the camp this week and found work at once. It is not a gracious thing to state in a paper with so wide a circulation as the *Avalanche* that more miners are needed, because we are a long distance from other mining camps and may cause more to come than can find work. Nevertheless quite a number more than now here could find work at once.

MONTANA.

COKE AND COAL INDUSTRY.—Bozeman *Courier*, Nov. 6: The business of manufacturing coke at Cokedale is developing into quite an industry. Work has commenced on 13 new ovens, which, when completed, will make a total of 40. These turn out an

average of a ton of coke a day. The ovens are built to take charges of five tons each, and the coal is allowed to burn 72 hours. Coke can be made in less time—considerable having been made by burning the coal 48 hours—but it has been found that the coke made in 72 hours, where a lighter draft is used, is of superior quality. About 100 men are now on the pay-roll of the company. A test of the Horrocks coal has been made at the Cokedale ovens and has made coke of excellent quality. It is rumored that the entire output of the 11 or 12 mines will be taken by the Helena and Livingston Smelting Co., part of it being made into coke at Cokedale. The seam of coal at the Chestnut mine, which is now being worked by Frank Esler, is 11 feet in thickness and the coal comes out in large pieces. That used by persons in the city is said to be superior to any heretofore received from that mine and gives very general satisfaction.

GRANITE MOUNTAIN.—Phillipsburg *Mail*, Nov. 7: The output for the week ending Nov. 7, was 36 bars of bullion, containing 55,550 ounces silver and 22,26 ounces gold. The small output this week was occasioned by the shut-down of mill A for two days during the week.

ROCK CREEK DISTRICT.—This is a mining district about 16 miles from Phillipsburg, which, outside of a few cases, is practically unprospected. The exceptions are certainly few, but the result seems to have been flattering to the few who have had the hardihood and confidence to explore and prospect that rugged and rich mineral country. The district lies between Rock and Willow creeks, and is about as rugged and uninviting a country as a person would be likely to see anywhere. The ledges are quite rich and very extensive and are just beginning to attract some attention.

DORA THORNE.—While little is being said about this property, work is going on with all possible rapidity. Sinking on the Little Turf is making good progress and is improving as they go down. They now have seven men at work and will put on more as the mine is opened up.

SYDNEY CONSOLIDATED.—The Sydney follows suit with the many other mines that have been reported lately as making valuable discoveries. Last week a new iron vein was struck in this mine which will greatly add to its value.

NEW MEXICO.

TAILINGS.—Silver City *Enterprise*, Nov. 9: C. P. Crawford is engaged in concentrating the tailings at the Mimbre mill after they have been run through the concentrators a couple of times. He is doing very well; saving several ounces of silver to the ton. The returns of the last shipment of Black Hawk ore were received last week by McQuarrie & McGregor. It ran very well and was treated at the El Paso smelter. The Black Hawk, worked by such level-headed, practical miners as the present leasers, is bound to make a good showing. P. Stewart, manager at Telegraph, was in town last week on his way East, where he expects to remain about two weeks. He stated the mines were looking better than at any time since work was commenced upon these claims. Splendid-grade ore has again been struck in the Tescumseh tunnel at 250 feet, and stoping will be resorted to to get enough out to keep the mill running. Telegraph is yet liable to forge to the front. John A. Miller is reported to have invented an ore-concentrator that when put in operation will be generally adopted in mills having rebellious ores to treat. Mr. Miller is in the East at present engaged in perfecting arrangements for the manufacture of his concentrator and the organization of a company to introduce and build them.

OREGON.

CORNUCOPIA.—Cor. Union *Republican*, Nov. 7: With the excitement about and around, over mining camps starting up in all Eastern Oregon, each with its peculiar advantages, one almost loses sight of Cornucopia. Not that it has passed its usefulness or that it is less important or lacks that grand equivalent, the most desired mineral. But the excitement and visionary has given way for the sober, thoughtful and substantial. That we have ore here in large and lasting quantities is shown more and more by each foot of depth attained, and that it improves with depth has been proved at least to some 400 feet. That the ore is of paying quality, the great question on which the continuance of all operations is based, has been shown by the work at the Eagle mill, the property of the Oregon G. M. Co., of Louisville, Ky., under the supervision of Mr. A. E. Smith. I left Cornucopia some time ago as quiet, dull and unpromising as you could well imagine, and after a somewhat informal journey, I visited many of the now "bouncing" mining camps of Eastern Oregon, all of which are in their first excitement, their substantial qualities only visionary, many very promising, others dull; but on my return here I find a change has come to Cornucopia. I can now hear the roar of the 20 stamps at the Eagle mill, which seem to say again and again, "One thousand dollars a day," the screech and grit of the ore-wagon coming down the grade with its loads of four tons of fine ore for the mill and back for more, a general liveliness about everything and every one that helps his confidence amazingly. Not only is this stir confined to the O. G. M. Co. but I could mention many properties that are exceeding expectation. A very careful and thorough examination of the mines of the basin is being made on behalf of some capitalists of the Northern Pacific railroad.

EASTERN OREGON COAL MINES.—Bedrock *Democrat*, Nov. 7: Work is going on apace at the Dry Hollow coal mines on John Day river, near Fossil, under the supervision of the superintendent, C. S. Miller. Messrs. Peterson & Panning are engaged on the work. They have excavated quite a considerable distance under ground, and are following up the different ledges with the most sanguine expectations of striking coal in large quantities. The coal taken out is of very excellent quality, representing what is known as the Kendal coal, found in the North of England, and is suitable for almost any purpose. It burns well in stoves, and throws out a strong body of heat.

SOLD HIS INTEREST.—An important transfer of an interest in the Worley mine, near Robinsonville, took place last week, by which Mr. L. H. Bowman of Walla Walla secures the interest of Andrew Hamilton and pays therefor a consideration of about \$3000; part cash, the balance in three-year-old

mares, the pick of a band of 300. Messrs. Hamilton & Bowman are now in Walla Walla closing up the bargain. This makes Mr. Bowman an equal owner in the mine with W. J. Wolfe and puts the property in shape for permanent operations in future. Already these preparations have been made and several teams loaded with freight and supplies for the mine are now on the way. Work will be pushed all winter, and in the spring it will be determined whether or not to put up a mill of sufficient capacity for successful working of the ore.

THE ELKHORN.—The Elkhorn mine is an extension of the well-known Baisley Bros. mine, situated about 15 miles west of this city. It is owned by J. H. Robbins & Son of Portland, who have had a force of men developing the property for the past year until now it gives every promise of being a valuable and permanent mine. We learn from one of the owners that it is their intention to ship one or more carloads of the ore the coming week to Denver for reduction, and if satisfactory results are obtained, of which they are certain, they will continue shipping until the snows of winter put in an objection. In the spring a mill will be placed on the property and the owners feel confident they will obtain handsome results.

UTAH.

CAR FORK, BINGHAM.—Salt Lake *Tribune*, Nov. 11: Car Fork, Bingham, is coming to the front through work being done by the Stewart No. 2 Co., together with operations of the Last Chance Co. The Stewart No. 2 put in some Huntington mills last spring to crush their gold rock, and the machinery is working satisfactorily. There is an unlimited amount of free gold ore, in such a large mass as to be mined as easily as quarrying line rock. There are some sulphurets present in this ore, but it is so free as to be economically worked, and is so far above the mill as to be dropped into it at a very small cost of mining and delivery to the crushers. About 2000 feet up the gulch from the Stewart property is the mouth of the British Tunnel, which has been driven 2700 feet to tap the Last Chance lode at a depth of 1000 feet, where it intercepts the main shaft. This is a fine working tunnel which cost the company something over \$40,000. Besides giving exit for ore and waste from the mine, this tunnel drains the property, besides a large space of country around, sending out a stream of fine, pure water. The Last Chance was opened in 1871, and has been worked more or less ever since. It has produced about \$1,000,000 from a short space of ground, above the 500-foot level. The mine has six levels down to and including the 500-foot level, and has been worked through the main shaft and the two crosscut tunnels, one at 250 and the other intersecting the 500-foot level. These crosscut tunnels are, respectively, 250 and 900 feet long. This lode is a typical one for Bingham, being in syenite, regular in its course and dip, its general trend being northeast and southwest, with a dip of 40 degrees from vertical, toward the southeast. The lode has been opened continuously on the Hooper, Last Chance, Northern Last Chance and Steamboat, a distance of nearly one mile. The ore runs from 30 to 100 ounces silver, 18 to 40 per cent lead and \$5 to \$20 in gold, the average being about \$50 per ton in market value. It varies in width from 10 to 50 feet. The Last Chance Co. lately contracted with the Utah & Montana Machinery Co. for a complete crushing and concentrating mill with a capacity of 50 to 60 tons per day, and this mill will be ready to turn on steam by the last of this week. The mill is located at the mouth of the tunnel, where, as has already been stated, there is an abundance of water. This property belongs to an English company with George Cullen as local director and manager. A mining force has just been put in the mine on the tunnel or 1000-foot level to extract ore to supply the mill. The company was reorganized this season, when the name of the company was changed from Last Chance to the New Chance Mining Co., Limited, but this does not change the name of the mine which has so long been a landmark in Bingham. When this change was made the capital stock was increased and money raised to put up the mill and make developments, thus placing the company and property in excellent condition.

PARK NOTES.—Record, Nov. 10: Most of the mining companies paid off this week. Ontario stock is held at \$31.50 to \$32 per share; Daly, \$16.25; Anchor, \$5.50; Southern Tier, 75 cents; Crescent, 35 cents; Apex, 30 cents. The stock market is quiet and inactive now. The two cases of P. F. Brennan et al. vs. Nalley Moray et al. were decided in the Third District Court, Thursday. The action involved title to mining ground in and near the Putnam group, and findings and decree were for the plaintiffs. At the sale of the late Jas. H. Bowen's mining claims, John H. Rogers was the highest bidder. The locations were almost without number and nearly all were "jumpable." The sum paid was \$25 for a fraction of a claim, and all of the balance of the locations went as nothing. Assessment and development work is being done on the Berry & Dorsetta claim, owned mainly by Jas. Berry and P. F. Brennan. The property is on the ridge between the Anchor and Sampson. The tunnel is in 30 feet southward. It will be continued in the hope that the present favorable indications may lead up to the vein.

ORE AND BULLION SHIPMENTS.—During the week the Crescent shipped 193,000 pounds of concentrates. For the week just ended the Mackintosh sampler received 196,350 pounds of Ontario ore, 117,520 of Woodside lease, and 86,510 of Daly ore; total, 400,380. Last Tuesday, 12 bars of Daly bullion, 10,461 fine ounces of silver, were shipped from the Marsac mill.

WASHINGTON.

SILVER.—Spokane Valley *Herald*, Nov. 7: A short time since a discovery of what gave promise of being an important and valuable silver ledge was accidentally discovered in a railroad cut near the fair grounds by a party who was looking around the cut. He kept the matter quiet and sent to Montana for a mining friend who arrived a few days ago and prospect the discovery. The ledge is said to be five feet wide and 20 feet deep, assaying 37 ounces of silver to the ton. Local parties are interested in the development of the claim who have had considerable mining experience, and who have some idea of what they are doing, and it would not be at all surprising if this ledge proved to be a rich find.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

And is everywhere recognized as the standard for high-pressure service.

UPWARDS OF 600 IN USE.

From 12 to 20 per cent better results guaranteed than can be produced from any other wheel in the country.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRICAL TRANSMISSION.

Power from these Wheels can be transmitted by electricity long distances with small loss, and made available for running Mills, Pumping and Hoisting Works, Tram cars, Electric Lights, etc. Address:

The Pelton Water Wheel Co.,
No. 120 FIRST ST., SAN FRANCISCO, CAL.

WINCHESTER HOUSE,

44 Third Street, San Francisco, Cal.

This Fire-proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

Laundry Free for the use of Families
HOT AND COLD BATHS FREE.

Terms, Board and Room, \$1.00 per Day
And upward.

ROOMS WITH OR WITHOUT BOARD.
FREE COACH TO THE HOUSE.
J. POOLEY.

LIGHTNING WELL-SINKING MACHINE MAKERS.

Well-sinking and prospecting tools sent on trial. 50 feet has been sunk in 8 hours. Instructions for beginners. An Encyclopedia of 800 Engravings of well and prospectors' tools, pumps, wind and steam engines. A treatise on gas and oil. Book free, mailing charges 25 cts. each.

The American Well Works,
AURORA, ILLS., U. S. A.

STORAGE

We have some extra room suitable for storage purposes, which we will let on very reasonable terms.
DEWEY & CO., 220 Market Street, San Francisco, Cal.

ARE YOU GOING

TO PUT UP MACHINERY OF ANY KIND?
TO MAKE ANY CHANGE IN MACHINERY?

ARE YOU FREIGHTING BY TEAM OR PACKING ON MULES?

DO YOU WANT PULLEYS ON SHAFTING ALREADY UP?

If so, don't fail to look into the merits of

THE DODGE PATENT INDEPENDENCE
WOOD SEPARABLE
Or SPLIT PULLEYS.

They are the Lightest, Strongest, Best Balanced and Most Convenient Pulleys Made in the World.
Entirely New and Original.

Adapted to any power required. Time, trouble and money saved by using these pulleys. Price List and Catalogues mailed free.

JOHN SIMONDS, Pacific Coast Agent,
509 to 513 Mission St., - - SAN FRANCISCO

SQUARE FLAX PACKING.

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for Water and Steam. Packs with less friction and makes a tighter joint than any other packing made. As imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all Hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

THE "ECLIPSE"
Copying Apparatus.

One thousand copies in black. No special pen, no special paper, no stencil required. The "Eclipse" reproduces the natural handwriting so exceedingly faithful that in most cases "Eclipse" circulars have been taken for ordinary written letters. Specimens and circulars on application.

FELIX F. DAUS & CO.,
698 Broadway, New York.

THE ROLLER ORE FEEDER

(Patented May 28, 1882)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,
Sole Manufacturers,
227 First Street, San Francisco, Cal.

ASTRONOMICAL TELESCOPE for sale cheap. Ten-inch glass, very fine. Equatorial mount. F. M. B., 257 S. Market, Springfield, Ohio.

THE JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. | D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish Single-Jointed Giants when required. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent on application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

HOSKIN'S
IMPROVED
ONE-JOINTED

HYDRAULIC MACHINE.

The statement of Mr. Joshua Hendy that any style of machine is an infringement on any style manufactured by him, he knows to be absolutely false. The Supreme Court of the United States on March 19th decided that the pretended patent for infringing, which he has for years been fleecing miners for royalty, is absolutely void, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. R. HOSKIN, Empire Foundry, Marysville, Cal.

HOISTING ENGINES
FOR MINES.

1, 2, or 4 Drums, with Reversible Link Motion or Pat. Improved Friction.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Nov. 15, 1888.

Trade the past week was generally good in all lines. The market on metals is steady, with a firmer tone in lead. Money continues easy, with a gradual increase in the deposits. There is a growing impression that larger sums than ever before will be disbursed in next month for taxes. This is made quite certain from the fact that each county and incorporated town reports a very large increase in taxable property. The disbursements in January, 1889, for interest, dividends, etc., it is claimed will be all of from 25 to 33 1/2 per cent more than was paid out in January, 1888. To meet these requirements considerable money will have to be drawn out of general circulation, which may have a temporary effect in certain quarters on the money market. The sending to Europe by one of our leading iron works to have certain work done, owing to its relative cheapness, together with the determination of the owners of the steamer Australian to have two new boilers for the vessel made at Victoria, owing to its being done at a less cost for the ironwork, is awakening attention to the fact that unless we get iron cheaper or else labor cheaper, a large amount of work that should be done here will be sent to foreign countries.

SILVER—On Saturday the price of silver fell to 93 3/4 to 93 1/2; at the latter price a sale was made on Tuesday, a further decline of 1/4 was established; at the decline some few consignments changed hands. The offerings are light, and to have urgent wants met, an advance would have to be paid. The buyers in the market the past week were the Hong Kong and Shanghai bank and the Anglo-California bank. Since our last, advices have been received that the Peerless mine in the Quijotoa district has been added to the silver-bullion producing mines. The output will, it is claimed, aggregate about \$20,000 a month. The Navajo mine in the Tuscarora district is being worked. What the output from this mine will be it is difficult to say until after the first two cleanups. With water supply before the close of the month in that district, concentrators will be at work and the silver output increased. From the Comstock district the silver-bullion output will be increased by the milling of the ore from the Confidence mine, to which will be added at an early day, probably before the end of the week, the milling of ore from the Yellow Jacket, Hale and Norcross, Savage, Potosi, Chollar and two or three other mines. All that is now wanting is water-power, and this will be had with an early rainfall. The active prospecting work going on in several of the mines points to more being added before long to the ore-producing list.

London cables received to-day report silver steady at 43d. The New York market is quoted at 93 3/4. In this market 93 3/4 was bid to-day and refused.

QUICKSILVER—The price has receded to \$43 per flask, at which figure a good trade, both home and export, is reported.

LEAD—The market, as usual at this season of the year, is dull. Cannery and large consumers are not disposed to anticipate wants, and therefore are not contracting for future delivery.

COPPER—The market is steady but firm. All present information is confirmatory that work is being done in several mines on this coast to make them producers. The Calumet and Hecla mine's output in last month was 3900 tons of mineral—the largest monthly output on record.

TIN—For spot, to arrive and also prompt shipment, the market is dull. Large consumers appear to have contracted for the more urgent necessities and are disposed to await developments. The market has an easier tone.

BORAX—The New York Commercial Bulletin, Nov. 2d, says: The borax market under the "pool" influence has had another "rise" on the Pacific. The managers of this "combine" have advanced their ideas to 6 3/4 for concentrated, 7 1/2 for refined and 7 3/4 for powdered, all f. o. b. San Francisco. In offering at these prices to the public, shipments of the two former are not guaranteed before the 15th instant, and the latter not previous to December 16th, and sight drafts are then drawn on the buyers that have to be met upon receipt of documents. It is just one year this month that the combination was formed, and those interested have certainly good cause to feel satisfied with the results obtained, as the value during that period has shown a steady advance. In this market holders are quoting 8c for concentrated, in quantities for carload lots, 8 1/2c for refined and 8 3/4c for powdered. The estimated stock, which is closely controlled, is said to not exceed 60 tons concentrated and 40 tons refined. The demand, which is quite active at present, is largely from manufacturers.

IRON—The market is reported dull for both spot and to arrive. Large consumers are only tempted to buy freely by concessions in asking prices which holders are slow in doing. It is generally claimed that the present dullness will be followed by an active season next year, owing to many contemplated buildings going up soon after the winter rains.

COAL—The market continues to hold to strong prices, but with no further advance likely to be made. The yards are cleaning up better. Two cargoes of English coal arrived the past week. Heavy shipments will soon begin to be made from Australia to this coast. The consumption of coal is steadily increasing.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Nov. 15, 1888.—The following are the closing prices the past week:

	London	Silver	Copper	Lead	Tin
Thursday	43 1/2	94	87 1/2	53 70	822 00
Friday	43 1/2	94 1-10	17 55	3 75	22 40
Saturday	43 1-10	93 15-16	17 45	3 75	22 50
Sunday	43 1/2	93	17 50	3 70	22 45
Tuesday	43 1/2	93 1/2	17 50	3 70	22 35
Wednesday	43 1/2	93 1/2	17 45	3 70	22 30

The market closed as follows: Borax is steady at

the recent advance. Quicksilver is quoted at from 63 to 65 cents. Lake Ingot copper is nominal at 17 1/2. Casting brands \$16 to \$16 1/2. The trade obtains its supplies of pig lead at \$3 3/4 to \$3 1/2. Petroleum refined, in barrels, is selling at 7 1/2; in plain cases at 9 1/2.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

TIN—Opened on Monday fully steady, but sagged off each day until yesterday afternoon, when the recovery in London stimulated a slight advance here. Spot had lost 35, and futures 20 to 30 points from the highest, but the subsequent improvement reduces the net loss to 20 and 10 and 15 points respectively. Considerable attention has been paid to the calls, but there has been only one sale reported.

COPPER—Began also to take on more life, without as yet assuming the dignity of an active market. No business whatever has been accomplished on the floor, making the first absolutely blank week this year; yet the tentative disposition to trade has been so much improved that the market may be considered as really brisker. The tendency has been toward a lower level, asking prices being reduced while bids were not advanced to meet them until firm cables were received; but the movement has been very slight.

LEAD—Declined to 15 points at the opening, and continued dull and heavy until Thursday, when a spurt upward was made on free buying, followed by a moderate reaction with a quieter market. Sales for the week are 482 tons in all, nearly all on the advance, and none made "under the rule."

SPELTER—Has been very dull and hardly any nominal prices even made.

PIG IRON—Reports begin to show variation. Some talk prices steady, while others say that buyers are hesitating, owing to an increase in the offerings. Furnaces are so well sold up, however, that they are not likely to change their ideas until stocks begin to accumulate, of which there are no signs at present.

STEEL RAILS—Sellers in this market are not disposed to meet the low prices talked about at other points. They find prices so near to cost, and cost so steadily hardening, that they are in no mood to quote less than \$23 until they can see a little further ahead.

Prices generally ruling for metals not regularly dealt in on Call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, @—; Billiton Tin, @—; Banca Tin, @—; Baltimore Copper, \$— @—; Orford Copper, \$16.00 @ 16.25; P. S. C. Copper, @—; Foreign Lead, \$4.75 @ 5.00; Foreign Spelter, \$5.40 @ 5.50; Antimony, \$10.00 @ 13.50.

Assessment Notices.

William Penn Mill and Mining Company.
Location of principal place of business, San Francisco, California. Location of works, Devil's Gate Mining District, Lyon county, Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 5th day of November, 1888, an Assessment (No. 3) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 59, Nevada Block, No. 309 Montgomery street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 13th day of December, 1888, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 31st day of December, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. J. SCOVILLE, Secretary.
Office—Room 59, No. 309 Montgomery street, San Francisco, California.

Lord of Lorn Gold and Silver Mining Company. Location of principal place of business, San Francisco, California. Location of works, Gold Hill Mining District, Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 13th day of November, 1888, an Assessment (No. 4) of Ten (10) Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 313 California street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 23rd day of December, 1888, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the 23rd day of January, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

L. G. HARVEY, Secretary.
Office—313 California St., San Francisco, Cal.

The EXPLORERS' and ASSAYERS' COMPANION.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, \$3.00 post-paid. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulae as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

HORACE D. RANLETT,

Ores, Mining, and Commission,

420 Montgomery St., S. F.

BUSINESS MANAGER OF

UNION COPPER MINE, Calaveras Co.,

"WHEELER PROCESS"

Working Refractory Gold and Silver Ores.

We are now prepared to receive Ore at our Testing
 and Mining Mill, Meriden, Conn., in sample lots of 500
 pounds, to be worked by the Wheeler Process, where we
 have succeeded in saving 90 per cent of the metal con-
 tained in the ore.

We work sample lots free of charge and report results
THE NEW CHEMICAL GOLD MINING
CO., Box 939, Meriden, Conn.

H.H.H. HORSE LINIMENT.
 THE H. H. H. Horse Liniment puts
 new life into the Antiquated Horse.
 For the last 14 years the H. H. H. Horse
 Liniment has been the leading remedy
 among Farmers and Stockmen for the
 cure of Sprains, Bruises, Stiff Joints,
 Spavins, Windgalls, Sore Shins, etc.,
 and for Family Use is without an equal
 for Rheumatism, Neuralgia, Aches, Pains,
 Bruises, Cuts and Sprains of all characters.
 The H. H. H. Liniment has many imi-
 tations, and we caution the Public to see
 that the Trade Mark "H. H. H." is on
 every Bottle before purchasing. For sale
 everywhere for 50 cents and \$1.00 per
 Bottle.

For Sale by all Druggists.

HEALD'S

BUSINESS COLLEGE,
 24 POST ST., S. F.

FOR SEVENTY-FIVE DOLLARS THIS
 College instructs in Shorthand, Type Writing, Book-
 keeping, Telegraphy, Penmanship, Drawing, all the En-
 glish branches, and everything pertaining to business,
 for six full months. We have sixteen teachers, and give
 individual instruction to all our pupils. Our school has
 its graduates in every part of the State.

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought
 Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MA-
 CHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE,

SUPERIOR TO IRON FOR

LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape
 Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths
STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled
 Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat
 Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames,
 and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES, THE GREATEST ROCK CRUSHER ON EARTH!

Will do twice the work with the same cost and wear of any other crusher made.

It will also add from 40 to 50 per cent to the capacity of any mill by fine work. The adoption of this Crusher will return 10 per cent per month on its cost over and above that of any other in use.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL,

The most perfect Roller Mill made, for the following reasons:

1. It is cheaper.
2. It is more durable.
3. It crushes a larger amount of ore with less power.
4. It amalgamates a larger percentage of the gold.
5. Its "clean-up" is quicker and fuller.
6. It is portable, requires no frame-work, and is ready for the foundation as it leaves the shop.

Full Descriptive Circulars of any of the above sent on application.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

Risdon Iron Works, San Francisco.—ORNTLMRN: Our Company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60-mesh screen. Our mills run 65 revolutions per minute, and each crush through 60-mesh screen 12 tons in twenty-four hours; through 50-mesh, 15 tons; and through 40-mesh, 18 tons. This proportion has been continuous. One set of Dies will crush from 1500 to 1600 tons. One set

of Tyres will crush 1500 tons. One ring plate will crush from 2200 to 2300. The mills require very little attention. At our mill an ordinary "peon" earning one dollar per day has complete charge. In regard to sliming, in comparison with stamps by reason of the discharge surface and the continuous agitation by the scrapers, a much less amount of slimes is created. A three years' experience teaches me that, in every respect, the mills are a complete success and of material benefit to the mining world. They can be set up and running in 48 hours, and can be dismantled in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator, it is unequalled by any mill now in existence.
Yours truly,
D. M. BURNS, Superintendent.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.

Iron Stills for Acid.

In the PRESS of Nov. 10th were reproduced cuts from Mr. Adams' paper on "Concentration of Sulphuric Acid," showing improved iron stills. Fig. 1 of the accompanying engravings shows still another modification—one of the latest and most successful types now at work. The simplicity and inexpensive construction of this apparatus commend it on sight; and, with gas-firing, the plant is a long way in advance of any made known as yet. By this entirely new method of working the flow of acids from pans to stills is continuous; the evaporation from the surface of the still proceeds rapidly and quietly; the sediments, from whatever source, are swept along and out of the still in the constant flow of a small current of strong acid; and, taking temperature and density into account, are precipitated in regular order in the larger space of the outside boot, where they remain until removed by the basin-shaped ladle.

It is Mr. Adams' opinion that cast iron has "come to stay," with a value for chemical purposes as yet little understood, but which the world must naturally profit by—a value due almost wholly to investigation, experiments and successes of Americans; a value sure to be hereafter acknowledged in the making up of cost-sheets on sulphuric acid. This practical use of the metal marks a change as worthy of recognition as the Gay-Lussac column, or the Glover tower, in their respective spheres—each of them most radical changes in the manufacture of this essential product.

By this use of iron, and this method of handling the contaminated acids produced from ores so abundant in our country, all the difficulties

heretofore met in the final preparation of strong sulphuric acids are overcome at a bound. Local circumstances will naturally call for modifications in the use of cast-iron stills.

after all, only a simple problem of distillation, which has heretofore been attended with difficulties solely on account of the tendency of the metals or minerals held in solution to cake or

Under a High Head.

The water-power and electric plant on the Sutro tunnel level of the Chollar incline for transmitting electric-power to operate the Nevada mill, is nearly ready for work. They tried the Pelton wheels and dynamos the other day. The phosphor-bronze wheels are 40 inches in diameter, and are driven under a pressure of 1630 feet. Water-wheels running under a vertical column of 1630 feet in height have never before been seen. Still these ran as smoothly as the other wheels in use on the Comstock under a pressure of only 500 to 600 feet.

The wheels are to run the dynamos for transmitting electric-power to the mill. The conditions are different from any ever tried before, though the work is by no means of an experimental character. It is known exactly what the Pelton wheels will do, and if the electrical appliances do their part of the work, as may be expected, there will be no trouble. The test must be satisfactory to the Nevada Mill Co. before the plant is accepted, but the system has been so thoroughly tested in other localities that there is little fear of its not operating. The Nevada mill will crush ore from the Hale and Norcross, Chollar and Potosi mines.

At a meeting in Pittsburg of the river coal operators, November 19th, it was unanimously decided to shut down all the mines along the Monongahela river for an indefinite period. This will

throw out of employment 1000 miners, besides all the river men engaged in the transportation of coal. The operators say the shut-down will be for two months at least. They claim they cannot sell to advantage now, as the market is overstocked and coal is low.

Fig. 1.—IMPROVED MODERN IRON STILL.

Fig. 2.—IMPROVED STILL FOR STRONG AND PURE ACID.

Fig. 3.—SECTION OF IRON PAN AND STILL.

The manufacture of virtually a new article in the trade (an acid of regular strength, and pure) will become general throughout the world in course of a few years; and we may expect to have presented many devices, of a more or less complicated nature, to accomplish what is,

cement on the bottom of the stills. It will be seen that nothing can be simpler or more effective for this service than the pot shown on page 329 of last week's PRESS, modified to the present perfected stills as shown in Figs. 2 and 3 on this page.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Washington Territory Mines.

EDITORS PRESS:—As the mining season is about at a close, a brief summary of events may prove of general interest. At Chemellah, 52 miles north of here, the Eagle mine put in steam hoisting works. They have a four-foot vein of ore that yields per cubic yard one ton of galena ore, 60 per cent lead and 70 ounces silver. A depth of 170 feet is attained, with 300 tons of ore on dump. The Enterprise has a few stringers of copper ore rich in copper and silver. At Brown's Lake, four miles west, assessment work done on the Fisher shows 20 inches of 60 per cent copper ore at a depth of 50 feet. No other mines in this camp have been worked worthy of mention. A new strike of high-grade ore nine miles north promises well. Fifty tons of 200-ounce silver ore are already on the dump.

At Colville,

The smelter run by Moore & Vivian succumbed to the inevitable and quit the business after a year's trial. The only money made out of the concern was by the organizer of the concern, who got a salary of \$800 per month out of the stockholders. The Old Dominion, which has produced in the last three years about \$200,000, has been worked by the Kearneys, who have been trying hard to liquidate a \$30,000 mortgage held by the Traders' National Bank of Spokane, but now have to turn the mine over to the bank and step down and out. The bank assumes the management, and will undoubtedly make it pay.

The Daisy, on the Columbia river, shows ten feet of self-fluxing lead carbonates. At the 200-foot on the crocset they have ore of an average value of 35 ounces silver and 30 per cent lead. The Bonanza has 40 inches of galena at a depth of 80 feet, with 50 per cent lead and 12 ounces silver. The owners can't agree, and work has been suspended. The Dead Medicine, up Clugstone, shows 20 inches of 80-ounce ore, 40 per cent lead. The Young America had the bottom dug out, and is a thing of the past. The Gray & Palmerston mine, above the Dalles, is in about the same condition. Up Kettle river no discoveries have been made worthy of notice. At Rock Creek a little development work ruined prospective fortunes and matters are *in statu quo*.

At Wannecott Lake

Are several flattering prospects; among them, the Triune and Jessie have fair chances of becoming paying properties. Considerable scratching has been done all over this district, with indications rather against it.

South 40 miles on Salmon river, or rather creek, the outlook is tough. A concentrator having a capacity of 50 tons per day was erected on the Homestake and Tough Nut properties. When the concentrator was ready to run, five or six tons of ore were on the dump. About 100 tons of barren rock, or most of it, was run through to make a showing, but the Tacoma inventors, after building two steamboats to carry one ton of ore out of the country at an expense of \$40,000, have let the property be attached by the help. Considerable work has been done in the camp, and while the ledge go deep and are regular, they only carry pay in small patches here and there.

The Mines Near Ruby City

Have had a good deal of work done on them. The Arlington mine on the surface averaged 15 ounces silver. Thirty thousand dollars was paid for it by Portland capitalists, and Prof. Clayton reported some hundreds of thousands in eight. A tunnel goes from the Oregon Pacific road was put in charge of the property, who ran a tunnel 450 feet deep, to gain a depth of 100 feet, at an expense of \$15,000, while a shaft representing the same development could have been sunk for \$1200. At 200 feet their ore body 4½ feet wide averages \$15 per ton silver and is worthless. The First Thought, on the same hill, shows a good streak of pay ore and may survive the working test. The War Eagle and Idaho are losing propositions. The Fourth of July has had no development work worthy of notice.

Bad Judgment.

The building of a concentrator and two steamboats by Tacoma people with no development work and no ore in sight (and what little there was being too low grade to pay mining expenses) is without a parallel since Ike Bateman organized his steamboat company to navigate Reece river, Nevada. The Riley gold-mill put up at Colville to run on barren rock was bought by Jos. F. Wardner, and moved to Elk Creek, near Wardner, and is now hammering out \$32,000 per month in clean bullion.

In the Cœur d'Alene all is bustle and excitement. New concentrators, hoisting works, gold-mills and large ore bodies are the order of the day, with more ore piled up at the stations than the railroad can handle. Two railroads are building in there side by side.

Kootenai River or Lake District

Is coming to the front with three or four prospective good properties. Twenty-one tons of ore shipped to Butte netted the Halls \$7200. The ledge are large, but pay streaks 20 to 30 inches.

South of Pend d'Oreille lake, on the headwaters of Cœur d'Alene river, or the North fork,

some fine bodies of 70 to 80 ounces silver and lead ores have been discovered and a promising district has just been organized. Down on Pend d'Oreille river at the falls several lead mines carrying but a trace of silver have been sold to the Great Falls (Montana) smelting folks, and steamers are to be put on by Portlanders in the spring to transport the ore to Sand Point, on the Northern Pacific road.

South of here they have made some lead discoveries near Moscow that look anything but flattering.

Upon the whole, Cœur d'Alene and Kootenai have had a prosperous year, while Salmon River and Colville do not come up to expectations. Colville, however, has a future when the property gets into the hands of the proper parties. The Seattle, Lake Shore & Eastern railroad now runs ten miles west, and will have 60 miles of road running west toward the Great Bend this month. The Oregon Railway & Navigation Co. are pushing their road from Rockford, 25 miles distant, to this point with all possible haste.

Spokane Falls, W. T.

OBSERVER.

Electric Lighting by Incandescence.

[Written for the PRESS by GEORGE B. FRALEY.]

The light of an incandescence lamp has been shown to be suitable in every respect for domestic use. Its characteristics are the characteristics of daylight. In steadiness it is comparable only to the light of the sun. No other artificial light, not excepting that of the best Argand burner, is as steady. The cause of this is that the combustion of the carbon is prevented, and when the carbon is raised to the temperature of limpid incandescence there is no difference between the light evolved and that which, proceeding from the sun, is diffused and softened by the stratum of air it traverses. The heat radiance is much less than that of gaslight of equal power; the noxious vapors proceeding from the combustion of illuminating gas disappear; no chemical action takes place, but, hermetically sealed in its crystal chamber, protected from danger of fire and explosion, a fragment of carbon glittere and glows, rises to the light of a taper, brightens and broadens and finally illuminates with the effulgence of day. This is what the incandescence light should be and what it is under proper conditions.

Cost Compared with Gas.

There being no question as to the adaptability of this new illuminant to all the purposes of interior illumination, the other and most important question that arises is one of economy. Is this light, which is better than gaslight, as cheap as or cheaper than gaslight? In the best steam engines the consumption of coal per hour per horse-power is two pounds, costing at \$5 per ton one-half cent. One pound of coal yields five cubic feet of gas, and therefore the cost of one cubic foot of gas is one-twentieth of one cent. To produce the light of 600 candles by the incandescence machine involves the consumption of one pound of coal, costing one-quarter cent. To produce equivalent light from gas at a rate of consumption of five cubic feet per 15 candle light, we must burn 150 cubic feet, and the cost of production at one-twentieth of a cent per cubic foot or 50 cents a thousand is 7½ cents. Thus the cost of electric is as to fuel consumption but one-thirtieth the cost of gaslight; but there is an advantage in the respect of coke recovered in the retort in case of gas, which may be said to increase the cost of electricity.

One cubic foot of coal gas equals 690 heat units or 532,680 foot-pounds, and five cubic feet equals 2,663,400 foot-pounds. The five cubic feet of gas burned in the boiler of a steam engine recovering ten per cent of the energy conserved in the gas, will yield in mechanical force $\frac{266,340}{1,580,000}$ horse-power, which would develop in the electric lamp a light of 130 candles. Burned in a gas-burner, it develops but 15 candle-light, therefore it is cheaper to convert coal into gas and gas into steam-power, and the steam-power into electricity, and the electricity into light, than it is to produce light by the direct consumption of gas.

The cost of lighting has almost invariably been unfairly stated by the gas interest. On the other hand, by the electric-light interest, the statements of the former have been based upon the working of small steam engines, and the cost of running them is always excessive, and the cost of attention always excessive, because confined to a limited development of power. With large steam engines, however, that is, engines of 100-horse power, it is less than one cent per hour. Instead of taking the cost of gas as the basis of calculation, the electric-light interest has considered the cost as it would the retail price of any production. Furthermore, the gas interest has invariably urged the cost of the conducting wires as an insurmountable obstacle to the general use of the electric, and bases its conclusions upon the size of the wires employed in uses of the voltaic arc lamps, where the utmost utilization of the current has been attempted.

In no case will the cost of electric maine equal the cost of gas mains; in most cases it will fall below 50 per cent of the cost of gas mains. In no case will the cost of branch electric conductor equal the cost of branch gas conductor.

Advances in Electric Lighting.

In turning from the contemplation of this subject, it is useful to consider that the ad-

vances made in electric lighting within a very few years are of a nature calculated to raise our anticipations to a point beyond the warrant of actual facts. When we recall to mind that from the discovery by Oersted in 1820 that an electric current would deflect a magnetic needle, and from the later discovery by Faraday of the phenomena of magnetic induction we have realized the electric telegraph and the electric light of to-day, we may consistently congratulate ourselves on the age in which we live. But we should not be sanguine that because of all this the millennium is close at hand. The application of electricity to public and private illumination is a realization of the near future no longer to be questioned. It is not probable, however, that electricity will ever entirely supersede gas. Indeed, it does not appear that illuminating gas has materially affected the consumption of illuminating oils. There is room and will doubtless continue to be for all methods of artificial lighting. It is not likely for many years to come that we shall witness anything other than the extensive use of electricity, nor shall public buildings and private residences, streets and squares be better illuminated than at present, the new form of light keeping pace, however, with the progress of older and well-tried institutions.

Fleas.

EDITORS PRESS:—We seem to be having a plague of fleas this year in San Francisco. A single (or married) flea is capable of ruining my night's rest, not so much by its biting as by its hilarity thereafter. I have tried buhach, or insect powder. It did some service, but was not prohibitory in its effects. But all things come to those who know how to wait—if they live long enough—and I have solved the problem of sleeping in peace, so far as fleas are concerned. Every night, before retiring, I scrape with a knife a small quantity of camphor—less than a gramme—and sprinkle the lower sheet with it. I undress at some distance from my bed, then turn my nightdress inside out and shake it before putting it on; thus I take no fleas to bed with me, and I have no further trouble. Not only do I escape molestation at night, but it seems that my skin becomes so impregnated with the camphor that I am no longer annoyed, as formerly, by the little wretches getting into my socks and underclothing in the daytime as they formerly did.

Let the fiat go forth—the fleas must go!

JOB PRESS.

The Folsom Dam.

Water Turned Into the Main Channel.

There were great times at Folsom prison on the 15th inst. The temporary dam which had been built to divert the waters of the American river during the partial construction of the solid dam of granite, was blown up in the presence of a large assemblage, and the waters came rushing down upon and through the culverts in the formidable wall of stone masonry.

A mighty cheer went up from the scores of convicts who had been employed in the work of construction, and Horatio P. Livermore, manager of the Folsom Water-Power Company, Engineer Humbert and Warden Aull were overwhelmed with congratulations. The cornerstone for the new dam was laid Sept. 18th, and since that time, with convict labor, 90,000 cubic feet of solid masonry has been put down. The foundation of the structure is 26 feet below the bed of the river, and is placed upon solid rock. It is 60 feet at the base and 52 feet at the top. When completed it will be over 40 feet in height, giving a fall which will afford illimitable power.

Warden Aull told a *Chronicle* correspondent that if he had a sufficient number of men he would guarantee that both the dam and the canal would be completed within one year. It is believed that when this is done there will be ample power to run all the manufacturing establishments which may be placed on the canal, and that, with the assistance of electricity, power will be furnished to run every wheel in Sacramento, leaving the water to irrigate thousands of acres of land.

LOST DIGGINGS.—The utter failure of the last and best expedition to discover the lost Adame's diggings, the tales of the richness of which are legion, has served the good end of forever dispoising of the "hoodoo" that has led so many adventurous prospectors to the laughter. It is now generally conceded that Adams was crazy, or a great dreamer, for it is utterly absurd to believe that a glittering box canyon of gold quartz nine miles in length, having a stream of living water equal in volume to the Socorro hot spring, can yet be hid away by the Indian and remain unrevealed to the white man. The Socorro mountain and its hurried church treasure may now come to the front.—*Pueblo Chieftain*.

THE sum of \$241,601 was spent at Mare Island during the past year, and this year \$503,127 is asked for. Of this, \$40,000 is wanted for a rolling-mill, \$80,000 for the granite drydock and \$211,000 for extension of the quay-wall. They intend putting up three 12-ton swing-crane along the water-front.

California Woods in Autumn.

Edward L. Greene, assistant professor of botany in the University of California, contributes the following charming sketch to the *Garden and Forest* of New York City:

Although California lies wholly within latitudes which, in other lands, give marked changes of the seasons, yet here neither spring nor autumn is very definitely characterized; autumn less so than spring, if that may be called a vernal season, which begins in November or December, comes to a halt in January, thence gradually advancing to its perfection in April, a half year after it begins.

Between July and November the face of nature undergoes but little change, and only the eye of the artist or naturalist will perceive the transition to autumn. The dahlias, the China asters and the late chrysanthemums are in the gardens, blooming at the right season, too, and these give a little of the autumnal aspect to village and home, especially where late autumn fruits are ripening on the trees, and Eastern elms and maples, planted along the streets, are shedding the yellow or brown leaf. But out among the hills it is scarcely so. The native trees, even to the oaks, are chiefly evergreen; and even such oaks as are really deciduous, retain their foliage in full color until the dark rainy days of December, baring their gray trunks and branches not until the ground beneath and around them is bright green with fresh growing grass like that of spring.

There are, nevertheless, some autumnal wild flowers in California; and even a few trees whose altered foliage imparts, in September, an autumnal aspect to the tree-clad slopes of all mountainous and hilly districts. Wherever, in the near or distant landscape, a patch of deep yellow comes out in contrast with the dark but vivid green of oaks and hays, one knows it must be a clump of the native maple (*Acer macrophyllum*), a tree distinguished from all others of its genus by the uncommon size of its leaves, which, in California, are half a foot broad on thrifty trees, in Oregon even larger. It nowhere makes up a forest, or even a small grove, by itself; only two or three in a place, or, at most, an interrupted succession of them, ranging up and down the course of a ravine or brook, are what one sees of this species in its native wilds. The foliage ripens and turns to yellow long in advance of the earliest frosts, so that before the equinox it is in its richest and decidedly autumnal garb.

In the higher Sierra only, and chiefly toward the northern boundaries of the State, occurs a smaller maple (*Acer glabrum*), the leaves of which acquire an almost crimson hue as the autumn days advance; but this species is never met with in the more settled, western regions of California, with which we are concerned. The only red leaves here are those of the wild grape (*Vitis Californica*) and of the everywhere too prevalent poison oak (*Rhus diversiloba*). This last is altogether distinct from its East American analogue, having foliage of firmer texture and more rounded outline. In its autumnal dress it is truly beautiful, but this is taken on, at least in some parts of the country, as early as August, before we begin to think of the fall of the year. The same is true of another small deciduous tree, the native horse chestnut (*Asculus Californica*), whose fading leaves of yellow and red-brown are efficiently autumn-like, in whatever more elevated districts they do not fall before the end of summer.

With aetere and golden rods, Pacific North America is not well furnished. In the western parts of California we have but two or three species of each; and the most common of the golden rods (*Solidago Californica*) is almost gone before the autumnal days begin. One of the aetere (*A. radulatus*), a white-flowered, low species, with a simple flat-topped corymb crowning the leafy stalk, is met with along the borders of roads and thickets, but scarcely elsewhere. This also comes near being a summer flower; but it is in pretty condition in the early part of September. The blue-flowered species (*A. Chilensis*) is taller and more showy, quite like some of the Eastern asters, and it flowers quite late, growing chiefly in low, half marshy grounds, not far back from the sea.

The characteristic autumnal wild flowers of California are the various species of Madia and Hemizonia, known in every-day life by the not very promising appellation of tarweeds. With an abundant resinous hairiness, such as most of the kinds are invested with, they are not pleasant plants to handle or to walk among; but they grow in masses, on open hillsides, by streamlets in the woods, in stubble-fields by acres, their white or yellow flowers giving color to miles of territory but only in the early part of the day; for their broad and handsome rays, at least those of most species, wither like the corollas of morning-glory, or four-o'clocks, as soon as the sun is in mid-sky. The tallest species (*Madia elegans*) is a strikingly showy, Coreopsis-like plant, altogether neat and graceful, however offensive its tar-like stickiness is to the touch. The rays, one inch long and deeply three-lobed, are of a lively yellow, with a velvety red base. The heads are borne loosely and somewhat pendently at the ends of slender, almost leafless branchlets, the main stem standing six feet high or more. No lover of things beautiful can fail to admire the uncommon grace and coloring of this Madia, as it lightens up the roadsides and banks of streamlets through miles of mountain forest.

Afar from the fields and waysides, in deep mountain shades, where, after the drouth of

more than half a year, the streamlets are still flowing, one may find in October fine masses of flowers and ferns; not strictly autumnal plants, yet such as, at least, have the faculty of putting forth just now a second and a truly autumnal display of color. Such are two or three species of *Mimulus*. We shall find no scarlet to match that of the *Lobelia* of Eastern brook-ides, but the *Mimulus cardinalis* is scarcely inferior to that; and the hanks of *Mimulus odoratus*, often two feet high, and seeming like an overgrowth, large-flowered and scentless musk mimulus, are a charming sight.

Another plant, one of the Saxifrage tribe (*Boykinia occidentalis*), with most elegant foliage and loose panicles of white or pinkish flowers, lingers in bloom from June until October. Here, too, the brilliant pendants of *Eucyninus* and the large red globes of coral berries (*Cornus Nuttallii*), and the falling acorns of the California evergreen chestnut oak, all shed their sweet influences, and make us feel that, even in California, there are autumnal days.

Rewards for Gold Discoveries.

The colonies of Australia have a system of rewarding the discoverers of new gold fields, which has worked well. Prospectors are evidently appreciated and encouraged there, and not by any means looked upon as tramps or idlers. Their vocation is one publicly acknowledged to be beneficial to the community. Encouragement is given them to explore remote regions, since, in addition to the value of any "finds," the Government pays them a stipulated sum.

It will be interesting for us to note the conditions under which rewards will be given for the discovery of new gold-fields in Victoria. It will be seen that, aside from the value of yield, the question of number of men given employment is taken into consideration. The conditions are as follows:

That person will be deemed the discoverer who shall first find gold, mark out a claim and notify the same in writing to the warden or police magistrate of the district. In such notification the discoverer shall state, as nearly as practicable, the exact locality and distance from the nearest gold working or nearest town.

No reward will exceed £1000. In fixing the amount to be paid for any discovery, regard will be had to the number of men employed on the new gold-field, its distance from the nearest gold workings, the character of the deposits in which the gold occurs and the depth of sink.

If two or more persons simultaneously discover gold in the same locality, or in places immediately adjacent, and they each severally comply with the conditions mentioned, the sum proper to be awarded will be divided among the several persons who have discovered the gold-field in such manner as shall be just.

Rewards shall be given in accordance with the following scale, namely:

A. For the discovery of a gold-field, distant more than one mile, and not exceeding two miles from the nearest gold workings, and on which there shall be employed, three months after the report of the discovery having been made, not less than 200 men, a sum not exceeding £200.

B. For the discovery of a gold-field, distant more than two miles, and not exceeding three miles from the nearest gold workings, and on which there shall be employed, three months after the report of the discovery having been made, not less than 200 men, a sum not exceeding £300.

C. For the discovery of a gold-field, distant more than three miles, and not exceeding five miles from the nearest gold workings, and on which there shall be employed, three months after the report of the discovery having been made, not less than 200 men, a sum not exceeding £400.

D. For the discovery of a gold-field, distant more than five miles from the nearest gold workings, and on which there shall be employed, three months after the report of the discovery having been made, not less than 200 men, a sum not exceeding £500.

E. For the discovery of a gold field, distant more than five miles from the nearest gold workings, and on which there shall be employed, six months after the report of the discovery, not less than 500 men, a sum not exceeding £1000.

ALASKA'S RESOURCES.—Prof. Davidson of the United States Coast Survey has in Bulletin No. 4 of the United States Coast and Geodetic Survey dwelt upon the resources of Alaska and their development. He considers that the exigencies of the increasing trade demand that a thorough and exhaustive survey of the Alaskan coast should be at once proceeded with in order to enable mariners with data for their guidance. Tables exhibiting the statistics of the salmon, whale, codfish and fur trade are appended.

DREDGER PATENTS.—A. B. Bowers has commenced suit in the United States Circuit Court against Alexey W. von Schmidt, for an alleged infringement of dredger patents. It is averred on behalf of the complainant that on May 26, 1885, he was awarded a number of patents for improvements in the mechanism of dredgers. Since that time the defendant has, it is alleged, wrongfully made and used the new devices. An accounting, damages and an injunction are sought.

A Pretty Medicinal Plant.

We present herewith a medicinal plant of attractive appearance though of decidedly unattractive effect upon the system to which it is administered. The plant is known as "Indian physic" (*Gillenla trifoliata*) and is one of the series of native medicinal plants as drawn and described by Dr. Geo. Vasey, botanist of the Department of Agriculture. It is a perennial herbaceous plant, of the natural order *Rosaceae*, growing throughout most of the States east of the Mississippi river in shady, moist locations. It is most abundant east of the Allegheny mountains. The root consists of "many long, slender, brown branches, proceeding from a thick, tuber-like head." Usually several stems rise from the same root;

INDIAN PHYSIC—*Gillenla trifoliata*.

they are erect, slender, smooth, from two to three feet high, branched above, and very leafy. The leaves are in threes (trifoliate), each part or leaflet having a short stem or petiole, is mostly oblong or lance oblong in outline, or sometimes obovate, from two to three inches long, sharp pointed, and the margins have many sharp, close teeth. Most of the leaves are set close to the stem (sessile), and have at the base of each a pair of small linear-lanceolate stipules, like diminutive leaves, decreasing in size from below upward. The flowers grow from the upper branches on slender peduncles one to two inches long, and form a loose, open, corymbose panicle. The calyx is tubular bell-shaped, a quarter to a third of an inch long, with five small, erect teeth. The five petals are inserted on the inside of the calyx near the top. They are linear-lanceolate, three-fourths to two-thirds of an inch long, spreading, and of a white or pale rose color. The stamens vary from 10 to 20 in number, are small and inclosed in the calyx. There are five styles and ovaries, which are finally succeeded by five small pods, cohering at their base, separate above, each valve containing about two seeds.

The dried root is the part used medicinally, and is of an emetic and purgative nature. It

has been used as a substitute for ipecac. It was employed by the Indians, and from them the people of the colonies learned its properties. There is another species, the *Gillenla stipulacea*, which has essentially the same properties. It is gathered for commercial purposes to some extent in North Carolina.

Working a Gravel Mine.

We visited the rich gravel mine of Mr. J. R. Moffitt on the Tuolumne river last week and had the pleasure of seeing the gigantic scheme in full blast. Mr. Moffitt with characteristic genius and energy has tamed the river and now conducts the entire stream along the north bank in a flume 12 feet wide and 4 feet high. This water flows under and drives three large under-

virgin ground, and he therefore believes that there are millions in the uncovered earth. This is the richest gravel mine of which we have personal knowledge in the world, and it snuffly overthrows that theory which so often obtains, and which contends that the placers and river claims have seen their best days. There are fortunes yet in the placers and riverbeds of Tuolumne.—*Union Democrat*.

Comstock Bullion Yield.

Following is a statement of the ore and bullion product of the Comstock lode mines for the quarter ending Sept. 30, 1888, obtained from the official reports of the superintendents now on file in the assessor's office:

Consolidated California and Virginia.
Produced 30,126 tons of ore, yielding a total of \$682,218.26 in bullion; average yield per ton, \$22.75; actual cost of extraction, transportation and reduction, \$464,335; net yield above cost of production and subject to bullion tax, \$117,883; total bullion tax on the net proceeds, \$3436.49.

Confidence.
Produced 9207 tons of ore, yielding bullion valued at \$176,064.93; average yield per ton, \$19.25; actual cost of extraction, reduction and transportation, \$156,975; net yield above cost of production and subject to bullion tax, \$19,089; bullion tax, \$572.62.

Hale and Norcross.
Produced 6365 tons of ore, yielding bullion valued at \$171,941.80; average yield per ton, \$27; cost of extraction, transportation and reduction, \$141,065.72; net yield above cost of production and subject to bullion tax, \$30,876; bullion tax, \$926.

Yellow Jacket.
Produced 1370 tons of ore, yielding bullion valued at \$5765.36; average yield per ton, \$7.25; total cost of extraction, reduction and transportation, \$41,605; cost of production above yield, \$31,930. No tax.

Challenge.
Produced 1248 tons of ore, yielding bullion valued at \$24,170.81; average yield per ton, \$19.75; total cost of extraction, reduction and transportation, \$51,435.54; cost of production above yield, \$27,265. No tax.

Recapitulation.
The total number of tons of ore extracted during the above quarter, according to the above statement, was 28,316, producing bullion valued at \$1,064,158. The total products of the Savage and Chollar are not included in the above list, which will swell the total to \$1,175,900. The product of the last quarter of the current year is about \$940,000 below that of the preceding quarter, due to a lack of ore-crushing facilities.

Coast Survey News.

Important Work in Southern California—The Alaskan Boundary.

Prof. Davidson and Captain Lawson of the Coast and Geodetic Survey have gone to Los Angeles county, near Anahim, to make surveys for the location of a base line. This work will not be completed for several months. An appropriation of \$100,000 having been made by Congress for the purpose of running the boundary line between Alaska and British Columbia, J. H. Turner of the Coast Survey has been ordered here from the East to join the party that will be sent out next spring. Captain E. F. Dickens and party of the Coast Survey have just returned from the southern coast of Oregon, where they have been engaged since last May in prosecuting the work of the Coast Survey. During the season they made a topographical reconnaissance of the coast from Port Orford to Cape Sebastian, including the Rogue River reef, locating the position of several dangerous sunken rocks. They also made a topographical survey of the coast between Umpqua river and Coos bay. This party now expect to remain in the office here all winter, making up their report of this past season's work.

VALUE OF ENTERPRISE.—When times are good and employment not scarce, no one thinks of giving credit to those who have, by their energy and courage, hoisted up the enterprises which form the basis of prosperity. But when times are dull and no labor is to be had, then there is an expressed appreciation of such men. The man who risks his money in developing mining property, which in turn gives labor and supports communities, is never thought of till he quits operations. An appreciation of such efforts on the part of those who are benefited by it, stimulates to further effort. Nevada district needs men of hope, of pluck and capital, right now. Without them it will not prosper. Let what few we have be duly appreciated, so that others may be induced to take hold. We have the gold in the ground. When it is diligently sought, it will be brought to the surface in paying quantities. Every prospect started in the county means the expenditure of money by the operator, with the chances of losing it all. Every such prospecting enterprise gives labor and helps trade. All gain by it except the unlucky wight whose hopes induced him to risk his coin with the hope of developing the country and of gaining money for himself. All the encouragement possible should be extended such operators. Their work benefits every one and their enemies is equally beneficial to all.—*Nevada City Herald*.

Passing Events.

The earthquake shook experienced around the San Francisco bay region on Sunday was the heaviest since 1871. There were six on the same day, the first being the heaviest.

Several parties are making preparations for observing the total solar eclipse which occurs on New Year's Day. All of these parties will use both telescopes and cameras, and it is hoped to obtain some good observations of the corona.

The miners who own gravel claims are anxious to learn the proposed manner of procedure of the recently appointed debris commission. It has not as yet met, all of the members not having come to the city. As soon as any plans are adopted we shall inform our readers what they are.

The rainy weather has continued most of the week and doubtless the ditches and streams are running full in all directions. The advent of the rain is welcomed in California by both miners and farmers.

Important work will soon be carried on in this bay, notably the extension of the seawall on the city front and the opening of the tidal canal at Oakland harbor. These works are of interest from an engineering point of view and will give employment to a number of contractors and workmen.

The Mining and Scientific Press.

Now that prospectors have gone into winter quarters and miners have long evenings to themselves, they have more opportunity for self-improvement than during the busy summer. There is more time for reading and finding out what other people are doing in other mining sections, what new regions are being developed, what new systems and processes are being tried, and what improvements are going on in mining, mechanics and metallurgy. There is no better way to find these things out than by reading the MINING AND SCIENTIFIC PRESS. It is the aim of the publishers and editors to collect everything of interest on these and kindred subjects and present them in suitable form to the readers of the PRESS.

Of late, several features have been improved in this paper. We have enlarged the scope of our market reports materially, giving more space and embracing a short review concerning such articles. These reports are specially arranged for mining readers, and, for that purpose, are the best published on this coast. Our illustrations are much more numerous than formerly, and this feature we intend to still further improve. Our list of correspondents has increased, and each week there are interesting and instructive contributed articles from various sources.

Those who are familiar with the PRESS would greatly oblige us by calling the attention of others to its merits in order that by extending our list of subscribers we may be enabled to add new features and improve the paper as occasion demands.

Heavy Copper Production.

Although it is said that the recent contracts of the French syndicate with various copper mines will restrict production to some extent, up to this time the copper product has been increasing, especially at Lake Superior, where the largest mines of this metal in the United States are located. The output last month amounted to no less than 5867 tons mineral from ten mines, against 4901 tons in October, 1887. The total for the past ten months is 45,018 tons, against 39,615 tons the corresponding period last year. The output of the mines is given as follows by the Boston Transcript:

	October 1888.	October 1887.	Jan. 1 to Oct. 31, 1888.	Oct. 1 to Oct. 31, 1887.
Tons.	Tons.	Tons.	Tons.	Tons.
Calumet & Hecla, 3,914	3,657	26,298	25,845	
Tamarack.....	955	501	6,236	4,439
Quincy.....	341	619	3,827	2,550

Copper Falls.....	80	...	642	360

Total 10 mines...5,867 4,901 45,018 39,615

The most striking point in the October figures is the immense increase in the Calumet and Hecla's output, 516 tons more mineral having been produced in October than in September. The Calumet and Hecla's total output for the year to date is larger than the same period in 1887 for the first time this year.

The aggregate product of the 10 mines, representing all those at present actively producing, save the Allouez, was 5867 tons of mineral in October, against 5009 tons in September, and 4901 tons in October, 1887. There has been a steady gain in the amount of copper produced by the Lake Superior mines from month to month this year, under the stimulus of the contracts with La Societe des Mateaux. The total product of the seven mines producing in January was 3510 tons of mineral. In October the Lake output was 5867 tons, an increase of 67 per cent. The total October output of 5867 tons of mineral figures at fully 9,000,000 pounds of fine copper, representing a net profit to the mining companies over all expenses of producing, treating and marketing of fully \$700,000, while the total product for the first ten months of the current year of 45,018 tons of mineral figures at somewhat over sixty-seven and a half million pounds.

THANKSGIVING.—Before the PRESS comes to its readers again Thanksgiving Day will have passed by, and due observance will doubtless be made all over the country. Our mining friends particularly have reason to give thanks for a prosperous year, knowing as they do that the industry with which they are connected is doing well by them and improving in every way. In this State the abundant rains, so far, insure future prosperity and busy times.

Cost of Mining Silver Ores.

The Granite Mountain Mining Co. of Montana crushed during the last fiscal year 25,993 dry tons of ore, which yielded \$3,043,872, the mine being enabled to pay in dividends for the year \$2,200,000.

In view of these extensive operations the careful record of work kept is interesting and instructive. The two mills have been steadily at work, Mill B having commenced in February, 1887. A new 90-stamp mill will soon be added. The record of mill work is as follows:

Mill A, crushed in wet tons.....	8,703,104
Mill B, crushed in wet tons.....	16,912,494
Amount of salt used.....	25,615,598
	3,250,700
	28,976,298

Number of dry tons.....	25,993,050
Assay of ore, Mill A.....	145,939
Assays of tailings A.....	9,352
Per cent saved.....	94,418
Assay of ore, Mill B.....	122,827
Assay of tailings B.....	9,872
Per cent saved.....	92,925
Number of Dore bars.....	1,916
Number of ounces pure silver.....	3,168,507.04
Number of ounces pure gold.....	1,776,260
A mill in service.....	341 1/2 days
B mill in service.....	343 1/2 "
A mill crushed 3 stamp, 7 day of 24 hrs.....	1,012 tons
B mill crushed 3 stamp, 7 day of 24 hrs.....	1,102 "
A cost of milling, per ton.....	\$12.298
B cost of milling, per ton.....	11.335
Average cost both mills combined.....	11.684

The most interesting feature of the work to a millman, however, is the analysis of cost of treating one ton of ore in Mill B, where a careful record was kept. The analysis is as follows:

	LABOR.	Am't.
Superintendence.....		\$0.3529
Millwrights.....		1.053
Engineers.....		1.090
Firemen.....		1.268
Crushermen.....		1.173
Dryermen.....		1.043
Roastermen.....		1.374
Salt rolls.....		1.465
Batterymen.....		1.177
Battery helpers.....		1.371
Cooling floor.....		3.007
Panmen.....		1.676
Pan-helpers.....		4.939
Dustman.....		0.940
Retortman.....		0.743
Laboratory assistant.....		0.740
Storekeeper.....		0.984
Watchman.....		0.673
Mill-repairer.....		0.630
Sundry labor.....		2.225
Total.....		\$3.5890

	FUELS.	Am't.
Castings.....		\$0.7037
Wrought iron.....		0.054
Lubricants.....		0.044
Iron nails.....		0.042
Charcoal.....		0.005
Quicksilver.....		0.712
Shovels.....		0.009
Belt.....		0.009
Chemicals.....		1.328
Salt.....		2.875
Fuel.....		2.627
Team account.....		1.121
Blacksmith account.....		2.079
Sundry supplies.....		1.219
Total.....		\$7.7960
Labor.....		3.5400
Total.....		\$11.335

It will be seen by this that by far the largest items are cost of salt and fuel. Records of this kind are very useful for reference and comparison, but they are very seldom kept in such detail by those in charge of mills.

Discount on Silver.

To show how the discount on silver affects mining operations, the record of a single mining company for a single year may be taken. The Granite Mountain Co. of Montana received from the sales of their silver, during the past fiscal year, 94.48 cents per ounce. The difference between the average price for which they sold their product and the price at which the Government sells it to the people has been 34.8 cents per ounce, and on the 3,162,972 ounces produced and shipped by this one company, their compulsory contribution to native and foreign monometallists has been \$1,100,000 for the fiscal year. The president of the company calls attention to this very forcibly in his annual report. The free coinage of silver would give silver-producers 36 per cent more than they now receive, and which now goes to swell the Treasury surplus. The Treasury of the United States pays for silver at the market value of bullion, say at the rate of 95 cents for a pure ounce, at which rate 37 1/2 grains of pure silver in a standard dollar costs the Treasury about 73 1/2 cents, from which it will be seen that the Treasury makes, say 26 1/2 cents on every dollar coined, or a profit of over 36 per cent out of the people.

FREEMAN'S DRY-PROCESS SEPARATOR.—In answer to several inquiries we may say we have written to find the exact address of Mr. J. B. Freeman, and on receipt will publish it in the PRESS.

Something About Elevators.

[NUMBER 4.]

On the opposite page are engravings of an elevator safety brake and of the Ellithorpe Air-Brake Co.'s passenger elevator. The car of the passenger elevator is driven by the operation of a hydraulic engine, which, by its slow, noiseless and limited movement, raises it at any speed up to 250 feet per minute. The action is simply the inverse action of the common tackle-block, which multiplies the power by the number of sheaves to raise a larger load through less space. In this the power is divided by the number of sheaves to raise less load through a larger space. The number of sheaves will vary from 4 up to 12. The action of this water, which may be used from the street mains if the pressure be sufficient, is controlled by a hydraulic valve and operated by the car attendant. To raise the car, the water is let in to one end of the cylinder; this acts upon the piston, which is forced forward with its connection and cross-head carrying one set of dividing sheaves. Upon a fixed shaft at the other end of the cylinder is another set of sheaves.

The wire cables are attached to the cylinder rigidly, then pass under and over these two sets of wheels (as seen in the cut), then up to the top of the hatchway, over carrier wheels and down to the car.

When the engine is extended to its full length, the car is at the top, the valve is closed, and the car is sustained at the top by the water in the cylinder. The action of the valve having reversed, the car descends as fast or as slow as the water is discharged from the cylinder. The car is self-stopping at the bottom and top by its own movement, operating the shafting cable, but as a further preventive of accidents, additional stops are placed on cylinder, which allow the piston to travel only the distance necessary for the total travel of the car.

A water register is attached to the cross-head, which accurately measures the number of cubic feet or gallons, according to the travel of the piston.

Having thus briefly described the motive-power for raising and lowering the passenger car, we now refer our readers to the cut which illustrates the improved air-brake and air-enshion, and before giving some wonderful accounts of its positive action in danger, let us look into its mechanical construction.

No. 1 in the cut shows the cast-iron box through which the levers (2) pass; upon the top of the levers are the jaws (3) that grip the guide ways (4); the fulcrum-pins are shown by dots through the lever-box; this box is firmly bolted to the top or bottom of the cage, as may be most convenient.

The screw shaft, A, has upon one end a right-hand thread, upon the other side, a left-hand thread; the nuts B-C contact the levers upon either side; S is a spool upon said shaft, around which the cable G is coiled; 7 is a short cable connecting at the eye with cable C; cable 7 has upon its end a center pulling-hook, G, which slips under the end of the spring, F. Now follow the cable G over to the air-tube or box, C, where it attaches to the plunger, B; this air-tube extends from top to bottom of the elevator shaft; it may be contiguous to the shaft or remote from it, and should be from six to seven inches inside. The cord G passes over sheaves at the top. The operation when the elevator is running is this: Whenever the elevator goes up, the plunger B descends, and vice versa; the plunger B is made to fit the tube loosely, leaving a freedom upon each side of 1/2 of an inch; while the elevator is descending, the air in the top of the tube must pass by the plunger as it rises, producing a pressure upon the plunger of, say 1/2 pound to the square inch; but if from any cause the elevator should descend faster than is intended, a corresponding pressure of the air upon the plunger communicates the additional strain to the cord 7 and the hook G, and will instantly detach the hook from the spring F, instantly throwing the whole force upon the spool S, rotating the shaft A, thus spreading the levers S by means of the brass nuts B-C; engaging the jaws S-S with the guides 4-4; producing a friction of great force through the combined power of the screw and lever. The force will bring the cage to a stand within five or six feet without concussion.

Patent Air Cushion.

In addition to the air-brake, elevators of this manufacture are provided with an appliance

called the air cushion, which is placed under the cage or car at the bottom of the shaft. It is provided with suitable relief valves and is constructed in a novel manner and is claimed to be absolutely safe.

The cage can be raised to a height of 130 feet or more and loaded with tons of pig iron, eggs, glassware, plate-glass standing on edge or flatways, glasses filled with water, passengers, etc.; the safetys can be removed and the rope cut, allowing the cage to fall to the bottom, when, striking the cushion, the cage gradually stops, so that not an egg will be broken or a drop of water spilled or a passenger hurt or jarred. A cushion of this description will be placed under the passenger elevator now being constructed by this firm for the new Barker building on Sixth street, corner of Jessie. A public test of same will be made.

Very successful tests with this appliance have been made in other cities. In one instance an elevator with six occupants was allowed to drop 109 feet. In this case the weight of elevator and people was 2800 pounds, but the occupants all walked out safely after the rapid trip. At the New Orleans Exposition the elevator, cut loose from all cables, was allowed to drop 125 feet, but neither the occupants, nor building were in any way injured. These experiments have been tried a number of times under varying conditions of weight and height, and always with success.

Col. Ellithorpe has probably devoted more thought to secure absolute safety in the use of elevators than any other inventor in this line. No other inventor has taken the bold position that he could drop a car and its load, weighing four, five or six thousand pounds, from an elevation of from 50 to 150 feet, through the open air, with all the force that the law of gravity could carry it, and land it safely at the bottom, by simply resisting the weight and its terrible momentum, by interposing nothing but the common atmosphere. This he has successfully done in many prominent cities. This success has won for him confidence, and we shall look forward to the promised exhibition of the new elevator now being placed at the Union Club and the Barker building in San Francisco with considerable interest.

These elevators and safety appliances are built by Wm. H. Birch & Co., 119 Beale street, who have secured the patent rights for this coast. They also build all kinds of elevators, including hydraulic rams, sidewalk, worm-gear, steel screw, steam, pur-gear and hand-power elevators. S.

ALASKA MINES—The Governor of Alaska in his report says that the stamp-mills on Douglas island are the largest in the world, and have an estimated output of \$150,000 in gold per month. Other gold mines are being developed on the same island and the report notes the sale of four claims for \$1,500,000. Promising silver discoveries have also been made. The Governor thinks there is enough coal in the Territory to supply the whole of the United States for centuries.

THE Spokane Falls Herald says that the strike of silver chloride on Lake Pend d'Oeille, opposite Hope station, promises to be a very important one, and adds another tributary mining district to the many that surround Spokane Falls. The easiest method of reaching the mines is to leave the Northern Pacific at Hope; here a small boat transports men and supplies across the lake, a distance of 20 miles. The landing-place is at the Squaw Bay Lime Kilns; from this point it is 30 miles to Weber's camp by land.

THE ELLITHORPE AIR-BRAKE CO'S PASSENGER ELEVATOR.

AIR-BRAKE ON ELLITHORPE'S PASSENGER ELEVATOR.

A SHOAL at a depth of 35 fathoms has been found 35 miles southwest of the Farallones islands. It is not marked on the chart and is supposed to have been formed by the earthquake of Sunday last.

It is estimated that the bullion yield of the Comstock lode next month will not fall short of \$900,000, provided there is water sufficient to operate all of the Carson River mills and the Nevada mill electric motor proves a success.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Deway & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Deway & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING NOV. 13, 1888.

- 392,601. — ORR-CRUSHER—J. M. Bryan, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by Deway & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Deway & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DESIGN FOR A BADGE.—Arthur M. Ebbots, S. F. No. 18,730. Dated Nov. 13, 1888. The leading feature of this design is the center-piece in the form of a grizzly bear, encircled by a rim-piece in the form of a laurel wreath. In connection with this is a star at the top of the rim-piece and a scroll plate below the center-piece and encircling the wreath. On this plate is the word "Pioneer." This is intended for a badge for the members of the Society of California Pioneers.

VEHICLE.—Jacob G. Kenyon, Port Kenyon, Humboldt county. No. 392,866. Dated Nov. 13, 1888. This invention consists in the novel construction and arrangement of independent axles or wheel spindles, their bearings, supports and other details. The friction is reduced indirectly by the anti-friction bearings, but also by transferring the friction from the wheel centers, where it usually is in vehicles, to the journals of the spindles. Steadiness and ease of draft are obtained by so mounting the wheels as to more effectually prevent their deflection from a straight line. In the ordinary construction, each wheel being rotary on its spindle, there is a constant tendency to deflection, either by reason of small obstructions or natural looseness, and this tendency produces a cramping and consequent friction which affects the draft; but in this patented construction the inventor claims that each wheel is better controlled by its axle or spindle, which, serving as a lever, is sufficient to resist the deflecting tendency and to keep the wheel perfectly straight.

CONCENTRATING SULPHURETS.—The Virginia Chronicle says: Many new strings of blanket sluices have recently been constructed in Six-

Mile canyon for concentrating sulphurets contained in tailings flowing into the creek from the California and other mills. Con. Cal. and Virginia ore is worked up to above 90 per cent of the pulp assay value, and the tailings from the mill are therefore very thin, but when the Nevada mill begins dropping its 60 stamps the blanket sluicemen expect to make more than minor's wages, as the percentage of loss on Hale and Norcross and Chol-lar ore worked in that mill is greater than that on Con. Cal. and Virginia ore.

At the meeting of the Academy of Sciences on Monday

evening, F. Gutzkow read a paper on "Magnesium Oxochloride, or Sorels White Cement—Favorable Conditions for Making It in California." W. R. Bentley read a paper on "Great Glacier of the Selkirks."

MECHANICAL PROGRESS.

American Mechanical Science in England.

A meeting of the British Association for the Advancement of Science was held in England last month, at which several papers were read, in which the position held by the United States in the matter of applied science in comparison with other countries must be peculiarly gratifying to every American. Much interest was awakened by the exhibition of the phonograph and graphophone, but the most intense interest was manifested when the lately discovered system of

Welding by Electricity

Was exemplified before the audience. The speaker on the occasion was Prof. Ayreton, who had for his subject "The Progress of Electrical Science." In the course of his lecture, a modest young American, Wm. Fish, stepped forward, at a nod from the professor, put two pieces of bar iron, an inch square, into one of the Boston electric welding machines, turned on the electricity, and in a few seconds the pieces so held together, end to end, became white by the intense heat and were made one directly in view of the astonished audience. The act called forth a tremendous round of applause. The young man next put two pieces of gas tube, one inch in diameter, into the machine, and, as the enthusiastic youngsters say, "in less than no time" it was seen that gas coupling could be dispensed with. "Steel is much harder than iron," said Prof. Ayreton. "Possibly, the current may not be strong enough to weld steel, for the engine which drives the dynamo is away off on the other side of the railroad shop, but our American friend will see what he can do with two pieces of steel three-fourths of an inch square."

The audience stood on tiptoe. "Down, down!" shouted those in the rear, but those on the front seats were deaf to all sounds, and intensely alive to what was going on in front.

A half-minute, and then Prof. Ayreton held up the welded steel, white with heat, and the building again broke with applause.

"Aluminium is a metal requiring an intense heat to weld it. Indeed, it cannot be welded except by electricity or the oxy-hydrogen process," said the professor, "and possibly the next experiment may fail," but the Boston electric welding machine was equal to the occasion, and the people went wild when they saw it glowing with whitest heat, the two pieces perfectly joined.

"Never have I seen," said Sir William Thompson, the versatile electrician, "an exhibition of applied science surpassing this in interest. I can see that its outcome is to be a revolution in our industries. It does what never had been done before, and what it was impossible to do by any appliance hitherto in use."

Another paper which awakened great interest was a description of Cowles' American process of electric smelting, obtaining aluminium by using a dynamo, as at Lockport, Ohio. An English gentleman has established works at Milton-on-Trent, using the same process. As aluminium is coming largely into use as an alloy with other metals, the practical members of the association—those who have interests in iron manufacture—pricked up their ears when it was stated that an American manufacturer of stove was using 60 tons of metal a day, in which there was a mixture of aluminium. The gentleman who read the paper said he was not at liberty to say how cheaply aluminium would be obtained by the Cowles process, but it was very cheap.

Still another paper was read showing the wonderful progress which had been made in this country in the way of electric lighting. It appeared to be very freely acknowledged that the United States was far ahead of England in the practical application of electricity to the industries.

IRON IN STRUCTURAL WORK.—In walls, brick of any kind, but more particularly fire-brick, if properly laid in sound mortar or cement, will resist all effects of heat for a considerable time. For stoves, stone is a very dangerous material, unless it is imbedded on some substance which can carry it when it becomes hot. But of all building material there is none which requires more extra care and delicate treatment than iron. Imagine a straight iron rod, supported at its ends, and capable at the ordinary temperature of the atmosphere of carrying a heavy weight in the middle. Let a strong fire be lighted under it; in a few moments the rod will lose its straightness, first sagging in the middle, then dropping altogether, next flaring and running away. Yet this is a material which many persons call fireproof, and put to carrying loaded floors which they designate by the same improper epithet. Wherever iron is used it should be protected by terra-cotta, good brickwork, sound plastering, or if nothing better can be found for the purpose, solid woodwork round it. Woodwork, if solid, will resist for a length of time every possible effort of actual flame.—*Builders' Trade Journal.*

BRASS-ROLLING IN PHILADELPHIA.—Philadelphia is to have a brass-rolling mill. Connecticut has always been the seat of all the large brass-rolling mills of the country. The first copper mines were worked in Connecticut, and since copper and zinc are the component parts of brass, the brass industry was naturally lo-

calized. But the Connecticut copper mines were shut down, and all the copper and zinc, or far the largest part of it, comes from the exhaustless copper deposits of Lake Superior and the zinc mines of Illinois and adjacent States. Pennsylvania finds use for much coal in the industry, and it is estimated that \$20,000,000 worth of rolled brass is consumed in Philadelphia yearly. Waterbury is the great brass-rolling center of Connecticut, and there are also establishments in Ansonia, named after Anson Phelps, the founder of the famous New York metal house.

Popular Belief that Cold Makes Steel Brittle.

Stiffs, Fairhair, Kirkaldy, Webster, the United States Government Commission, the Railroad Commissioners of Massachusetts, and others, all hold that the effect of low temperature upon iron is very slight, and that it does not tend to produce a brittle condition. Sanberg is the only one who claims that low temperature have any pronounced effect in producing brittleness; that is, he is the only one among recognized authorities; but if you have ever been out in the woods on a cold, frosty morning, you may have noticed that the axman warms his ax before beginning work; ask him why he does so, he will reply, "To take the frost out."

Watch the trackman on a cold morning; he is very careful not to strike his cold chisel too hard, and neither does he cut so deeply into the rail, before dropping it to break it, as he does in warm weather; ask him why, he will say, "The chisel and rail are full of frost and will break more easily than in warm weather." The same thing will be noticed with the men who are unloading steel rails, or wheels and axles. They are more careful to let them down easily in cold than they are in warm weather.

You may say, "But that is only a popular fallacy." It may be so, but those men have had some experience which has led them to this opinion, and I am afraid there is more truth than fallacy in their claim "that frost in the iron makes it brittle."—*Ramsay on Effect of Cold on Metals.*

WHEEL TIRES ON PRUSSIAN RAILWAYS.—According to the official statistics of the Prussian railway authorities, there have been during the past year 2552 breakages of wheel tires on the 33 line systems in Prussia of about 37,400 km. in length. In consequence, there were 20 cases of the train leaving the rails and 191 cases of delay. The following were the various causes of the springing taking place: Badness of the material, low temperature, and rapid change of temperature. Concerning the great danger which the springing of wheel tires occasions, the railway authorities are, of course, endeavoring to find some means of obviating all defects by employing the best material and making the tires of great thickness. Formerly the tires were 25 mm. in thickness; now they are given a thickness of 60 mm. and many are constructed of pure weld iron. The breakages have, as a fact, considerably decreased since 1886, in which year 4740 were reported.

TROUBLE WITH PISTON-PACKING AND THE REMEDY.—A correspondent of the *American Machinist*, in speaking of the wearing of the bottom part of a cylinder, says: "I am running a Cammer engine—cylinder 16x36; 100 revolutions per minute. The three first years it ran, the piston-head wore out the bottom of cylinder so much more than the top or sides that it had to be bored out twice, and three different packing-rings tried, with the same results. At last, we extended and ran the piston-rod through the loose head, so it now has an equal bearing each end of cylinder. The result is a great saving of oil, engine ran 13 months, day and night, without visible wearing of cylinder, and without renewing packing."

WHAT METALINE IS.—Metaline is the "trade-mark" name given by the inventor, Dr. Stuart Gwynn, to a series of substances, containing in themselves sufficient lubricating properties to preclude the necessity of using oil or other lubricants, and to him is due the credit of rendering possible and first introducing this new system of journal bearing. The patentee is R. W. Rhodes, 37 Bleeker street, New York. It is considered especially valuable for loose pulleys and all places difficult of access, or liable to be overlooked.

A NOVEL LOCOMOTIVE is on exhibition at Palmyra, Wis. Except the noise of its wheels moving upon iron rails, it is noiseless and smokeless. The steam, after use in the engine, is condensed in a new manner, and the water at the boiling point is reused. All the wheels of this locomotive are drive wheels, being so arranged as to give them easy control of the car on curves and uneven tracks.

IMPROVEMENT IN THE BLOOMING MILL.—In the Soho mill of the Moorhead-McCleane Company, the blooming-mill will be thrown aside by an improvement which dispenses with one process in converting the blooms into sheets. A kelp-mill and a merchant-mill will be added to the establishment.

ONE pound of mercury converted into fulminate is efficient to charge 50,000 percussion caps.

SCIENTIFIC PROGRESS.

Deteriorated Oxygen.

It is a curious fact, discovered by Dr. B. W. Richardson, that pure oxygen becomes devitalized by repeated inhalations. Animals confined in a current of freshly-made pure oxygen were differently affected, but never became sleepy; but when the oxygen once inhaled was freed from all known impurities and again supplied, the animals invariably became drowsy, fell asleep, and under successive inhalations of the purified gas, expired. It was evident that, in breathing, the oxygen had undergone some change unknown to the chemist. What the change is can only be conjectured, though Dr. Richardson has found that if the exhausted oxygen be electrically charged it is revitalized and will again support life.—*Boston Journal of Commerce.*

[The deteriorated oxygen, which as above, would not sustain life, was no doubt deprived of its ozone by being repeatedly passed through the lungs of the animals employed in the experiments. Its subsequent subjection to the action of electricity would restore its ozone and thus revitalize it. It is well known that ozone is always abundantly developed in the atmosphere immediately after a thunder-storm. After such atmospheric disturbance it is readily recognized by its peculiar smell and the invigorating influence it exerts on the human system. Ozone is an allotropic state of oxygen. Common oxygen is passive, but when it exists in its allotropic condition as ozone it is active, invigorating, life-giving. In its ordinary condition even pure oxygen contains but a very small proportion of ozone, and from the above experiments it loses even that by repeated inhalations, and becomes unfitted to sustain life; but, when subsequently subjected to the action of electricity, ozone is abundantly developed and the oxygen again becomes fitted to sustain life. These facts undoubtedly afford an explanation of the "curious fact" alluded to by our Boston cotemporary, which was probably not recognized by the "chemist" who made the experiment.—*Eds. Press.*]

The Pressure Required to Solidify Powdered Metals

In his Cantor lectures, delivered last March, Prof. Chandler Roberts Austen dealt with the formation of solid metals by compressing strongly the powders of the constituent metals. Since 1878 the labors of Prof. Walthers Spring of the University of Liege have been mainly devoted to the study of the effect of compression on various bodies. The particles of a metallic powder left to itself at the ordinary atmospheric pressure will not unite, but by augmenting the points of contact in a powder, the result may be very different. Prof. Austen's experiments were made with the aid of a compression apparatus, in which the metallic powder is placed under a short cylinder of steel, in a cavity in a steel block divided vertically, held together by a collar. The pressure is applied to a cylindrical rod. Under a pressure of 2000 atmospheres on the piston, or 13 tons on the square inch, lead, in the form of filings, becomes compressed into a solid block, in which it is impossible to detect the slightest vestige of the original grains; while, under a pressure of 5000 atmospheres, lead no longer resists the pressure, but flows as if it were liquid through all the cracks of the apparatus, and the piston of the compressor descends to the base of the cylindrical hole, driving the lead before it.

The more interesting results were obtained by Spring with crystalline metals. Bismuth, as is well known, is crystalline and brittle, yet fine powder and bismuth unite under a pressure of 6000 atmospheres into a block very similar to that obtained by fusion, having a crystalline fracture. Tin, when compressed in powder, unites, and if it is made to flow through a hole in the base of the compression apparatus, the wire so formed sometimes, though not always, emits the peculiar "cry" of tin when bent. The following figures show the amount of pressure required to unite the powders of the respective metals. Lead unites at 13 tons per square inch, tin at 19, zinc at 38, antimony at 38, aluminium at 38, bismuth at 38 and copper at 33 tons. Lead flows at 33 tons per square inch, tin at 47 tons.

PERSONAL EXPERIENCE OF AN ELECTRIC SHOCK.—Thinking some of the readers of the *Electrical World* might be interested in a personal experience of a shock by an intermittent current, I will give an account of one that occurred to me. On touching two terminals to close a circuit on some experimental apparatus, I thought, of course, I had grasped the insulation, but the bare end of a flexible wire managed to touch my right-hand finger while I held the binding screw in the other hand. I was instantly thrown down and held perfectly rigid, unable to speak, it seemed to me, for two or three minutes, but probably 20 or 30 seconds would be nearer the actual truth. I felt unconsciously coming on, when suddenly I became

loosened and I lay perfectly limp a moment or so. I got up, but was scarcely able to walk, the pains being greatest in the hips. However, I got a voltmeter and found 140 volts on the circuit, and the alternations or intermittences were 150 per second, while I found my resistance, under the same conditions, to be 4500 ohms. The wire that slipped out of my hand left a burn on my forefinger in the shape of an elliptical hole about 5.32 inches deep, and scarred the flesh about the hole at a radius of one-quarter inch. During the contact I felt difficulty in breathing, but five minutes afterward my skin was all aglow, as if a bath brush and Turkish towel had been used vigorously, while the respiration became full and a trifle quickened. Two days afterward I was all right except a little soreness all over.—*Electrical World.*

Early Art in Various Localities.

No words can adequately describe the decorative richness and the mechanical perfection of such illuminations as those which so thickly crowd the Book of Kells in the Trinity College Library at Dublin, or the Gospels of St. Chad, now in the Chapter Library at Lichfield. The ingenious intricacy of the various interlaced patterns are not only aesthetically beautiful, but give one also a sort of intellectual pleasure akin to that derived from a clever mathematical problem, when one traces the unerring accuracy with which the various strands of the design cross and wind and knot with one another without a false line or an impossible plait occurring anywhere.

One thing is clear about these marvelous patterns, and that is that they were produced by men who were themselves familiar with the working of gold jewelry; motives of ornament clearly derived from gold wire twisted into complicated patterns, are very frequent in the manuscripts, and these very patterns are to be seen in some of the no less wonderful jewelry of early Celtic times.

In the art of prehistoric Greece, exactly the same interchange of motives is to be seen—designs which grew naturally out of the technique of one art were copied in another and quite different class of work. Thus, for example, we see the wire spirals of the jeweler reproduced in the stone reliefs of Mycenae and Orchomenos, and at Tiryns on the walls of the ancient palace were paintings in which every detail, down to the semblance of a fringe along the border, was copied from loom patterns or woven stuffs. The fact is, that man of all ages and of all countries, while passing through a similar stage of artistic development, is led not only to use the same methods of execution, but even to produce the most closely similar designs.

Certain combinations of spirals repeated in geometrical patterns of almost exactly the same type, occur on the gold bosses of pre-Homeric Mycenae, on many pages of seventh and eighth century Irish manuscripts, and among the ornaments of the prehistoric races of Northern America—a curious proof of the general sameness of the human brain, and of the strong tendency which the peculiarities of necessities of certain handicrafts have to suggest certain forms of decoration to the mind of the worker. One peculiarity of the early Celtic illuminations is the absence of gold, either as a ground or as forming part of the pattern. The extreme richness of their effect is produced by the use of color only, and among them it is interesting to find a gorgeous purple carlet, which appears to be a form of the old murex dye, for which the ancient Phoenicians were so celebrated. The murex used by the Celtic scribes can hardly have been imported from Syria, and it is probable that they possessed the secret of extracting the dye from some shellfish which no doubt is still to be found on the coasts of Britain or Ireland, though its special value as a source of pigment has been forgotten.—*Ex.*

UNKNOWN SENSATIONS.—Sound is the sensation produced on us when the vibrations of the air strike on the drum of our ear, writes Sir John Lubbock in the *Popular Science Monthly* for November. When they are few, the sound is deep; as they increase in number, it becomes shriller and shriller; but when they reach 40,000 in a second they cease to be audible. Light is the effect produced on us when waves of light strike on the eye. When four hundred millions of millions of vibrations of ether strike the retina in a second, they produce red, and as the number increases the color passes into orange, then yellow, green, blue and violet. But between 40,000 vibrations in a second and four hundred millions of millions we have no organ of sense capable of receiving the impression. Yet between these limits any number of sensations may exist. We have five senses, and sometimes a fancy that no others are possible. But it is obvious that we cannot measure the infinite by our own narrow limitations. Moreover, looking at the question from the other side, we find in animals complex organs of sense, richly supplied with nerves, but the function of which we are as yet powerless to explain. There may be fifty other senses as different from ours as sound is from light; and even within the boundaries of our own sense there may be endless sounds which we cannot hear, and colors as different as red from green, of which we have no conception. These and a thousand other questions remain for solution. The familiar world which surrounds us may be a totally different place to other animals. To them it may be full of music which we cannot hear, of color which we cannot see, of sensations which we cannot conceive.

GOOD HEALTH.

Monthly Health Report.

Reports have been received by the State Board of Health from 79 localities which return a mortality for the month of October of 902, in an estimated population of 726,850, giving the remarkably small annual death rate of 14.88. This is probably a lower percentage of deaths than will be found in any State within the Union for the month of October. The deaths for the month from infectious diseases, including typhoid fever, did not reach one-tenth of the total mortality, which shows how remarkably free the State is from any epidemic disease with a fatal tendency.

Consumption, as usual, holds the highest place in our mortality record, 143 deaths being attributed to it, an increase over the previous month.

Pneumonia also shows an increase, having caused 47 deaths in October. This may be attributed to the meteorological changes during the month, causing an increased number of persons to be attacked by the disease rather than to any malignity in its type.

Smallpox caused two deaths, both in San Francisco.

Typhoid fever had a fatality of 36, which is a decrease from last report.

Cancer was fatal in 18 instances.

Prevailing Diseases.

Reports received from 84 localities are singularly united in the assertion of the reporters that there was no sickness worth speaking of in their several fields of practice, and this assertion seems founded upon fact when compared with the reports of mortality from acute disease.

Cholera infantum was observed in many localities in sporadic form, and is mentioned in reports from Wheatland, Elsinore, Lodi, Bakersfield, Colfax, Gonzales, Nevada City, Anaheim, Los Angeles, Oakland, Pomona, Salinas, Sacramento, Santa Ana, Santa Rosa and San Francisco. The season is late for this disease to be so prevalent, but may be owing to the increased temperature over normal that prevailed throughout the month.

Diarrhea and dysentery seem also to have been quite marked in several localities. In Sacramento, Nicolaus, Cedarville, Brownsville, Wheatland, Merced, Lakeport, Lockeford, Tulare, Redding, Igo, Lemoore, Lincoln, Williams, Red Bluff, Fresno, Downey, San Bernardino, Benicia, Newcastle, Bodie, San Francisco, and other places, they have been quite noticeable from their frequency, but not from their fatality, as the type has been mild and yielded readily to appropriate remedies.

Scarlet fever was quite prevalent in Sacramento, San Francisco, and several other localities. The type is particularly mild. This form of the disease implies gross carelessness upon the part of parents and guardians in permitting their children to attend school, and in allowing the visits of other children to their homes while the disease is still there. Every case of scarlet fever or scarlatina should be promptly isolated, and no intercourse permitted between the sick and the well until perfect convalescence was established, and the place of sickness thoroughly fumigated and disinfected. Scarlet-fever germs are among all germs most persistent in their tenacity of life; they will live for months, perhaps years, in infected garments, and come forth at some favorable opportunity to reap a harvest of sickness, perhaps death, or, in many instances, to impress a lifelong impairment of bodily strength and vigor. The mildness of the attack is often the precursor of serious disease, and too much care cannot be taken of those affected by scarlet fever in any form, and no words can sufficiently condemn any person who permits the intermingling of the sick, suffering from scarlet fever, with the well, where it is within the bounds of possibility to prevent it.

Smallpox appeared once in the month in Sacramento. As we know not how soon the disease may take on an epidemic character and extensive range, the necessity of immediate vaccination cannot be too earnestly urged. An epidemic wave of this character is slowly but surely passing over these United States, and we cannot escape it except by thorough vaccination and re-vaccination, when it will pass harmlessly by.

Diphtheria when attacking children in the form of croup is more generally fatal. The necessity of taking all possible sanitary measures to prevent the spread of this formidable disease is apparent, or ought to be, to everybody, and yet we see houses crowded with mourning friends where the spores of disease are floating all around them, and if they escape it is not owing to their own prudence, but to the favorable condition of their system. Until such foolish proceedings are forbidden by law, and under a penalty, we may expect diphtheria to be carried from place to place and to take its victims wherever it can find a suitable medium for its development.

The board is now engaged upon the work of ascertaining how far the prevailing diseases among cattle are dangerous to human life, and to what extent they prevail or are likely to affect the food supply of the State.

GROWING TALL BY EXERCISE.—Exercise is generally taken without any direct reference to the increase of height. Thus it often happens that the gymnastic feats chiefly indulged in tend rather to check than to increase the rate of growth. This applies particularly, says Mr.

R. A. Proctor, to the lifting of heavy weights, the use of large dumb-bells, involving comparatively slow movements, and all exercises which tend to increase the supporting power of the spine and leg-bones, even though they be exercises primarily directed to increase the muscular power of the arms. Pulling exercises, though they tend to increase the development of the arms in length as well as in girth, round the forearm chiefly, do not on the whole favor the development of length of limb. Sailors, who from boyhood upward are much employed in pulling and hauling, are on the average short men, though often the development of strength and weight resulting from their active open-air lives is remarkable. We see oftener among them than in other classes brawny chests, shoulders, and upper arms in company with lower limbs which by comparison appear almost stunted. On the other hand, men engaged in hunting or in occupations requiring much walking, running, leaping and the like, acquire well-developed lower limbs, and are on the average taller than other classes.

The Oil Glands.

We clip the following very instructive article from a late number of the *Youth's Companion*: Nearly two and a half millions of sweat glands pour out upon the surface of the body a watery fluid, which aids in keeping the skin soft, and, by its evaporation, in regulating the bodily temperature. Besides these sweat glands, the skin contains the so-called sebaceous glands, that exude an opaque and oily matter. The ducts convey it either directly to the surface or into the upper portion of the hair follicles—the cavities from which the hair proceeds.

The oil is designed to help keep the skin supple, and especially to promote the softness of the hair. These glands are absent from the under part of the feet and hands, and are most abundant in the scalp, face, canal of the ear, and about the nose and mouth. Those in the ear secrete the ear-wax. An excess in the secretion renders the face shiny; a deficiency renders the skin and hair dry and harsh.

The glands are sometimes obstructed when the oil becomes thick, or when there is a neglect of cleanliness. This gives rise to *papule*, or pimples, which, on being pressed out through the narrow mouth of the oil duct, resemble worms or grubs. They are frequently celled *worms*, naturally enough, since the hardened dirt on the outer end looks like a bead; but they are only thickened oil, though occasionally a minute living worm chooses one of them for his abode.

Occasionally the more fluid elements of the oil are absorbed, leaving only the solid, and these harden into cutaneous calculi. Or the obstructed secretions—yellow, half liquid and half solid, like putty or mortar—may form small tumors on the eyebrows, face, neck and head. They should be cut out when small, or destroyed with caustic. Still, their only harm is in the deformity they cause.

The various forms of acne, or pimple, are due to inflammations of these glands. They occur mainly at the period of puberty and in the years immediately following, and are regarded as due to the constitutional changes then in process. There is at that period a languid and torpid condition of the skin, a tendency to the accumulation of sebaceous matter, and a congestion of the coats of the follicles.

The treatment consists in removing any exciting cause that may exist, improving the nutritive power of the skin and the general system, and stimulating the parts affected. There should also be close attention to diet and habits of life.

USEFUL INFORMATION.

FISHING ON DRY LAND.—A late number of the New Orleans *Picayune* says: Standing on the rim of the bayou at New Iberie, I have often watched the floating islands of turf slowly sailing past me. Sometimes one will be so large that I should like to capture it, anchor it somewhere, and set upon it as a Robinson Crusoe. It will be beautiful with its feather grasses arising like an Indian princess' plumes—its silver-green rushes, and in the sun, its white lily-cups or flags of iris floating like a royal standard. Sometimes these floating islands go down the bayou in fleets, thus, after a storm, but whenever seen they are honey voyagers, and are fit to make one go back to the old sweet belief of fairy folk. In truth, they are fragments wind-torn from the "trembling prairie." In winter-time the hunters go out to this prairie, and with a spade dig a hole in it. They dig a foot or two, and then come to water; a fishing line is dropped in this novel well, and they may catch fish all day long.

INDIA INK—HOW MADE.—India-ink is, in fact, Chinese ink, as it originated in China, and is manufactured there. When first made it was composed of lac, a resinous substance deposited by a small insect. Later, a peculiar black stone was found which could be dissolved in water, and still later lac and firwood were burned, and the resulting smoke was gathered on some hard substance and rolled into hells. The same principle is now employed, but the smoke is a little more scientifically handled. In the middle of a big porcelain dish, about two feet in diameter and three or four inches deep, they place a stand of about six inches in diameter, and the same height as the dish. Several

small lamps rest upon the stand, and by means of arms fastened to the sides of the dish, small conical dishes are held just over the lamps. The dish is filled with water almost up to the tops of the lamps' wicks and the lamps are lighted. The smoke condenses on the conical dishes hung over the lamps and is collected in the form of a dense black powder. This powder is placed in a vase and a warmed mixture of nine parts of fish glue and one of animal glue strained into it through a piece of silk held over the month of the vase. The contents of the vase, then being thoroughly stirred, are rolled into balls, wrapped in cloth and immersed in hot water. Kneading, another immersion, and beating with a hammer, follow; the paste is scented, and in the form of long sticks is placed in various shaped molds. Wrapped in paper, the sticks are placed in a dish filled with rice-straw ashes, and in a day or two are thoroughly dried. Rubbing with cloths and brushes serves to clean and polish them, and they are then ready for the market.

ANCIENT CITIES.—Nineveh was 15 miles long, 8 wide, and 40 miles round, with a wall 100 feet high, and thick enough for three chariots abreast. Babylon was 50 miles within the walls, which were 87 feet thick and 350 high, with 100 brazen gates. The Temple of Diana at Ephesus was 420 feet to the support of the roof. It was 100 years in building. The largest of the pyramids is 461 feet high, and 653 on the sides; its base covers 11 acres. The stones are about 30 feet in length, and the layers are 380. It employed 330,000 men in building. The labyrinth in Egypt contains 300 chambers and 250 halls. Thebes, in Egypt, presents ruins 27 miles round. Athens was 25 miles round, and contained 350,000 citizens and 400,000 slaves. The Temple of Delphos was so rich in donations that it was plundered of \$500,000, and Nero carried away 200 statues. The walls of Rome were 13 miles round.—*Our World and Its Wonders*.

SUGAR AS A FIRE KINDLER.—The servant girl who pours kerosene oil on the fire to make it burn up quick seems to be disappearing; but in her place another has made her appearance, with a very different material, to accomplish the same object. It was in Boston, and not long ago, that the mistress of a house, not much given to going into the kitchen, entered one day unexpectedly just in time to catch her kitchen maid in the act of emptying a spoonful of granulated white sugar into the fire. Sugar is exceedingly inflammable, and its application made the fire flash up in excellent shape. The head of the house had noticed that he was called upon to pay for a great many barrels of sugar, and his wife had wondered at the family's enormous consumption of that article, but she did not wonder any more, especially as the girl confessed that she had regularly been using the sugar for a long time.

A "TEST FOR SEWER GAS" has been going the rounds of the papers which deserves notice on account of its misleading character. It consists in exposing to the suspected atmosphere pieces of paper moistened with a solution of sugar of lead, which are supposed to indicate the presence of the dreaded gas by turning black. This test is entirely unreliable, and only indicates the presence of sulphuretted hydrogen, a very disagreeable gas, but not especially dangerous in small quantities. There is no definite test for sewer gas known, and it is much better to avoid all possibilities of its presence than to depend upon any chemical tests for indications of its existence.—*Popular Science News*.

A NOVEL METHOD OF LOCATING A LEAK in a water main was employed recently at Rochester, N. Y., with entire success. The break in the main was known to be between the banks of the river. A solution of bi-permanganate of potash was introduced at a hydrant on the side of the river nearest the reservoir, and observers were stationed on the river along the line of the main. A deep reddish-purple discoloration of the river-water at one point soon made the exact location of the leak apparent.

CORN-COBS PRESSED INTO BUILDING BLOCKS. Building blocks made of corn-cobs form the object of an Italian patent which has been recently issued. The cobs are pressed by machinery into forms similar to bricks, and held together by wire. They are made water-tight by soaking with tar. These molds are very hard and strong. Their weight is less than one-third of that of a hollow brick, and they never get damp.

THE BUTTER COLOR used by nearly all farmers and creameries in increasing the yellow tint of their product is annatto boiled in cotton-seed oil, and although the amount of oil in the mixture is exceedingly small, it comes within the letter of the statute defining oleomargarine, according to a decision of the Commissioner of Internal Revenue.

ACROSS GREENLAND.—The venturesome explorer who recently started from the east coast of Greenland to cross that arctic continent has arrived safely at its eastern shore. Scientists will await with eager interest his report upon this interesting journey—the first ever made across the land of ice and snow.

ONE elephant discovered among the tertiary rocks could not have been less than 16 feet in height.

ENGINEERING NOTES.

Wind-Power for Electric Lighting.

Prof. Blyth recently read before the Glasgow Philosophical Society a paper on the above subject wherein he describes an experiment which he made last summer—the lighting of a cottage in which he spent his vacation by a dynamo driven by a windmill, and charging a storage battery. The windmill used was an old-fashioned style, with four arms at right angles to each other, each of them 13 feet long. There was no especial regulating device. The dynamo was belted directly to the fly-wheel of the mill, and charged 12 cells of storage battery, which supplied the incandescent lamps in the cottage. Prof. Blyth had never used more than ten lamps at once, but he could have used more. With a good breeze, enough electricity could be stored in half a day to supply light for four evenings of three or four hours each.

The lamps used were of eight-candle power. When charging, the current passed through a cut-out that would disconnect them from the dynamo when it ran below a certain speed; so the windmill could be allowed to run all the time, charging the battery when the wind happened to be strong enough. The current had also been used to run a light turning lathe, and Prof. Blyth had begun to make a light carriage to be run by the stored electricity.

The paper opens up a field for ingenuity, comfort and amusement in our homes. By such simple means we could light our houses economically; our light would be better, cooler and healthier than gas or coal-oil lamps; while the current could be utilized for running fans, sewing-machines, etc. Indeed, to the average American, with a little spare time and some small ingenuity, the amusement and instruction of such a plant would more than pay for its expense.

Propulsion of Ships by Air Propellers.

At the last meeting of the British Association for the Advancement of Science, a paper was read by Mr. H. C. Vogt, suggesting the propulsion of ships by means of revolving sails acting in the air. The advantages to be gained over the ordinary form of screw propulsion were summed up as follows:

(1) A saving in engine-power by eliminating the disturbing action of the screw; (2) the form of the ship could be determined with reference to least resistance and seaworthiness only, and the division in water-tight compartments could be complete; (3) the change in trim will be less disadvantageous when the power is applied above the deck than below the center of gravity; (4) the vibrations caused by the screw propeller, which are destructive to the ship and most unpleasant to those on board, will be avoided; (5) the proposed air propeller will utilize the natural wind-power.

The air propeller, as explained by Mr. Vogt, is, in its outer shape, somewhat similar to the ordinary water screw, with sails or blades made of thin sheet steel, having the greatest width near the circumference. The pitch of the blades is capable of being varied in order to utilize the power of the wind, because nearly 80 per cent of the winds, the whole compass round, augment the thrust of the propellers.

A CANAL ACROSS ITALY.—It is proposed to commence a canal upon the northwestern shore of Italy, just above Civita Vecchia, at Castro, and to cut through to Fano on the eastern or Adriatic shore. A glance at the map of Italy will show that in this line two lakes are met, those of Bolsena and Trasimeno, and it is proposed to drain these two lakes, thus securing the area for cultivation. The length of the canal will be about 169 miles, the width of it 110 yards, and its depth is to be about 39 feet, so that ships of any tonnage, and even men-of-war, will be able to pass through it. The cost of the canal is reckoned at \$100,000,000. It is estimated that the work could be completed in five years from its commencement. The Italian journals are highly interested in the project and are taking up the matter warmly, and when the fact of the long sea passage around the south coast of Italy and up the stormy Adriatic to Trieste and Venice is remembered, certainly the canal would be of immense service to the whole of Southern Europe.

A NEW DEVICE FOR UTILIZING A CURRENT OF WATER.—A Russian engineer, M. Tsyn, has invented a new means of utilizing a current of water. The apparatus consists of an endless cable, carrying a series of canvas cones which open and shut like an umbrella. The endless cable passes over a double drum on board a pontoon, and at the other end over a pulley suspended from a buoy. The current opening the cones on the rope moves the cable at a certain speed, and this drives a shaft or drum. On the upper part of the rope the cones are naturally closed by the current to which they present their points. This plan, it is suggested, would serve to raise a certain quantity of water for the purpose of irrigation.

CARBOLIC ACID IN DIPHTHERIA.—M. Roulin has successfully treated 22 cases of diphtheria with carbolic acid as an antiseptic. Nasal douches, consisting of three teaspoonfuls of the crude acid in a quart of water, were employed every hour by means of the ordinary irrigator. Tonics were given internally.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NORTH STAR.—*Ledger*, Nov. 17: We are pleased to announce an important improvement in the prospects of this mine, situated between Sutter Creek and Amador City. It has been in process of development by Sutter Creek men for the past 18 months. After sinking a shaft 600 feet, drifting was commenced. The north drift was run a considerable distance without revealing anything of importance, and work was stopped in this direction. A drift was then started south following the hanging-wall. On Sunday last, after reaching a distance of 85 feet from the shaft, a small vein of quartz was encountered. It required no assay to convince the practical miner that the ore was of a good-paying character. It was of a dark-ribbed nature, plentifully charged with sulphurets. No free gold was visible in the first few parcels of ore extracted, but excellent results were obtained by pounding the rock in a mortar and panning it out. The vein was very small at first—only an inch or two thick—but it widened out as it followed, and by Monday morning it was at least 12 inches thick, and fine flowery gold was visible in many pieces to the naked eye. An assay was made by E. C. Voorheis, which yielded at the rate of \$238 per ton. The strike is considered of vital importance. It is taken as the edge of a chimney of pay ore, and at the depth of 600 feet the discovery of a fair-sized chimney would amount to the practical demonstration of the existence of a permanent mine. It has greatly elated the hopes of the people of Sutter Creek. The ore is much the same in appearance as that of its close neighbor, the South Spring Hill, and indeed, the manner of its discovery was also very similar.

MISCELLANEOUS.—The ten-stamp mill which S. D. R. Stuart has erected on his recently-purchased quartz claim, about six miles east of Sutter Creek, is completed. The ore-chute to the mill has been found defective. The grade is not sufficient to enable the rock to roll down with ease, and it is probable that it will have to be taken out and a tramway put in its place. There is about 50 tons of rock on the dump ready for crushing. The Amador gold mine paid off on the 12th instant, that being its regular pay-day for more than two years. The company commenced with a monthly expense of about \$1500, and have been increasing until now its monthly pay-roll, including contracts on the mill, runs over \$15,000. The foreman has about 40 men on the mine, running drifts, crosscutting, sinking and raising, as well as opening stopes, putting in chutes, so that he can supply the 60-stamp mill, which J. B. White, the contractor, says will be finished and ready to run some time during the month of February.

DRYTOWN.—*Amador Ledger*, Nov. 17: The Governor mill is shut down on account of scarcity of water; some of the miners are also idle. They have commenced drifting at the Cosmopolitan, and some of the hands are laid off in consequence. Marcus Jorgerson is making some improvements on his claim on the creek about a mile above town.

SUTTER CREEK.—The town is all excitement over the rich strike in the North Star. The farther the drift is extended the richer grows the rock. Specimens were taken out to-day which were literally studded with coarse gold. Since last writing the Wildman mine has improved wonderfully at the 600-foot level. There is said to be a 10-foot ledge of good average pay rock. The opinion is gaining ground that they will have one of the best paying mines in the county in a year or so. The mill was stopped last night for want of water. Other mills will soon have to suspend for the same reason unless the water supply increases.

Butte.

A PROMISING CAMP.—*Nevada City Herald*, Nov. 17: A letter from J. H. Higgins, recently of Grass Valley, but who is now employed at the Golden Queo quartz mine at Forbestown, says that camp is very lively and promises to become quite a town. The Golden Queo is putting up a 10-stamp mill. The Stow mine is showing well. Forbestown was a decayed gravel-mining camp till a short time ago, when Hon. W. W. Stow started operations on an undeveloped ledge. Since then prospecting has been lively and indications are good for very rich mines being opened.

Calaveras.

MILL MOVED.—*Calaveras Chronicle*, Nov. 17: The mill at the Comet mine, near San Andreas, is being taken down and will be put up on the Quartz Glen claim near Rich gulch. The mill is a 20-stamp one, but it is the intention of the company operating the Quartz Glen to add 20 stamps more.

RICH ROCK.—We were shown some exceedingly rich rock one day this week, which was taken from the mine owned by Vandel & Zumwalt, on Esperanza creek about six miles from this place. The specimens showed us assayed at the rate of \$100 per ton.

El Dorado.

GRAVEL.—*Placerville Observer*, Nov. 17: The owners of the Chili Ravine mine—L. Landecker, Frank Goyan and Jack Gluas—are in high feather over the discovery of a very rich body of gravel in that mine. The tunnel is in over 1100 feet and they expect soon to reach an immense channel which is known to exist and to be very rich. This bench is looking fine, and, as Jack Gluas says, "is prettiest body dirt hever struck pick hint." We saw a panful washed which yielded nearly 51. The formation of this bench, with every indication that it will hold in depth—if not improve—gives great encouragement as to future results. The Chili has a long life before it.

Inyo.

STRIKE.—*Inyo Independent*, Nov. 17: George Turner is reported to have made a big strike of silver and lead ore in a mine over near Deep Spring lake. He will soon make a shipment of the ore.

MARBLE.—Mr. Israel Luce arrived at the marble quarry last Wednesday from San Francisco. He was accompanied by several expert marble-workers. Mr. Luce will now go on quarrying marble for market.

Monterey.

LOS BURROS.—*Monterey Democrat*, Nov. 17:

About a month ago Wm. Pinkertoo purchased a twelfth interest in the Cruikshank mine, paying therefor \$5000. This week Rev. Mr. Holmes of Pacific Grove offered him \$10,000 for the interest, but we doubt if it could be bought for \$50,000. Mr. Holmes has purchased one-half of Sheriff Graves' interest in Los Burros, and expects to make a trip to the mines first of next week.

Nevada.

THE MANZANITA MINE.—*Transcript*, Nov. 17: By the recent heavy cave of the hydraulic bank at the Manzanita drift claim, which broke down the drifting tunnel for a long distance and buried five tons of steel track rails, about 75 men working in one capacity and another were thrown out of employment. Before the mishap the owners were "on velvet," as one of them expressed it yesterday. They were realizing big profits, and expected to soon double the number of miners so as to have about 80 in all on the three shifts. By this increase of force they thought they would get the old portion of the claim entirely worked out by spring. As it is, they cannot again get into the channel there at an outlay which the probable returns would justify. All labor will be suspended this winter, and when the stormy season is over the work of driving an entirely new tunnel into the easterly part of the claim, where there is a large tract of virgin ground, will begin. The tunnel will have to be started from an incline shaft, necessitating the use of hoisting and pumping machinery.

THE EL DORADO.—The Nevada City Co., engaged in prospecting the El Dorado claim of Delhi district has substantial reason to regard the future of the property with confidence. The ledge struck in the tunnel about 230 feet from the mouth, and which was but four inches thick at that point, is being traced. At last accounts it had widened out to 18 inches and was of good quality.

THE CHAMPION.—The ledge being worked on the 400-foot level of the Champion shows the largest and best body of ore ever seen in the mine. In some places it reaches a width of 17 feet. The ore is of superior grade. The owners have every reason to feel satisfied with the property which they have expended so much money and energy in developing.

THE COLE AND WHITE MINE.—*Herald*, Nov. 16: The above mine is located on Gaston ridge, Washington township, nearly west of the mouth of Canyon creek. It is in a slate formation and the ledge is about eight feet in width. Four feet of the ledge next to the hanging-wall has rock which it is estimated will pay at least \$40 per ton. The owners, from whom the mine took its name, sunk a shaft about 45 feet deep, the rich rock continuing down to that depth. Some time since, Fred Bradley, superintendent of the Spanish mine, took hold of the property and has been engaged in sinking ever since. It is said the rock is improving with depth, and it is confidently believed there is a good mine there.

NEW EUREKA.—*Tidings*, Nov. 17: The hoisting gear of the New Eureka plant does not work well, and improvements, necessitating castings, are to be made. M. C. Taylor will do the work and expects to have it completed in less than a fortnight. In the meantime operations at the mine will be suspended aside from running the pump. Prospectors on Deer creek have struck a two and one-half foot ledge at a depth of 55 feet, which yields some pretty ore. Much lead is shown, and sulphurets, but the latter are of a character which carry very little gold. The vein is in slate formation. Four tons of the ore, reduced by mill process, yielded an average of \$8.60 to the ton.

THE BRUNSWICK AGAIN ATTACHED.—*Transcript*, Nov. 18: Eastern parties have levied an attachment on the Brunswick quartz claim at Grass Valley for a little over \$14,700, and Sheriff Lord has put in Capt. Fitzgerald as keeper. The debt is for money advanced the company to pay for purchase and development work and to raise the attachments recently put upon the property by Messrs. Tilley, Fletcher and Silvester. It is believed that this proceeding will swamp the Brunswick Co., which was never very vigorous financially.

MILLS.—*Nevada City Herald*, Nov. 20: A walk down Deer creek canyon yesterday would have made any resident of this city feel glad. The air was full of music made by quartz-mills. Twenty stamps were running at the Providence, ten at the Champion, two at the Merrifield and ten at the Mountaineer, each and all the mills being in hearing distance of each other.

THE CHAMPION.—The Champion mine is a comparatively new venture. Although the ledge was located and work commenced in 1876, it was only a year ago that the present works were started. The company had previously run a tunnel 3000 feet in length, erected hoisting-works on the north end of the claim and made extensive developments. But it was found that the ledge formed a junction with the Wyoming, and, after protracted litigation, that part of the ground was left idle after an expenditure of \$75,000. Not at all disheartened, the company went back to the creek and commenced operations there. They started in on August 15, 1887. Since that date they have sunk a ten-foot-wide shaft to a depth of 400 feet, erected hoisting-works and a 15-stamp mill, which only has ten stamps in place, however, at present, and done considerable drifting in the different levels. The machinery is all run by water-power and the works are all in first-class shape. There are at present only 28 men employed.

THE PROVIDENCE is keeping 20 stamps running by day on rock from the 1250-foot level. Twenty of the stamps are yet idle, but they will be pounding away after a little. There are 40 stamps, 16 Frue concentrators, a large chlorination-works, and all the appliances necessary to work ores closely. A full force of men will be at work there when everything is ready.

IMPORTANT DEVELOPMENTS PREDICTED.—*Tidings*, Nov. 16: A six-inch plunger pump is being placed in position in the new Eureka shaft. This work completed, sinking will be vigorously prosecuted until the ledge struck in a crosscut is cut by the shaft, where stopping will be commenced. Supt. Weldon predicts important developments in a few months.

THE SUNLIGHT MINE.—*Transcript*, Nov. 16: L. Duterte, the San Francisco mining capitalist, who arrived here Tuesday evening, went yesterday to Washington township to put some men at work on the Sunlight quartz claim, which is situated near the

Eagle Bird at Mayhert. The intention of Mr. Duterte and the other owners is to put up hoisting works and a mill in the spring.

THE NEVADA CITY MINE.—The Eastern Co., which recently leased the Nevada City quartz mine has forwarded to B. N. Shoecraft funds with which to resume work on the mine in case satisfactory terms can be made with the creditors.

Placer.

GRAY EAGLE.—*Placer Herald*, Nov. 17: The Gray Eagle Co. has put up a Cornish pump in the shaft. The new boiler is on the grounds, and the new hoisting works are going up. The old machinery is being replaced by new.

MOUNTAIN GATE.—The owners of the Mountain Gate mine at Damascus, according to the latest report, are running through a reef of rock and expect to strike the channel on the other side.

Shasta.

FROM LOWER SPRINGS.—*Cor. Courier*, Nov. 17: There is but little done in the way of developments of the mines, although considerable gossip is going the rounds, but not applied in the right direction. It is the common prediction now that there will soon be considerable activity in opening up mines and milling ores from the croppings. A good custom-mill in Lower Springs district, with crushers and concentrators adapted for working low and high ores, would be a profitable business for some speculators, and a Godsend to our poor miners, and a double Godsend to Old Shasta town. Shasta is the nearest town to the most of our best mines, and the healthiest town in Shasta county; and it would be reasonably well for every man in this district to take hold and join hands for the determination of showing up some of our fine prospects. We ought to be ashamed to ask capital to come up here and look at the insignificant little holes in the ground with but one place upon the entire ledge that can show milling ore. Show up your mines as well as possible, like the Mountain View mine, Eureka, Daniels, White Oak, Mrs. Wiser's Spanish Ledge, and Illinois Mining Co., who are shipping some very fine ore now to Selby Co. for reduction. All of the above mines have produced splendid ore, and have more in sight. There are plenty of ledges here in this district that would produce shipping ore if properly sorted, and if there were deep shafts sunk upon our productive ledges, there would certainly be deposits of very rich ore.

DEADWOOD.—*Redding Free Press*, Nov. 17: George Klein was in town Thursday, looking as jolly and prosperous as ever. He struck several veins of gold-bearing quartz in his new discovery, which he has named the North Pole mine, and the rock now coming out averages \$46 to the ton. The McDonald Bros. have purchased the Red Diamond mine of B. Lamb, and are sinking on a vein three feet thick, which shows considerable free gold, and is very heavily charged with sulphurets. Joe Falin is crushing some very rich rock taken out of the Vermont mine, which will not work less than \$70 per ton. He has had some heavy rustling in the old mine, but it will reward him in the near future.

TIN.—Some excitement has been caused around Sisson's by a discovery of tin about six miles from that place, north of Black Butte.

Sierra.

BUFFALO MINE.—*Tribune*, Nov. 16: Last Wednesday J. J. Lee, one of the original locators and a principal owner, accompanied by Bert Schlesinger, went up to the Buffalo mine. The boarding-house is completed. The track leading from the tunnel to the mill will be 600 feet in length. The shed over it will be built in V-shape and the roof covered with sheet iron. This work is well under headway and will be completed in a few days. The framework of the mill is up and the machinery is all on the ground. Twenty-five men are employed.

Siskiyou.

RIVER CLAIMS.—*Yreka Journal*, Nov. 17: River miners in the Honolulu and Oak Bar districts still continue to take out pay gravel from the channel, and may possibly be able to work a month longer, if we do not have heavy storms or severe frost before. The heavy rainstorms raise the river to endanger the dams, and if continuing for some time, will cause the miners to pull out their apparatus to prevent danger of being washed away. Heavy frost also stops work, on account of loosening the banks, to render them unsafe for working under. Considerable mining will be carried on at the dry diggings in the high mountain gulches this winter, if sufficient rain or snow is gulched to furnish water for sluicing.

Tuolumne.

RIVER MINE.—*Tuolumne Independent*, Nov. 17: J. R. Moffitt's river mine closed down on Saturday last. They had struck into a part of the mine that had been worked in former days, and the lateness of the season would not justify moving the machinery to new ground. Hence it was deemed best to suspend operations until next summer. It is a very expensive claim to work.

BONANZA.—*Union-Democrat*, Nov. 17: The Bonanza mine, under the control of the present lessees, promises to yield all that can be expected under the best management. The lessees have expended probably \$2500 in purchase of the best machinery and in the most thorough timbering of the works. They have spared no expense to make the work permanent as they have progressed. Before reaching the ground from which they hoped for remuneration, they have picked up 136 ounces of gold—enough to reimburse them for their outlay. The Bonanza is in the hands of men who will develop the mine for permanent results, regardless of the expense of making the works substantial as they proceed.

NEVADA.

Washoe District.

BALTIMORE.—*Virginia Enterprise*, Nov. 17: Crosscutting at several points in the ore found on the 300 level, and upraising from the 300 level to the 200, and saving the ore for reduction.

SAVAGE.—On the 400 level the southeast drift has been advanced 15 feet and continues to porphyry and clay. From the north and south drifts on this level we are stopping ore from the east crosscut near our south boundary. From the 600 to the 750 levels are extracting ore from the old stopes. On the 950 level the east crosscut is being advanced through the old stopes, exposing ore of low grade. Have men

employed on the several levels running prospecting drifts, easing timbers and making repairs in the vertical shaft. Have hoisted during the week 625 tons of ore, and have shipped to the Rock Point mill 570½ tons of ore. Average battery assays, \$21.79 per ton. Have shipped during the week bullion amounting to \$9293.41, and have \$906 in bullion on hand.

CROWN POINT.—West crosscut No. 2 on the 700 level is in 84 feet, of which 50 feet is in vein matter. Passed through 18 feet of quartz, assaying as per report of October 30th—\$16 to \$24 per ton—and 33 feet of porphyry and quartz mixed, yielding low assays. The face is still in porphyry and quartz, with considerable water coming from it. Have started a south drift from the 800 station, which is out 15 feet. Good progress is being made in cutting out the drain in the Sutor drift. Have shipped to the Santiago mill for reduction 262 tons of ore saved in running the 700 drifts. The bullion returns have not yet been received.

BEST AND BELCHER.—300 level: In west crosscut No. 1 at a distance of 120 feet from main north-west drift, winze station has been completed and a new winze was sunk to a depth of 5 feet, passing through ore of fair quality. South drift from bottom of old winze has been extended a distance of 8 feet; total length, 20 feet. Formation, quartz and porphyry, showing some value. 625 level—Main north drift cleaned out and repaired a distance of 25 feet; total length, 550 feet. West crosscut No. 3 on this level has been cleaned out and repaired a distance of 70 feet.

BELCHER.—The 200 north drift from the shaft advanced 15 feet during the week, making the total 146 feet. No change to report of the ground run through. The 160 south drift from Crown Point to meet it advanced 12 feet. Repairs to the pump compartment are finished to the 700 level, and we are now engaged in putting in the incline rope and hope to continue the joint east drift from the 1100 station in a day or two. Good progress is being made in cutting out the drain in the Sutor drift.

CONFIDENCE.—The raise from the 1200 level is now up 21 feet, having been advanced 5 feet during the week. The face still continues in ore of fair quality. Are shipping daily to the Brunswick mill for reduction 179 tons of ore, the average battery sample of which shows a value of \$27.68 per ton.

HALE AND NORCROSS.—On the 800 level the north drift has been advanced 28 feet; total, 70 feet. The south drift has been advanced 35 feet; total, 125 feet. Have men on repairs to the shaft stations and on the several levels, and are now prepared to resume the extraction of ore.

CHILLAR.—The west drift from the shaft, 850 level, is in 85 feet. The west drift from the shaft, 750 level, is in 104 feet; the face is in clay and quartz. The raise in the north drift on the 650 level is up 22 feet, showing quartz giving low assays. The north drift on the 450 level is in 732 feet.

JUSTICE.—The southeast winze is down 38 feet below the 490 level. The bottom of this winze is in ore assaying from \$20 to \$30 per ton. The west drift on the 490 level is in 130 feet from south drift. The face is in hard porphyry.

ALPHA.—The 500 level north lateral drift is north of the shaft 167 feet; the face is in clay and quartz. The south lateral drift on the same level is in south of the shaft 72 feet; the face is in quartz that assays from \$12 to \$20 a ton.

CHALLENGE.—Prospecting in various parts of the mine, and 25 tons of ore daily are being extracted and sent to the Brunswick mill for reduction, the average battery sample of which shows a value of \$27.68 per ton.

ENCHEQUER.—On the 382 level the north lateral drift is in north of the Alpha shaft 495 feet; the face is in clay and porphyry. The east crosscut on the same level is in 231 feet; the face is in porphyry.

GOULD AND CURRY.—200 level: West crosscut from top of upraise from El Dorado (300 level) has been extended 22 feet; total length, 136 feet. Formation, clay and porphyry.

SEG. BELCHER.—Are now engaged in putting the rope in the incline and hope to continue the joint Belcher-Seg. Belcher east drift from the 1100 station in a few days.

YELLOW JACKET.—The hoisting works are working finely, and are shipping ore steadily to the Brunswick mill.

ALTA.—Still stripping the vein on the 900 level by north and south drifts. The mill is running steadily.

ANDES.—Running the north lateral drift on the 350 level, and sinking the winze on the 240 level.

CON. IMPERIAL.—Repairs to the main north lateral drift are still being carried on.

POTOSI.—The south drift, 650 level, is in 585 feet; the face is in clay and porphyry.

BULLION.—There is no change to report in the drifts on the 500 and 640 levels.

SCORPION.—There is no change to report in the work on the 300 level.

Belmont District.

RUNNING.—Belmont *Courier*, Nov. 17: The Monitor-Belmont mill is running satisfactorily. Lessee J. E. Severance shipped on Thursday last 2373 ounces of silver bullion (in two bars), nearly 900 fine. This was the result of three days' run with the aid of only three pans. The mill is still producing good bullion, and Mr. Severance will make regular bullion shipments from this on.

Eureka District.

THE DIAMOND.—*Eureka Sentinel*, Nov. 17: The mine of this name owned by Dan Foley, Denis O'Leary and Morris Brothers is improving right along. We paid the property a visit on Wednesday last. There is perhaps double as much ore in sight now as there was a few months back. Two principal crosscuts have been extended into the ore body 25 and 30 feet respectively. The ore is of good quality at all points. The size of the bonanza has not yet been determined in any direction. At this moment it seems to be the best hope of Eureka district. It makes a better showing than did any of the great Ruby Hill mines, with an equal amount of work and exploration. The geological conditions are also right for a big mine. There is a reasonable chance for the Diamond to be as great a mine as has ever been discovered in Eastern Nevada, but it will take some time to ascertain its full value. The

property is still in the hands of the original owners, who are prosecuting developments in a sale and conservative manner with a small force. Only such ore as is being taken out of the necessary drifts is shipped to defray expenses. There has been no stopping thus far. All of the ore is of good quality, though there are some streaks that are richer than others.

ORE SHIPMENTS.—During the past week ore shipments were made from the following-named mines of the district to the furnaces: From the Hamburg mine, 231 tons; Dunderberg, 160 tons; Jackson, 46; Lord Bryon, 22; Alexandria, 2; Diamond, 16; Geddes & Bertrand, 9; Williamsburg, 5; Pinto, 9; White Pine 6 tons, and Benson 75 pounds. From the Rio Members mine, 36 tons; Ethel, 3 tons; and the Margueretta, 19 tons.

BULLION AND LEAD.—The Eureka Con. M. Co. shipped yesterday eight bars of silver bullion valued at \$10,400, and during the week they shipped 80 tons market lead. The Richmond Co. shipped during the week, 40 tons of silver-lead bullion.

Tucuman District.

GRAND PRIZE.—*Times-Review*, Nov. 16: The water has been lowered a distance of three feet during the past week.

COMMONWEALTH.—100-foot level: North drift from joint crosscut has been advanced 13 feet through clay showing small seams of ore. No. 1 winze from east lateral has been sunk seven feet. Intermediate drift from top of No. 4 chute has been extended 7 feet, showing some good ore. 150-foot level: No. 1 north drift from No. 1 west crosscut has been extended 29 feet, exposing some seams of quartz. Upraise from No. 3 north drift has been extended upward 16 feet, a little water coming in from top of raise. 225-foot level: No. 1 east crosscut at the line has been advanced 9 feet. No. 1 west crosscut at same point has been advanced 10 feet. 300-foot level: Good progress is being made in cutting out the station, which will be finished during the coming week.

NAVAJO.—The crosscut from west vein, 350-foot level, extended 12 feet. South drift from No. 4 crosscut, same level, extended 13 feet. Crosscut from west vein, 150-foot level, extended five feet. The stopes above the 350-foot level are looking well, and are yielding very high-grade ore. On the same vein, 250-foot level, the front stope is being opened and stilled preparatory to stopping; the vein at the point shows considerable native silver. The stopes in other places are looking well. The mill started on Sunday and is running well; the battery has averaged \$308.28.

NEVADA QUEEN.—The mill has been cleaned up and bullion shipped; assay value, \$30,739.43. Ninety tons of concentrating ore have been hoisted, taken from the stopes where the timbering is being done. Work on the new mill is progressing favorably.

FOUND TREASURE.—The timbers in southeast drift, 150-foot level, have been renewed nearly halfway to crosscut from the old shaft. Some ore has been shipped to the reduction works.

NORTH BELLE ISLE.—Intermediate drift from No. 1 winze, 300 level, extended five feet in ore. West crosscut No. 2, 400-foot level, extended 12 feet.

BELLE ISLE.—East crosscut from north drift, 250-foot level, extended seven feet; rock in the face harder.

ARIZONA.

TOMBSTONE DISTRICT.—*Epitaph*, Nov. 17: The Emerald continues to look well and yields about 30 tons of good grade ore per day. The south drift on the 300 level is in about 875 feet, with considerable fair grade ore in the breast. The drift on the 400 level, running in the same direction, is in 917 feet, with about a foot of good ore in the face. The south drift on the 500 is in 1167 feet and appears somewhat broken up, apparently a slip or break in the ledge, and a crosscut has been started west to discover the fault. On the 700 the south drift is in 350 feet and looking very well. The engine for the air compressor to run the Rand drill is in place, and the pipes will all be in within the next week.

LUCKY CUSS.—The fine hoisting works formerly at the Girard have been moved to this mine, and will soon be in operation. The shaft is down 430 feet and will not be sunk much further for the present. The station now being cut out at the 200 will be finished within the next week. Most of the ore now being extracted is taken from the winze between the 300 and 400 levels, and is of good grade. At the Maine and Jonathan about 20 men are employed. In the former mine most of the work is being done above the 700, principally on the 300, with fair results. At the Jonathan the larger portion of the ore comes from the 50-foot level and the surface. The Sulphurets yields about two leads, with back actions of good ore each week. No work is being done in the west side of the Tribute. The Sea Surge is at present looking very well, and the prospects are that proper development will open up a large, good-paying property. The Hirschel continues to improve as depth is reached. Mr. Cook is shipping none but high-grade ore, of which he has quite a quantity on hand and more in the face of the drift. Capt. C. S. Batterman, superintendent of the San Ricardo mines, reports everything in good shape; the concentrating mill running regular and the mine looking well. Major Read reports the mines in the Noon district as looking better than ever. Mr. Louis Gerlock, foreman for Col. Morgan's steam arastras, arrived last Monday from Magdalena. He says that the six arastras are in good working order, and that they are a perfect success.

WATERSVILLE.—The main shaft on the Bunker Hill is down to the 5th level, at which point a station is being opened and timbered. No further sinking will be done until the new machinery is in place. Development work throughout the mine is being pushed as rapidly as the light machinery now in use will permit. The new pipe line from the Huachuca pipe, near the Emerald, will all be laid during the present week. Sufficient ore is being extracted and shipped to pay current and construction expenses.

SILVER KING.—Cor. Florence *Enterprise*, Nov. 17: Several new men have been put on at the mine recently, which would indicate an improvement for the better. Still their number is more than counterbalanced by the number of those leaving.

PACIFIC COAST WEATHER FOR THE WEEK.

EXPLANATION.—C, clear; Cl, cloudy; Fr, fair; Fy, foggy; CM, calm; —, indications too small to measure. Temperature, wind and weather at 12:30 P. M. (Pacific Standard time with amount of rainfall in the preceding 24 hours. T indicates trace of rainfall. Observations taken at 5 P. M. instead of 12 M.

COLORADO.

SEVEN-THIRTY.—Georgetown *Courier*, Nov. 17: An Italian lessee on the Seven-Thirty has an 18-inch vein of 275-ounce ore. The Atlantis of Argentine district is a new shipper of ore mills; \$300 a ton. Howard & Lane are reported to have struck it big in the Beaver lode near the Jo Reynolds. Several small lots were milled from the Pelican last week that returned from \$140 to \$500 per ton. Sixty-four cars of ore were shipped from Georgetown during the month of October, containing 915 tons of ore. Ten tons of \$200-ore from the Mary Foster was milled last week. It was the rock class and looked decidedly rocky. The shipments from Ouray average about 10 cars of ore per week. The value is in the neighborhood of \$125 per ton. The quality of the ore in the lower workings of the Hood is improving. In the breast of the drift is an eight-inch vein of galena and pyrite. New Thomas broke into three-finger widths of ruby and gray copper ore in his lease on the Seven-Thirty a few days ago.

DAKOTA.

RICH TIN STRIKE.—Custer *Chronicle*, Nov. 17: "Julia M." is the euphonic name given to a new tin discovery recently made at Tenderfoot, five miles northwest of this place, by M. J. King, which is said to be the most important strike yet made in that district, which is justly famous for the high order of its tin locations. The Julia M. shows a ledge of four feet of high-grade ore upon the surface for a distance of more than 900 feet, and a shaft sunk 15 feet upon the vein shows at that depth a five-foot vein of ore corresponding in character with the ore found upon the surface. W. W. Challis of that district, who has secured a half-interest in the location, and many others who have examined the property, pronounce it the richest and most important discovery made upon the tin belt this year.

SMELTER.—Deadwood *Pioneer*, Nov. 12: The bins of the Galena smelter are full of ore received from the Queen, Horseshoe, Bullion, Ontario, Hayes and other properties. An experienced miner expresses the belief that the smelter will have a successful career. It is in the hands of practical men, thoroughly acquainted with the resources of the camp, and who had carefully weighed the question before deciding to start the plant up. The mines are capable of furnishing twice the quantity of ore required to keep the plant running, and doubtless it will not be long after this is demonstrated a success before another and larger smelter is started up.

REDUCTION WORKS.—Deadwood *Pioneer*, Nov. 14: The reduction works are just now about the busiest place in the city. Prof. Clark is giving his undivided attention to the progress of the building and placing of machinery as it arrives. A small army of men is employed who are not permitted to be idle either day or night. The building is growing rapidly and will undoubtedly be completed before January 1st. Ore from the Golden Reward is due to begin coming in early next week, and the first run will probably be made on it.

IDAHO.

YREKA DISTRICT.—Wardner *News*, Nov. 17: During the week the teamsters in the employ of the Bunker Hill & Sullivan Co. have been kept busy hauling to the mines the massive new machinery that has recently arrived from the Rison Iron Works, San Francisco. Twenty-two tons have already reached Wardner and an additional amount is now en route. The plant consists of a Duplex air-compressor and Pelton water-wheel, which Superintendent Clement says he expects to have in running order by the last of this month. In connection with the air-compressor the National drill will be used, being its first introduction in Coeur d'Alene. An important addition to the mill will be the erection of a Bulkley injector condenser, one of the best inventions of the age, insuring a large saving of fuel and increase in the power of the engine.

GOLD.—Idaho *World*, Nov. 16: Ben Solomo is at work on a gold-bearing ledge he discovered many years ago. The location is two miles above the head of Plowman's ditch, on the Banner road. The vein is two feet wide and the pay in pockets. The pockets contain good ore. Mr. Solomo thinks he also has good placers near the ledge. D. Ferguson says the crosscut from the 500 level of the Banner mine tapped the vein the other day. The ore is rich where cut, but the drift had not been run any distance on the vein when Dunc left.

PIONEER.—A splendid strike was made the other day in the Pioneer mine. The strike was made in a crosscut run from a raise from the lower level, which, if we remember correctly, is at the depth of 250 feet. The strata are larger and richer than they were in the upper level. The Pioneer is a large ledge, over 90 feet between walls, and is really a porphyry ledge, with innumerable small strata of quartz running through it. The quartz cannot be separated from the porphyry, so the ore, from wall to wall, has been taken out and milled at a handsome profit. After sinking the last level the company prospected a long time for the ledge. The shaft was put down some distance away from the vein.

MONTANA.

AROUND BUTTE AND VICINITY.—Butte *Inter-Mountain*, Nov. 15: Sometime ago it was stated that the Butte & Boston M. Co. had purchased the Owsley ranch for the purpose of erecting a smelter there. It has since transpired that this company did not buy the ground. It is stated the purchaser was Judge A. J. Davis of the First National bank. The Butte & Boston M. Co. has over 600 acres of ground out near the Silver Bow mill, upon which, it is almost definitely stated, they will put up a large smelter and reduction works in the spring. At present this company is putting down two shafts; one on the La Plata and a three-compartment on the Gray Rock. The Narrow Gauge is still being developed by E. H. Irvine and others. Owing to the heavy fall of snow, work has been stopped on the Alice mill, which was damaged by the recent fire. George Tong is again taking out ore on the Goldsmith. His new hoisting machinery works admirably. Nothing new has been developed lately on the Gambetta, but Gen. Leggat says it is holding its own and is being steadily developed.

OUTSIDE NOTES.—A short time ago mention was made in these columns of a rich discovery in the Saturday Night lode in the Cataract district near Basin. This property is being worked by four men, who are driving a tunnel and taking out an excellent grade of gold and gray copper ore. John Wall one of the owners, was in the city yesterday. He brought in with him 75 sacks of ore from this mine and sold it to the Colorado Smelting Co., for which he was paid \$100 per ton. Mr. Wall says mining operations are very active in the district. The ore in that vicinity is mostly gold-bearing and averages throughout about \$20 per ton. It is claimed that the rock is so simple for reduction that it will pay well at this figure.

OPERATIONS AT THE VOLUNTEER.—*Inter-Mountain*, Nov. 10: The 300-foot station of the Volunteer was reached this week and a station cut. Crosscutting is now in progress. It is expected that the vein will be tapped in about two weeks. At the 200-foot level the ore encountered was found in blocks running northeast and southwest in several places, and after investigating this it was discovered to form a solid shape underneath. The ore was a greenish color, as of copper, and it is believed that when the ledge is found at the 300 it will show up in compact form. The superintendent is very hopeful that this month's development will prove the worth of the property.

UTAH.

PARK NOTES.—*Record*, Nov. 17: The leasers of the Woodside have the usual large force of men at work. The two inclines are being driven to a common point and but few feet remain to be cut through. It is expected that the connection will be made in a day or two, when a good circulation of air will be assured. By this connection being made the vein will be exposed for over 300 feet in length and the distance down the vein from the surface to the footwall will be about 100 feet. About 150 tons of the leasers' ore were shipped to market this week.

CAMP CROSSCUTS.—Daily dividend No. 21 of \$37.50, 25 cents a share, for the month of November has been declared, payable on the 30th. Large quantities of good-sized mining timbers and lagging are being hauled to the mines before the heavy storms set in. The large tank for use by the Russell process at the Marsac mill will be finished in about ten days, and if the necessary iron piping, which has been delayed, arrives before then, the process will be running in full blast in a few weeks. The non-arrival of iron piping from the East still delays the starting up of the machinery at the mouth of the Ontario three-mile drain tunnel.

LUCKY BILL DEVELOPMENTS.—Contractor Geo. Burton will keep a force of men at work on the Lucky Bill all winter. The tunnel is in about 775 feet, which gives a depth of 150 to 200 feet under Flagstaff hill. The footwall is of quartzite, and so far as known the hanging is porphyry. Recently a crosscut was started to the northeast at a point about 90 feet back from the tunnel's face. Great hopes are expressed that the Lucky Bill will soon develop into one of the big ore-producers of the camp.

THE CRESCENT'S DOINGS.—The usual force of 85 men is employed at the Crescent mine. The large pump required to relieve the big incline shaft of water is en route from the East, and as soon as it is put in place sinking will be resumed. The concentrator is doing effective work and will continue to as long as very cold weather keeps away. About 4000 tons of concentrating ore are on the dump.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Mining Share Market.

There is not very much activity in the mining share market just now, as it does not seem that any of the large operators are in the field. The market seems to be in the hands of the "chippers." Still, if there is no stock boom there is plenty of work in milling and mining on the Comstock. The *Enterprise* says that in Gold Hill, in the Yellow Jacket, Confidence, Challenge, Imperial, Crown Point, Belcher and Seg. Belcher there will be more work done than in many years past, and they are better prepared to do it. The Justice, Alta, Overman and Benton will also do considerable work. As soon as the water question is solved, the Con. Cal. Va., Ophir, Savage, Hale and Norcross, Chollar and Potosi will be made heavy producers of ore for reduction. There is more ore in sight and stripped for extraction than was ever before known to exist on the lode at any time in its history. This fact is notorious.

At the Yellow Jacket a full complement of men was put to work on the 15th, and shipments of ore to the Santiago mill resumed.

Upon the closing down of the California mill (for lack of water), water will be turned on the Pelton wheel at the bottom of the Chollar shaft and the new electric transmission of power will be tested. It is not believed that a regular run will be made, as doubtless the water is just as short for one as it is for the others of the above-named companies.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Eureka Con., Nov. 17, \$19,400; Savage, 17, \$9293; Con. California and Virginia, 17, \$58,000; Mt. Diablo, 17, \$10,434; Confidence, 17, \$33,732; Tajo (Mexico), 17, \$75,000; Los Probes (Mexico), 17, \$10,000; Germania, 13, \$1771; Hanauer, 14, \$2800; Crescent, 14, \$4950; Germania, 14, \$1749; Hanauer, 15, \$3400; Germania, 15, \$3470; Hanauer, 16, \$3340; Germania, 16, \$1898; Hanauer, 17, \$3450; Germania, 17, \$2029; Hanauer, 18, \$3800; Crescent, 18, \$7150; Moulton, 14, \$14,400; Butte and Boston, 14, \$23,008; Con. California and Virginia, 21, \$64,856.

Lixiviation.

EDITORS PRESS.—In my article on "Lixiviation," published on the 17th inst., the printers have made a few mistakes. I am sure that any candid reader understanding the subject could easily overcome these slight obstacles and reach my meaning; but some readers are not candid, as we have had occasion to observe, and you will do me a kindness by inserting the following corrections: First line in second column: for "of polysulphide" read "hy polysulphide." Fourth and fifth lines in third column: for "in the solution of sulphuric acid has been added to the hypo" read "in the solution, if sulphuric acid has been added to the hypo." Penultimate paragraph: for "so pervade and undermine" read "so pervade and undermine." Nov. 18, 1888. C. H. AARON.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

California Inventors Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Market Reports.

Local Market.

SAN FRANCISCO, Nov. 22, 1888.

Stormy weather the past week interfered to a great extent with outdoor trading, but notwithstanding general business kept remarkably good. The local money market is fairly easy, although merchants are said to be remitting to the East in larger sums than for some time. This is reflected in the strong and high prices ruling for exchange on New York. It is claimed that the remittances will aggregate fully 25 per cent more than last year. This opinion is based on the heavy importation of goods, larger than ever before known. Wholesale jobbers in this city report collections in the interior being much closer than for several years past. This is due to less speculation by farmers and dealers, and also farmers having sold their farm products to better advantage. The banks that loan money on mining stocks report that large sums were placed, but latterly the securities appear to be drifting from the public into stronger hands, those who are not compelled to borrow largely. The cause of the public selling is no doubt due to the fact that the large majority have no faith in the reported ore developments in several of the mines. They appear to labor under the impression that the favorable reports are made to foist stock on the outside. During an active stock campaign or deal, all of \$10,000,000 is invested, with at times this sum reaching a much higher figure.

SILVER—The market the past week showed considerable strength, with sales at 93 3/4 @ 93 1/2 c up to Saturday. On Monday, under advice of an advance in the London market, prices with us were worked up from 94 1/4 to 94 3/4 c. Buyers reported silver bullion scarce and difficult to get, except by bidding well up. There is no doubt in certain quarters there is a growing belief that a much higher range of values will obtain. This opinion is founded on confirmed reports that a movement is on foot to form a syndicate having for its object the controlling of the output of the mines, and also the markets of the world. Since our last issue, heavy snowfalls are reported in Nevada, which is said to give ample water-power to start up the mills on Carson river. There can be no doubt but the general public are distrustful of the large ore developments already made and prospective in several of the Comstock mines, believing that the stories are put out chiefly to influence the stock market. Be that as it may, the reports will soon be either verified or disproved; if verified, there ought to be a large increase in silver bullion, unless the ore increases in gold as the work progresses toward the West or Red lode. There is no denying but the Comstock mines are attracting a larger degree of attention than for several years past. Water was brought into the Tuscarora district the past week, which admits of the concentrators starting up. It is claimed there will be quite an increase in the silver bullion output of the mines in the latter district. The silver mines in British Columbia promise to increase their output at an early day in 1889.

London cables received to-day report silver steady at 43 1/2 d. New York telegrams report that market firm at 94 1/2 c. In our market 94 1/2 c is bid without drawing out sellers. Advances from Virginia City report that the water supply is large and all the mills on the river will soon be reducing ore. The bullion output in next month is expected to exceed \$500,000, but what percentage will be silver it is hard to say.

QUICKSILVER—With the rains an improved home call is reported. The export movement is of fair proportion. Arizona and Nevada are taking more than at this time in 1887.

LEAD—The tone of the market is firmer, owing to a more general opinion that no lower range of values will obtain. Holders are not pressing the market at present prices. The demand is slow, and expected to continue so for some time to come, or until the canners start up the forepart of 1889.

COPPER—From all available information there is no doubt but consumers have become accustomed to the higher level for prices, and are therefore more disposed to take hold. The New York *Engineering and Mining Journal* says: A cable from Paris, dated Nov. 4th, says that the copper syndicate has been reorganized with a capital of \$6,000,000, so as to be thoroughly within the French law, the former syndicate having been made precarious by the law against monopoly. The new company is now regularly organized, and has just concluded an agreement with the Rio Tinto Company to purchase all its product of copper for 15 years to come, instead of three years, as now. Other companies will shortly make a similar contract.

TIN—The dullness reported in last week's issue is continued. The high freights from England to this city, and the firmness of the market there, combined with canners' first wants next season having been met, are the main features in promoting the present dullness.

BORAX—The market is reported very firm. The following from the New York *Commercial Bulletin* throws some light on the present situation: As we have noticed in frequent instances in the past, the tendency of the borax market, under "pool" manipulation, is strongly upward. To-morrow (Thursday) the dealers will again advance their ideas to a basis that will admit of a profit upon the recent quotations of the combination, or say to 8c for concentrated in car lots, 8 1/2 c for refined and 9c for powdered, with an eighth to a quarter cent per lb added for less quantities. The stock of concentrated to-day is estimated to not exceed 500 bags, and the above price is only to cover this quantity in store, as sellers will not book orders for delivery the remainder after the turn is made, as they feel confident that a further appreciation will occur at about that time. The Chas. E. Moody is due about the 10th of the coming month with 150,000 lbs refined, but of this quantity 117,000 lbs have already been sold.

IRON—The market is very dull. Iron workers are offish and not disposed to anticipate their wants. From present appearances it looks as if concessions

will have to be made so as to bring in new business, and this is hardly likely with the market abroad firm and freights at the present high rates. The determination of the Pacific Steamship Co. to have a new iron steamer made abroad is not considered in a favorable light by those who have dealings with the company.

COAL—Confirmatory reports continue to be received that new mines on this coast are being opened up, which, coupled with the increased facilities for enlarging the output of the older mines, cause many to believe that it is only a question of time when the wants of this coast will be met by this coast. Australian cable advices report more vessels on berth for this city. In our market the demand is reported active for all kinds at full prices.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Nov. 22, 1888.—The following are the closing prices the past week:

	Silver in Silver in London.	New York.	Copper.	Lead.	Tin.
Thursday.....	43	93 1/2	81 1/2	45	\$22 35
Friday.....	43	93 1/2	17 35	3 70	22 40
Saturday.....	43	93 1/2	17 50	3 67 1/2	22 35
Monday.....	43 1/2	94	17 50	3 67 1/2	22 35
Tuesday.....	43 1/2	94 1/2	17 35	3 62 1/2	22 35
Wednesday.....	43 1/2	94 1/2	17 00	3 62 1/2	22 40

The market closed as follows: In Lake Ingot copper a November sale of 25,000 lbs was reported at 17 1/2 c. The market seems to be in a shut-down sort of condition. Early future pig lead sold at \$3.65 @ 3.70. The trade cannot run smoothly until the locked-up stock is released from outside interests. Petroleum—Refined was quoted as follows: Bbls, \$7.30; plain cases, \$9.30. Borax was steady, and sales were made at higher rates. California refined sold at 8 1/2 @ 9 c, concentrated at 8 @ 8 1/2 c. Quicksilver was easier at 60 @ 62.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

Prices generally ruling for metals not regularly dealt in on Call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, @—; Biliton Tin, \$24.50 @—; Banca Tin, \$24.25 @ 24.50; Baltimore Copper, \$— @—; Orford Copper, \$16.00 @ 16.25; P. S. C. Copper, @—; Foreign Lead, \$4.75 @ 5.00; Foreign Speltz, \$6.00 @ 6.25; Antimony, \$10.00 @ 13.50.

TIN—Has shown the most irregularity in prices, but has been dull; sales of only 40 tons in all being reported. A decline of 20 points in spot on Monday brought futures to a premium, and this relation has been since maintained; the whole market hardening on Wednesday, and then growing steadily easier, until at the close, prices show a net decline for the week of 50 points on spot, and 15 @ 20 on futures, having recovered slightly from yesterday.

COPPER—Has been extremely dull; the record of sales being again a total blank. The movement of prices has been nominal, therefore, consisting of an advance of a quarter cent in the first half, and a reaction of five to ten points later on.

LEAD—Has been unsettled although dull, with sales of about 250 tons. The first prices were five to ten points higher, and after a loss of ten points on Monday, they have again improved five points; so that the net change is very slight, but shows a fractional advance.

SPELTZ—Has received no attention whatever, all the prices reported being purely nominal.

PIG IRON—There is no change of any importance, the reported "blowing in" of furnaces having a tendency to check the inclination toward higher figures. The supply is quite small, hence steadiness in prices.

STEEL RAILS—There is a better feeling, as inquiries are on the market for at least 100,000 tons from good buyers. Sellers are not inclined to meet the low prices made earlier in the month; however, neither are buyers ready to pay an advance, so that there is a stand-off for the present.

OLD RAILS—The offerings are a little larger, and the feeling slightly easier. Buyers are not bidding over \$23 Spot Philadelphia for T's, and are not anxious for large lots at that figure.

Table of Lowest and Highest Sales in S. F. Stock Exchange.

It is believed that Alaskan coal could be delivered on shipboard at \$2 per ton and freighted to San Diego at \$4.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leifer, Superintendent. Divided into 300,000 shares at \$1 each. Property comprises two locations. Ore assays 57 per cent. average. Coarse gold, solid rock vein from 16 inches to 2 feet wide. Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

Assessment Notices.

William Penn Mill and Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Devil's Gate Mining District, Lyon county, Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 8th day of November, 1888, an Assessment (No. 3) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 59, Nevada Block, No. 309 Montgomery street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 13th day of December, 1888, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 31st day of December, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. J. SCOVILLE, Secretary.

OFFICE—Room 59, No. 309 Montgomery street, San Francisco, California.

Lord of Lorn Gold and Silver Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Gold Hill Mining District, Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 13th day of November, 1888, an Assessment (No. 4) of Ten (10) Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company,

HORACE D. RANLETT,
Ores, Mining, and Commission,
420 Montgomery St., S. F.
BUSINESS MANAGER OF

UNION COPPER MINE, Calaveras Co.,
NEWTON COPPER MINE, Amador Co.
Correspondent as Agent for Smelters in London, Liver-
pool, New York, Boston and Baltimore.

Twenty years experience, in California, purchasing Ores
and dealing in Mines.

Special attention given to management and sales of
mines and purchase and shipment of copper produce

THE BUFFALO CONSOLIDATED GOLD
Mining Company, Sierra City, Cal., Ernest Busch, Su-
perintendent. Stock divided into 600,000 shares at \$1 per
share. The property comprises 5 locations. Ore, finely de-
composed, carries coarse gold. Size of ledge: Tunnel No.
1, 32 ft.; No. 2, 94 ft.; No. 3, 10 ft. Fine black decomposed
rock interspersed with white quartz. New 10-stamp mill run
by a Pelton Wheel, blacksmith shop and boarding house.
Stockholders: Ernest Busch, Hugh Murray, Frank Cook,
J. G. Lee, Henry Carpenter. For further information ap-
ply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

F. H. HAUSMAN,
Gold Mining Properties Bought,
Sold and Developed.

Special machinery of all kinds. We have a large list of Standard Patterns, Gears, Pul-
leys, Boxes, etc. REPAIR WORK SOLICITED.

GUTENBERGER'S ROLLER ORE CRUSHER.

WM. GUTENBERGER, Sacramento Foundry, corner N and Front Sts., Sacramento.

Crush 8 to 10 Tons per Day.
PORTABLE and DURABLE.
WEIGHT, 4 TONS.
It is a Full Fledged Quartz Mill without Gearing,
Cogs or Pulleys.

Power applied direct. Works Ore at Low Cost.
More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and
amalgamating ore, and costs less. All who have used this mill
recommend it highly. Splendid for low-grade ore on account of
low cost of working. The first one crusher used in Durango, Mexi-
co, was built at my shop in Sacramento, and under my patent.
Any infringement on this Patent will be
prosecuted to the full extent of the law.

ELECTRIC DEVELOPMENT COMPANY.
Incandescent & Arc Electric Lights.

Electric Motors, Dynamos, Trams, Elevators, Signals and all kinds of Electrical Systems or lighting and
transmission of power, either direct or with storage Batteries.

For Mines, Hoisting Works, Mills, Reduction Works,
Indoor and Outdoor Illumination of every kind. Gas, Oil and Candles superseded by the

EDISON INCANDESCENT LIGHT,

The only complete and satisfactory Incandescent system. Lights require no attention, and are under complete con-
trol. Over 500,000 lights in use in the United States. SELF-REGULATING ARC LIGHTS turn night
into day and afford a means of working the whole 24 hours; invaluable to contractors and others to whom
time is an object. Estimates and designs on application.

THE "ECLIPSE"
Copying Apparatus.

One thousand copies in black. No
special pen, no special paper, no stencil
required. The "Eclipse" reproduces the
natural handwriting so exceedingly faith-
ful that in most cases "Eclipse" cir-
culars have been taken for ordinary writ-
ten letters. Specimens and circulars on
application.

FELIX F. DAUS & CO.,
698 Broadway, New York

NEW SOUTH WALES.

THE GOVERNMENT OF NEW SOUTH WALES
intend to establish METALLURGICAL WORKS on a
scale sufficiently large for determining, in bulk, the best
methods of treating Ores produced in the Colony.

A SUPERINTENDENT is REQUIRED to erect, con-
trol and direct these Works. He must possess the high-
est qualifications and widest experience, and it will be
his duty to introduce the best methods of treating Ores,
with a view to extract therefrom the metals and other
substances possessing an economic value. He would
also have to impart full instruction in the various
methods of treatment, and to afford every facility to
Smelters and Miners for acquiring a practical knowledge
of the processes employed.

Applications, stating Candidate's age, accompanied by
copies of testimonials, must be sent, on or before the
12th of December, 1888, to The Agent-General for New
South Wales, 5, Westminster Chambers, London, S. W.

SAUL SAMUEL,

The Agent-General for New South Wales.

1st November, 1888.

| 1. It is cheaper. | 5. Its "clean-up" is quicker and fuller. |
| 2. It is more durable. | 6. It is portable, requires no frame-work, |
| 3. It crushes a larger amount of ore with less power. | and is ready for the foundation as it leaves the shop. |
| 4. It amalgamates a larger percentage of the gold. | |

Full Descriptive Circulars of any of the above sent on application.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

Risdon Iron Works, San Francisco.—GENTLEMEN: Our Company has been operating three of the 4-foot Bryan Roller Quartz Mills one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60-mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screen 12 tons in twenty-four hours; through 50-mesh, 15 tons; and through 40-mesh, 18 tons. This proportion has been continuous. One set of Dies will crush from 1500 to 1600 tons. One set

of Tyres will crush 1500 tons. One ring plate will crush from 2200 to 2300. The mills require very little attention. At our mill an ordinary "peon" earning one dollar per day has complete charge. In regard to cleaning, in comparison with stamps by reason of the discharge surface and the continuous agitation by the scrapers, a much less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success and of material benefit to the mining world. They can be set up and running in 48 hours, and can be dismantled in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator, it is unequaled by any mill now in existence.

Yours truly,

D. M. BURNS, Superintendent.

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

THE "TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machine, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insure their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering each letter of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

Electric-Power in Mining.

A test run on trial of the Nevada 60-stamp mill was made on Saturday, with electric power generated by dynamos, operated by Pelton water-wheels, on the Sutro-tunnel level of the Chollar incline, 1700 feet below the surface, and transmitted by a copper wire to motors on the surface. It was satisfactory in every respect. The plant is the largest of the kind in the world. We shall shortly give a detailed description of the plant. The success of this experiment is considered of vast importance to the future of the Comstock, as the water-power of the Truckee river can be brought to Virginia City with a loss of only 40 per cent of its original power. The Truckee river is distant but 16 miles in an air line, and by taking advantage of its fall, a thousand stamps can be operated on the Comstock at a cost which will make it profitable to handle millions of tons of low-grade ore.

Electricity is also employed successfully at the Veteran tunnel, Aspen, Col., in hoisting and other works. At that place the dynamo is run, too, by a Pelton water-wheel, giving a good deal more power even than is required. The supply of water to the wheel is automatically regulated. The generating plant is 1½ miles from the motors. A motor and hoist are placed 1000 feet in from the mouth of the tunnel. The speed and power of the motor are controlled by a single switch.

This plant has been in use for some months and has given perfect satisfaction as regards economy and promptness of operation; besides the hoist it pulls in the loaded or empty cars, and controls the speed of all the trains running on the tramway and in the tunnel. Formerly one man was required to each car, making the round trip in 20 minutes; but now the entire train is sent out and returned in eight minutes. Twenty cars are handled rapidly and continuously if necessary.

It will also shortly be utilized for hoisting in the incline running from the Veteran tunnel to the workings of the Franklin mine, 200 feet below. A duplicate of this plant will shortly be erected in another portion of the Veteran tunnel, where a station is cut out to receive it. Another Sprague motor and plant will soon be supplied in the Regent mine.

The utilization of electricity for power in this way has opened a very large field of usefulness for the Pelton water-wheel, which is considered one of the most important inventions California has contributed to the world of mechanics. It takes up so little room, and does its work so well, with so little loss of power, that its fame is now world-wide, and it is in use in most countries where mining is carried on.

ON Tuesday afternoon the fly-wheel of the Bullion mine hoisting engine on the Comstock burst while the cage was being brought to the surface. The cage went crashing in the sheaves, ripping a section off the hoisting works roof. Fragments of the fly-wheel were hurled in every direction, but no one was injured.

M. R. EVANS has developed what promises to be valuable clay and ochre beds in Thistle canyon. Samples he was showing yesterday would make excellent Rochelle ochre, and good, cheap Venetian red.

It is rumored that reduction works to cost \$1,500,000 are to be erected on the Comstock.

MINING CO. WEEKLY REPORTS.—Mannel Eyre has filed suits in the Superior Court against the Directors of the Challenge Consolidated and the Consolidated Imperial Mining Cos. Eyre avers that he is a stockholder in

ON the night of November 17th a slide occurred at the back of the Lost Confidence mine, on Iron mountain, Shasta county, which buried the new roasting works and machinery 70 feet deep, and it is feared that the whole

VIEW ON UPPER PORTION OF THE INCLINE RAILWAY.

both companies, and that the directors have neglected to comply with the legislative Act requiring directors of mining companies to post in a conspicuous place in the company's office a weekly report of receipts and disbursements, and also the report of the superintendent. He sues to recover \$1000 damages from each company for the neglect. Eyre is the plaintiff in eight or ten similar suits against other mining companies.

plant is destroyed. The company had dug about 30 feet into the hill for the purpose of opening out a good site for its mill, having perfect faith in the security of the location. Damages estimated at \$7000.

A DISPATCH from Albany, Oregon, says that Philadelphia capitalists are about to open and develop the coal deposits on the Santiam river, in Linn county.

An Incline Railway.

Among the engineering plants with new features and deserving details which are being brought to the working stage in the Southern States, one of great interest is the incline railway, built from the base to the summit of Lookout mountain, near Chattanooga, Tennessee. As compared with other inclines employed to overcome mountain heights, this work is a new departure, and the details by which many of the problems that vex the mining engineer also are cleverly solved will prove interesting. The railway is described by W. H. Adams before the American Institute of Mining Engineers, the details having been given by Major W. R. King, U. S. Engineer, who projected the road and saw it completed under his own supervision.

By reference to Fig. 1 (page 361), showing the railway in plan and profile, with cuts, fills, trestles, etc., it will be seen that the line is straight for 1250 feet, commencing at the base, curves to the left for 250 feet, thence runs in a tangent about 800 feet (which distance covers the switches or passing-points for the cars), thence curves to the right for 1400 feet, and finishes with a stretch of straight line for 600 feet to the base of bare rock which marks the crest of the mountain, 1500 feet above the river level. The length of the track is 4360 feet, and the elevation attained is 1170 feet, or, say one foot of rise to 3½ of length. The problems required to be solved, the difficulties encountered in the nature of the surface, and the methods of overcoming all obstacles will be partially appreciated by reference to plans and photographs.

Cable lines in cities are the nearest approach to the methods here employed, but a close study of the special features which mark this new departure for surface working will be of particular benefit to those engaged in mine engineering.

Midway on the plan (Fig. 1 enlarged in Fig. 2) the outer rails are shown as diverging, and the central rail opens out or doubles for a distance of 200 feet, forming two independent tracks or switches. This very unusual plan of a three-rail road, from end to end, was adopted for many reasons. No movable parts are used at any point on the track, and solidity is assured by the extra width of the roadbed. Sufficient space and play are given for the rapidly moving cables to hold the center of the separated tracks at all times, the grooved guide-wheels, carefully spaced, holding the cars to the curves as evenly and truly as on the straight track.

The view on this page is on the upper portion of the incline, showing a car crossing one of the trestles. The oblique wheels carrying the cable are also seen. As this illustration is a Levy-type from a photographic negative taken on a bright day, the shadows of the two cables are very distinct. They should not be mistaken for extra cables. In the PRESS of next week we shall give further details of this peculiar mountain railroad.

THE reported sale of the Cuyamaca & Eastern railroad, San Diego county, to the Union Pacific is confirmed at San Diego by a very high official of the Santa Fe, who claims to know that the transaction is consummated; also by a Chicago, Burlington & Quincy official now in California.

THE export of salt from Syracuse is now one train daily, the present tonnage being at the rate of 2500 tons per month.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Concrete.

History of its Manufacture.

[Written for the Press.]

By the term cements is meant in architecture certain substances which by their interposition cause the surfaces of solid bodies to adhere together or unite, the action being either mechanical or chemical, or both. Four thousand years ago the Egyptians not only used common mortar in the construction of their buildings, but could make a mixture which would set and harden under water.

In the Pyramid of Cheops a mixture of Nile mud and gypsum is supposed to have been used. In addition to this, the analysis made by Dr. Malcomson of Madras gives a proportion of 18½ per cent soluble salts, principally the sulphate of lime; a small quantity of the sulphate of soda, and a trace of the muriate. These last no doubt were derived from the impure water which is still found in the neighborhood of the pyramids. At Nineveh the pictures in bas-relief and foundations were chiefly composed of alabaster. The Babylonians not having this material, made bricks and covered them with plaster. The Bible tells us that it was upon the plaster of the wall in Belshazzar's palace that the mystic writing appeared. The Greeks, whose civilization anticipated that of the Romans, used various mortars and cements as seen at present in the remains of their ancient temples. It remained for the Romans, however, to advance the arts of architecture and engineering, bringing them to a perfection hitherto unknown.

For the Construction of Piers and Harbors

In the Mediterranean, they used a concrete composed of broken stones and mortar. Among their stutest monuments may be mentioned the mols or breakwater at Pozzuoli. It was composed of 24 arches sustained upon piers built of brick and faced with stone. These were held together by a material to which they gave the name of Pozzuolana, which they used in conjunction with lime. In the ancient work of Vitruvius we find the following: "There is found in the neighborhood of Baë, and the municipal land lying at the foot of Vesuvius, a kind of powder which produces admirable effects when mixed with lime and small stones. It has not only the advantage of giving great solidity to common buildings, but possesses the further property of forming masses of masonry which harden under water." The piers were built more than 1800 years ago. Thirteen of them still remain, and had the first breaks been repaired, the structure would have remained complete until the present day. The arch construction was ingeniously contrived to prevent the accumulation of sand behind the mole.

To this day, in the south of Europe, lime when slacked is put in boxes and kept for a long time, the idea being that greater strength is gained by it for the purpose of imparting increased hydraulic energy to pozzuolanas.

In Vichat's treatise on calcareous mortars and cements (1837) I find the following description in his preface of concrete, as known and used previous to his time of writing: "The art of

Composing Calcareous Cement

Was confined, till within the last few years, to the knowledge of a small number of facts, and to the observance of certain rules long since admitted into use without examination on the authority of Vitruvius and the architects who followed him. But the rules were always found to be at fault, and the facts for want of correlativeness were of but little aid. * * * It was not the less necessary to work by guess in most instances, or to trust to obscure analogy for the success of the most important work."

The hydraulic cements chiefly employed in Europe are the Roman, Portland, Medina, Mulgrave and those made on the Continent from Pozzuolana, Trass, Santorin and Teil lime. The first modern Roman cement was made by Mr. Parker of London, who patented his process in 1796. All Roman cement contains a marked quantity of iron, as may be seen from the following analysis:

	1	2	3	4
Lime.....	55.33	55.50	47.83	53.88
Magnesia.....	5.00	1.73	2.4	2.25
Silicic acid.....	23.83	25.01	8.83	23.60
Alumina.....	6.41	9.03	1.61	7.24
Oxide of iron.....	4.80	9.63	29.80	7.97

English Roman cement is now made from a clay shale found above the chalk formation on the Isles of Sheppy and Wight. It is, therefore, a natural cement. Mr. Parker made it from nodules termed "septaria," found in Kimmeridge and London clay. These were calcined almost to the point of vitrification, and then crushed to a fine powder without admixture of any other material.

The English and German methods differ somewhat. I may call them the wet and the dry. In England, the method consists in mixing the materials together with water, and then grinding them to a pulp, which, after evaporation to a proper consistence, is made into bricks which are dried and then calcined to near the point of vitrification, after which they are ground to a fine powder. The proportions of

the ingredients are from 65 to 75 per cent of chalk to 25 or 35 per cent of clay.

Portland Cement.

Which is the main ingredient in the manufacture of the concrete of this present day, is an artificial production, and is so called from its resemblance to Portland stones. It was first manufactured by Joseph Aspdin of Leeds, England. His patents, granted in 1824, have been much improved upon. Mr. Aspdin's method was to pulverize this limestone and burn it in a kiln, then to add an equal weight of clay and thoroughly knead the mixture with water to a plastic mass, which was dried, broken in pieces and again burnt to expel all the carbonic acid. Of late years, however, it has been found that it is better to have the lime in a state of carbonate, when it is mixed with the proper clay, and accordingly chalk has been used instead of limestone on account of its cheapness and the facility of procuring it.

The German Method

Consists in first drying the materials and separately reducing them to powder. They are then mixed with water in the proper proportion and made into bricks, which are then dried, calcined and ground. A small amount of alkali is also added, either soda or potash, depending upon the amount already contained in the clay. By thus bringing the amount to about 5 per cent of the whole, a soluble silicate is formed which will act upon the lime in setting. Occasionally also a small quantity of ground quartz or sand is added. The following is an analysis of four varieties of Portland cement as given by Michaelis: 1 and 4 are English P. cements, 2 is made at Stettin, 3 at Wildau:

	1	2	3	4
Lime.....	59.06	62.81	60.33	55.06
Silicic acid.....	24.07	23.22	25.98	22.92
Alumina.....	6.92	8.37	7.04	8.00
Oxide of iron.....	3.41	2.00	2.46	5.46
Magnesia.....	0.82	1.14	0.23	0.77
Potash.....	0.73	1.27	0.94	1.13
Soda.....	0.87	0.30	0.30	1.70
Sulphate of lime.....	2.85	1.30	1.52	1.75
Clay sand.....	1.47	2.54	1.04	2.27

Trass or Teras is a substance very like Pozzuolana. It is a blue-black trap rock found in the valley of the Rhine; it is of volcanic origin also, and can be treated with lime in a similar manner to the Italian product. It is much used by the Dutch engineers for hydraulic works in Holland. Wagner gives the following table of comparative analysis:

Constituents.	Pozzuolana.	Trass Soluble in H C	Trass Insoluble in H C
Silica.....	44.5	11.50	37.44
Lime.....	8.8	3.16	2.25
Magnesia.....	4.7	2.15	0.27
Potash.....	5	0.29	0.05
Soda.....	1.5	2.44	1.12
Alumina.....	15.0	17.70	1.25
Oxide of iron.....	12.0	11.17	0.75
Water.....	9.2	7.65
Totals.....	99.7	56.06	43.16

I give the analysis of these clays in order that the attention of miners and prospectors may be drawn to them. There is an amount of similar material in California. Its discovery and the establishment of manufactories on this coast is but a question of time.

General Pasley is looked upon as the founder of artificial-cement manufacture in England. During the year 1826 he experimented with mud taken from the River Medway, burning it with limestone or chalk. This mud having argillaceous properties and containing sodium salts, was well adapted for the purpose. Other materials are now used, such as marls mixed with clay and usually the deposits at the deltas of rivers.

At Teil, in the Department of Ardeche, in France, a hydraulic lime has been found which possesses properties that eminently qualify it for use in marine construction, as it eats and hardens well under salt water.

Rivot gives the following analysis:

THE UNBURNED STONE.	
Lime.....	46.3
Oxide of iron.....	0.7
Silica, quartz, sand and clay.....	15.0
Carbonic acid and water.....	37.6
Total.....	99.6

THE BURNED STONE.	
Lime.....	78.29
Oxide of iron.....	trace
Silica.....	38.20
Alumina.....	1.80
Quartz sand.....	1.71
Total.....	100

At Port Said, the terminus of the Suez canal, the concrete was made of the Teil cement mixed with beach sand. This was formed into blocks, which were exposed for several weeks to the action of the air, before being laid in their places.

W. G. HODSON.

(To be Continued.)

Amador County Mines.

[From Our Traveling Correspondent.]

In Amador county the mining interest seems to be increasing. While the larger mines are working about as usual with few exceptions, smaller companies are in most cases increasing their capacities and finding some paying ore.

News concerning some of the larger mines is easy of access, especially those which happen to be conveniently located, while others of vastly more importance are seldom, if ever, mentioned.

This will continue to be true so long as the present relations between managers and weak stockholders exist.

Intelligence concerning some of the smaller

claims will perhaps convey a better idea of the general outlook than even a detailed repetition of news concerning a few of the larger ones only.

At Jackson

The Zeils had recently been sinking 250 feet. The outlook in the drifts is fair. Of course nothing definite can be learned from the extension of the shaft until the vein is tapped.

The Amador has also been sinking. At this claim there are three shafts. Work is progressing finely, with a favorable outlook.

Reed & Askey are erecting a ten-stamp mill in place of the five-stamp mill formerly used. This mill will be run by a large wheel placed in the center of the channel.

Much interest is manifested in the Trip mine, on the Mokelumne, near Big Bar bridge. The quartz ledge is about 12 feet wide, and looks as though it would pay well for these times. None of the ore has yet been crushed. The company is building a ten-stamp mill, which will be run by water taken from the river not more than 1000 feet above. A tunnel is being run in, raising from the end, to connect with the shaft, which is now down about 80 feet. The tunnel will be about 300 feet long.

Extensive improvements have recently been made at the Kennedy, and the outlook is good.

The Live-Oak,

A small mine, owned by Thomas & Parker, is one of those few quartz mines which has furnished its own capital. The owners began about three years ago and have made the mine pay its own way from the first. Their mill and pump are run with a four foot wheel, which requires but 10 inches of water with a pressure of 200 feet. They are now down about 175 feet. The shaft inclines to the southeast about 30 degrees from perpendicular, with but little variation. With a three-inch Jack Head Garrett pump worked only about six hours in the 24, the water is kept out. This pump is connected with the water-wheel by means of a wire rope, running over pulleys. The mill is about 150 feet from the shaft below. They are at present drifting. The lead has been from four to five feet wide. In the bottom drift it is 18 to 20 inches wide, while at the bottom of the dump, 12 feet below, it is about four feet wide. This ore averages about \$10 to the ton, including sulphurets. A second shaft has been sunk, 40 feet from the first, where a new lead has been tapped, which pays in the neighborhood of \$75 per ton. They will tap the second from the first at 120 feet, and work from the first. The second shaft is now down 80 feet only.

Mr. Thomas has spent most of his life in the mining business, and he says this is the most regularly formed lead he has ever seen.

Pine Grove.

McKenzie Bros., at Pine Grove, have been running a Huntington rotary mill with good success that the second mill like the first will soon be in operation. They are working large veins of low-grade ore.

At Volcano, as well as at Pine Grove, the winter water will be utilized to a good advantage.

At Sutter Creek

The Wildman Company have recently been sinking 100 feet. The shaft is now down 600 feet. They have drifted south and are now crosscutting east and west. They have recently discovered ore that they think will pay well.

Mr. Knight, the inventor of Knight's water-wheel, the hydraulic pump, etc., is working a full crew of men on full time. The demand for his wheels is increasing. Three of his pumps are now in use and giving good satisfaction.

Mr. S. D. R. Stewart, eight miles out on Sutter creek, is putting in a six-stamp mill.

At Amador City most of the principal mines in the locality are running about as usual.

Compressing Air.

In riding from Sutter Creek to Amador City, an observing person will notice near Walkmaster & Brinn's planing-mill and ice factory a small building in which machinery is running. While this machinery, being in sight of no mine, appears to be connected with nothing beyond the building, a stranger will be somewhat surprised on investigating to learn that a Knight water-wheel is here used to compress air. This is only a six-foot wheel and develops a hundred-horse power. This compressed air is piped to the South Spring Hill mine, where it is used in the mine to propel four rock drills. The mine is not less than half a mile away from the compressor. This water is again used for running a stamp-mill and hoisting works.

At the Gravel

They are about to change from steam-power to water. They are putting in a 15-inch, extra heavy, steel pipe. This pipe leads from a large reservoir 1½ miles away, with a fall of 428 feet to the mile. This reservoir is 30 feet deep in the deepest place, and will, no doubt, keep in store a large quantity of water, which will be supplied by the Blue Lake Water Co.

The shaft at this mine is down 1000 feet. It has a double track on a uniform grade, inclining about 65°. The hoisting is now done with steam. There is a drift at 200 feet, north 126 feet. The ledge here is 35 feet wide. They are now stopping it. At this point there is communication with the south shaft. There are also communications at 300 feet, 600 feet and 700 feet. There is a drift north at 500 feet, 175

feet. They are now raising in this 500-foot drift with fine prospects. A straight track leads from this shaft to this mill, a distance of 1000 feet, with sufficient grade to allow the loaded car to draw the empty car up. This company runs a 20-stamp mill. The ore at present pays \$5 to \$8 per ton, including sulphates.

Mr. Cull, the superintendent, tells us that the bonds are all cleared, that the company owns 160 acres of the surrounding land with both an agricultural and a mining claim, and has 3000 feet of claim under control.

Drytown.

At the Cosmopolitan mine the shaft is now down 550 feet. The outlook is good. They have 400 feet of crosscuts and drifts. This is practically a new mine, owned by a Boston company which has recently erected new works.

At Plymouth

The New London has been making some extensive repairs. At the Plymouth Consolidated they are hoisting out this water. The people of this vicinity are anxiously awaiting the time when work will be resumed in their mine.

D.

Interesting and Unusual Association of California Minerals.

[Written for the Press by HENRY G. HANKS.]

During a recent visit to Plumas county, the attention of the writer was called by Mr. J. A. Edman to a heavy, dark-colored mineral, sparkling with light, reflected from brilliant faces of minute black crystals. Were it not for the microscope the beauty of these forms could not be known. A chemical and microscopic examination of this rare specimen showed the crystals to be magnetite, imbedded in a matrix of hematite.

The following are the reactions obtained, and the properties of the mineral: Color, imperfect red; specific gravity, 4.4; hardness, 5; streak, blood red; luster, almost metallic when held in certain lights. Easily decomposed by boiling hydrochloric acid, leaving a residue of silica. Attracts the magnet strongly, but does not possess polarity. A mechanical analysis gave the following result:

Magnetite.....	40.1
Hematite.....	36.9
Silica and a little water.....	23.0

Total.....100.0

While separating the magnetic portion, much difficulty was experienced, when the pulverized mineral was dry, because the magnetic particles lifted mechanically those which were not; but perfect success was the result of a second attempt, made in the presence of a considerable quantity of water. By frequent repetitions the magnetite was wholly separated.

A microscopic examination showed the crystals to be perfect octahedrons varying in size from 0.004 to 0.025 inches. The faces were reflective and brilliant. The magnetic portion was found to consist wholly of these crystals, many unbroken, although the pulverized mineral had been passed through a 40 mesh sieve. These very interesting minerals occur in a stratum or vein of slate lying parallel with and distant about 300 feet from the Diadem gold mine. The slate is the west country, is 60 feet wide and also parallel with the strike of the mineral vein.

The slate also contains magnetite in minute octahedrons. The mineral stratum containing the hematite is irregular, varying in width from four inches to two feet. When it widens, quartz and specular iron occur with the hematite and magnetite.

"Blind Leaders."

[The following incisive letter was accidentally mislaid, which must account for the delay in publication.—Eds. Press.]

EDITORS PRESS:—It would seem, from letters and extracts in the MINING AND SCIENTIFIC PRESS, that metaphysical discussions are not out of place in that valuable journal; although, as those I have observed are conducted mainly on the *ipse dixit* system of argument—the only one, by the way, which admits of the conclusions arrived at—they do not, perhaps, deserve serious notice. However, if you deem the following remarks from a workingman who pretends to no special qualifications for the task, worthy of the honor, I shall be thankful for their insertion in your columns.

It is, doubtless, a little hard on professors of physical science, that conclusions deduced after long and laborious investigation should be objected to, simply because they happen to conflict with the religious belief which is the chief safeguard of millions of the unfortunate and the helpless of humanity, against despair and its terrible consequences, not to speak of its restraining effect as regards crime; but when we remember how little is really proved as a foundation for their stupendous superstructure of speculation, and how widely these same professors differ among themselves, while diametrically opposed to others of at least equal eminence, we may, I think, reasonably be excused from assuming the awful responsibility of disseminating or even believing in such doctrines. Besides, when we see an exponent, like Mr. Huxley, of certain theories deliberately descend to the use of the most egregious fallacies, to insult all that his fellow-men, including the most brilliant intellects of the human race, hold most sacred, we must naturally conclude that

he is not a scientist, but simply an unprincipled sophist; though, certainly, among educated men, a very harmless one indeed. Take for instance that remarkable extract from his works appearing in a late number of the Press, where he claims, in effect, that no scientist would expect belief for a theory based on anything so ridiculously incredible as certain of the miracles recorded in the New Testament. Now it should be superfluous to point out that these latter form merely a question of historical fact, testified to by eye-witnesses, many of whom forfeited their lives to prove their truth—surely verification enough for the ordinary common sense of mankind, as the event has proved, however "immoral" the belief may seem to whatever does duty for a conscience with Mr. Huxley; and any scientific theory admitting of proof equally cogent may be regarded as settled for all time.

Perhaps, if men like Mr. Huxley were to apply themselves, for a time, to elementary studies in logic, and in the exact sciences, they would realize what is meant by proof of a theory. They might also learn of a more advanced stage—if their mental caliber enabled them to reach it—something wherewith to tone down the "big head" with which they seem afflicted. They might realize the narrow limits of human knowledge, which fails to penetrate to the essence even of what seems the creation of the mind itself, to say nothing of external things; and which, in its widest and most successful expansion is a knowledge of the relative only and not of the absolute, even in those same so-called exact sciences, those sciences

Washington Territory Coal.

The Tacoma Globe says: Although only now in its infancy, the mineral prospects of Washington Territory have begun to attract the attention of numerous capitalists, and men who consider that the most important mineral deposits had been discovered and had settled down with a goodly "pile," have emerged from their retirement to investigate the boundless resources of this hitherto unheard-of corner of the Republic. The liveliness of the real estate market will, without doubt, occupy the attention of a majority of investors for a considerable time to come yet; as the country fills up the attention of moneyed men will turn to other sources, and every indication goes to show that with the introduction of smelters and enlarged facilities for the output of coal, this Territory will rank among the first mining districts of the world. The reason Washington Territory differs so materially from other States and Territories is that mineral deposits are universal throughout its entire length and breadth. So far as the reports of the numerous prospectors which daily arrive in the city are concerned, indications of every kind of mineral, from the most precious metals to those more common, are found everywhere.

The value of coal as a fuel, its impurities excluded, depends upon its density, the amount of moisture present, and the amount of oxygen

man mines of King county, is composed of the following parts:

	Per cent.
Water.....	4.17
Fixed carbon.....	41.35
Gas.....	39.25
Ash.....	13.04
Sulphur.....	1.40
Total.....	100.00

Gas-Firing or Making Acid.

In concluding the series of articles on concentration of sulphuric acid, condensed from Mr. Adams' paper, we give a cut which he says shows the best practice which is admitted to be by direct firing over the tops of the pans. The adoption of gas-firing gives uniform heats without necessary waste, and reduces the wear and tear to a minimum.

Objections are raised to this type of plant, on the ground that a certain definite percentage of monohydrated acid is necessarily lost in the current of intensely heated and rapidly moving flame products and air thrown over the surface. This surely need not occur where, by gas-firing, the products of complete combustion are quietly and evenly held in proximity to the upper surface of the pane until saturation takes place. By this method of firing it will be seen that the outlets for the vapors can be controlled absolutely, up to any definite point of saturation.

Such regulation is not as difficult as it looks

Storage Batteries on Street Cars.

The Sacramento Record-Union says: Yesterday was a great day for Sacramento, as it saw the successful introduction of electricity as the motive-power for propelling street cars. Ever since a few enterprising and energetic business men entered upon the construction of a street railway on which electric cars were to be used, the cry has been heard on all sides that it never would be a success, and everything possible has been done by some people to belittle the efforts of the managers and throw cold water on the enterprise. Yesterday the officers and promoters of the scheme had their day of victory and received a perfect ovation from the populace as they passed through J street on their elegant car. It was the occasion of the trial trip of the first car, and it proved a success in every particular.

The car is propelled by two electric motors of four-horse power each, capable of working up to eight-horse power each for a short time. The motors are actuated by electricity stored in 80 cells of the Electric Accumulator Company's make (type "23"), which are carried under the seats of the car. These cells are run under the seats from the end of the car upon trays, and make the connection of the machinery of the car automatically.

The invited guests were assembled at the corner of Fourth and J streets, and had but a few moments to wait for the car, which started from the end of the line near the Southern Pacific passenger depot. As it came around the corner of Third street and turned into J, a great shout went up from the hundreds of people who were collected along the sidewalks on both sides of the latter thoroughfare. Stopping at the corner of Fourth, the favored individuals who had invitations were taken on board, and the car moved on up J street. The electrician, Mr. Wright, stood on the front platform with his hand on the little lever by which the car is started and stopped and its speed regulated. By his side stood L. L. Lewis, while Edwin K. Aleip occupied the rear platform. These gentlemen were repeatedly cheered as the car passed along, and the crowds of citizens were wildly enthusiastic over the evident success of the enterprise. Handkerchiefs waved from all the balconies and the street had a gala-day appearance. The people were happy, and those who predicted failure were dumb.

Those on the car were delighted. Stops and starts were made without the least jerk or jar, and the car ran with less noise than the ordinary horse-car. At the street crossings the electrician sounded the gong by simply pressing an electric button with his foot.

The car proceeded on its way, going down Eleventh to L and up L to Fifteenth, to M, to the corner of Twenty-eighth street. The late rains had put the streets in a terrible condition, and as no car had ever been run over the track, some difficulty was anticipated, but none was experienced.

The return trip was made without the slightest hitch. The car is not turned round in order to run back. The lever is simply removed from one platform to the other, the headlight changed to the other end, and the action reversed. Most of the trip was made at a low rate of speed, owing to the condition of the track, but coming down J street the car ran at the rate of 15 miles an hour, making a block in 20 seconds.

At 7:30 o'clock in the evening the car was brought out again and made four trips up and down J street as far as Eleventh, carrying the wives and families of the directors of the road. The appearance of the car at night was much more striking and attractive than in the daytime. It was brilliantly lighted with electricity, and the electric headlight seemed more powerful than that of a locomotive. The people on the streets were delighted and gave expression to their joy in frequent cheers. The rate of speed at night was greater than during the trial trip, and everything worked perfectly.

The Utah sulphur smelter is rebuilt at the mines, but the refining and subliming works will be built at Salt Lake when the present legal complications are terminated.

GERONIMO PAPINA, a miner employed at the Yuba mine, Pioche, Nevada, was killed on Wednesday last by falling from the bucket in the shaft.

SACRAMENTO has a street railroad on which the cars are moved by electricity in storage batteries. A successful trial was made this week.

U. S. SURVEYOR-GENERAL HAMMOND has appointed Charles H. Morgan a United States Deputy Mineral Surveyor for California.

OREGON people are talking of establishing a State Mining Bureau.

which constitute the fulcrum whereon rests the lever of modern progress. How many infidels can be counted on the roll of distinguished mathematicians? How many even among eminent metaphysicians, whose studies, while they relate directly to the subject at issue, afford them the widest latitude for speculation? Intellectuals successfully trained in those sciences generally search only after truth and know at least the nature of proof. Faithfully yours,
Austin, Nev., Sept. 26, 1888. DIOGER.

THICKNESS OF THE LICK LENS.—Prof. Burnham furnishes the following information concerning the lenses of the Lick telescope: The following are the radii of curves of the two lenses composing the 36-inch object-glass: R. (I), 259.52 inches; R. (II), 259.52 inches; R. (III), 239.59 inches; R. (IV), 40,000 inches. The distance between the two lenses, (surfaces II and III) is 6½ inches; surfaces III and IV, as you will see, are concave, the latter being practically a plane surface. The thickness of the crown (concave) lens in the center is about 1.7 inches, and of the other about three-fourths inch.

A \$20-PIECE.—In the U. S. assay office, N. Y., the gold used in the assay department for testing is absolutely pure, being 1000 fine, and is usually run into long, thin strips that look like so much tape or ribbon. "People often ask me," said a gentleman in this department, "how much gold there is in a \$20 gold piece. There is exactly \$20 in a \$20 gold piece, the alloy used being in excess of this valuation."

A PRACTICAL FIRM.—Wells, Fargo & Co. are making arrangements for establishing a dining-room for their employees on the top story of their new building on Mission street, with the object of keeping young men and boys in their service from the saloons, to which they are attracted by the free lunch.

present. For instance, the oxygen helps, and by the aid of hydrogen produces water and waste coal. Water being an incombustible material, it absorbs the heat produced by the ignition of the coal. If there is much ash it is liable that a slag will be formed, and the amount of heat used in sustaining the slag is also lost. Anthracite coal is the best fuel to produce a high heat, with semi-anthracite or steam coal ranking next. The latter produces a considerable flame and very little smoke, which makes it a superior article for the production of gas. The best kind of coke is made from bituminous coal, because of the large percentage of volatile hydrocarbons therein contained, which disperse easily when exposed to heat. The more oxygen the less carbon and combustible gases, and the more carbon contained in the coal the harder it is to ignite. All the above-named coals are found from the Cascades west to the Pacific. In order to show their superior quality, the following analysis made by Mr. Bethune is given of some semi-anthracite samples from the Conner claim, situated on Skagit river, which promises to be a very important mine:

	Per cent.
Moisture.....	3.73
Fixed carbon.....	71.12
Volatile combustible matter.....	20.67
Ash.....	4.36
Sulphur.....	.12
Total.....	100.00

In this county, and but 12 miles from Tacoma, is a bituminous coal-field which promises to be rich property. An analysis of some samples shows the following results:

	Per cent.
Water.....	3.62
Volatile gas.....	58.90
Fixed carbon.....	34.50
Ash.....	2.95
Sulphur.....	.02
Total.....	100.00

A sample of lignite or wood coal from the Gil-

at first glance, and it offers an absolute degree of heat at all points in the line of pan-surfaces, and at all times alike, without excess of air currents. A failure by reason of absence of practical skill in application should not condemn a process of so great promise.

The employment of superheated steam, favorably operated in many of the Continental factories, is practically an unknown process in this country. Under proper conditions, there is much to be said in its favor, and another decade may give us examples worthy of mention.

CALIFORNIA AND ALASKA.—Fred Searle, writing from Alaska to the Nevada Transcript, says that whatever may be claimed for the mineral wealth of Alaska, it certainly does not afford as good a field for the prospector as does California to-day. So far as can now be ascertained, large capital will be required to place the mines there on a paying basis; and the country is so densely wooded, so covered with undergrowth, so steep and rocky, that searching for mines on the mountains is almost impracticable. Most of the prospecting is done in the canyons and where the streams have exposed the ledges.

SLATE CREEK.—A correspondent writes us from Prescott, Arizona, that the mines on Slate creek are looking very well, but the miners are in great need of copper reduction works similar to those of the Argo, at Denver. There is plenty of good copper ore in the district, but at present they have to pay about \$34 per ton for shipping and treatment, so it takes good ore to pay expenses.

MINERS in the Bonanza mine, Tuolumne county, recently took out over \$5000 in one day from a pocket.

The Eureka Con. mine has sent 60 tons of lead to the Selby smelting works.

Passing Events.

The successful application of electrical power for quartz-milling on a large scale on the Comstock means a good deal for that section as well as for other mining regions. On the Comstock, however, it is specially important, for cheaper milling will admit of the crushing of classes of ores hitherto valueless. The system will, no doubt, be extended.

The sale of the San Bernardino tin property to English capitalists will doubtless be followed by systematic development of the mines. Litigation has for years prevented active work, but now that conflicting interests are settled, and the property is in the hands of capitalists, it will not take long to prove the value of the deposits.

The Southern Pacific Co. has commenced to haul here every week 60 or 70 carloads of coal from Wyoming. It costs \$3 a ton at Rock Springs, and the freight and handling add \$6.75 more. There is not much margin for profit left, and it seems too bad that this coal cannot be laid down here more cheaply, when we need cheap coal so much.

The rich strike on the North Star mine, Amador county, is the topic in local mining circles at present. An account of it is given in our mining summary in another column.

Thanksgiving day was generally celebrated here as a holiday, and the prevailing fine weather gave all an opportunity to enjoy it in the open air, if they so desired.

Gold Discoveries.

There is nothing that will so suddenly and quickly bring a country into notice and settle it up as the discovery of gold. No matter what its agricultural resources or fertility of soil, they will long lie neglected and useless and only be developed by slow degrees. But gold mines bring a population suddenly and quickly, and not only the mines but all the other resources are developed at a bound. We do not need to go out of the boundaries of this State to furnish a notable example. Not many weeks after gold was discovered in California, the eyes of the world and the steps of thousands were turned in this direction, and it was not many months after that a population had gathered which founded a State. It took some years, however, before the agricultural resources were recognized, and it is only to-day that they are being fully realized and developed. It was not until the decadence of the gold supply became apparent that men turned their thoughts to tilling the soil, and then they paid attention mainly to grain. Of late years, however, the capacity of soil and climate with regard to various products has been tested and proved.

The agricultural lands are slowly settled up, but let gold be found and large areas are appropriated in a day. It is true that the mineral lands are as quickly abandoned when worked out, while the agricultural lands are increased in value with time. The gold is exhausted and not reproduced, while the agricultural products are harvested yearly.

But as an incentive to rapid settlement of vacant lands or new regions, nothing can equal the discovery of gold. When Hargraves, going from California, and recognizing the same features, found the gold in Australia in 1851, he inaugurated the settlement of an immense country. Individual industry and commercial enterprise were encouraged, and an immigration started which resulted in founding the splendid colonies now existing. Without this incentive of gold, those vast areas would not have been settled in a hundred years, laboring as they did generally under the stigma attached to penal settlements. Emigrants were even assisted by the mother country to go to the colony. When gold was found, however, the people went there by thousands.

It has been found in other colonies also, and with about the same result. In a report to the Legislative Council appointed to consider the various claims for the discovery of gold in Victoria (published in March, 1854,) occurs the following paragraph:

"The discovery of the Victoria gold-fields has converted a remote dependency into a country of world-wide fame; it has attracted a population extraordinary in number with unprecedented rapidity; it has enhanced the value of property to an enormous extent; it has made this the richest country in the world; and in less than three years it has done for this colony the work of an age, and made its impulses felt in the most distant parts of the world."

Silicon.

We recently received several samples of silicon from a claim located not long since by Ohas. T. Washeim, near White Plains, Churchill county, Nev., and close to the railroad. There is an abundance of this material, which can be quarried at small expense, and all contained in a 20-acre claim. The material is in a regularly stratified ledge, running northeast and southwest. There are several distinct strata, each carrying material of a certain quality of fineness. The outer stratum westward is exceedingly fine; the next is coarser, and the next coarser still. There are other strata of greater degrees of coarseness.

The best is a chalky-looking piece fine enough to be useful in the manufacture of electro-silicon—silver polish. Another piece of the same material has about 70 per cent silicate and would be useful for soap manufacture or foundry sand for fine work. The finest is identically the same as was recently shipped to New York from Nevada, for the Electro-Silicon Company. The actual expense of laying this down in San Francisco would not exceed \$11 per ton for mining, loading and freight charges by carloads. More or less of this substance is found in different localities, but some of the samples sent us are quite fine in character.

Mineral Surveyors.

The requirements in other countries are very different from what they are here in the matter of qualifications of official mineral surveyors. Here the U. S. Deputy Mineral Surveyors are appointed by the Surveyors-General of the different States without any official examination unless they choose to make it. The only judge of their qualifications is the man who appoints them. Under the conditions existing in this country, little knowledge of mining matters is expected of them, and they pick that up as they go along, the main requirement being that they understand how to work with a transit and to work up their field notes. There is no board of examiners to find out whether a man is fully qualified in all the branches of his profession, and those who employ them must trust more to personal knowledge or reputation of the individual than to any general merit implied by the title of U. S. Deputy Mineral Surveyor. Some men who have held the appointment for a long time have acquired experience which is valuable to those who employ them, and are kept busy in consequence. Others have very little to do.

To show how careful they are in some other countries in conferring official authority on mining surveyors, we quote the "preliminary conditions" of the examination for mining surveyors in the Colony of Victoria:

Every candidate must have previously obtained a certificate as contract or authorized land surveyor from the board of examiners appointed in connection with the Department of Lands and Survey in Victoria.

He must also have served for not less than six months under some competent mining surveyor or engineer, or mining manager, in the conduct of mining surveys or actual mining operations.

A candidate whose application shall have been approved as having complied with the above conditions will be examined, and will be required to pass in each of the six following subjects:

(1) Mining Surveying.—Connection and reduction of bearings to datum of surface survey; survey of vertical and inclined shafts, drives, and workings; survey of mineral veins and lodes, leads and drifts.

(2) Leveling.—Practice of surface and underground leveling; leveling by vertical angles, plotting sections.

(3) Mensuration of Earthwork.

(4) Practical Mining.—Construction of shafts, chambers, and tunnels in rock and drift; timbering, drainage and ventilation of mines; general principles of the strength of timber in framings; construction in rough carpentry.

(5) Hydraulio Engineering.—Measurement and estimation of sources of water supply, dimensions, and discharge of pipes and channels; construction of reservoir embankments, weirs, and aqueducts.

(6) Lithological structure of the principal rock formations as they occur in Victoria, modes of occurrence of gold and other valuable minerals.

It will be seen by this that the mineral surveyors in the Colonies have different work expected of them from what is the case here. It is mainly surface surveying that our deputies have to perform, and a knowledge of surveying and of the general mining laws is all that is expected. It must be remembered that here the mines belong to the people who have located or purchased them, while abroad they belong to the Crown. This in itself would naturally make a difference in the duties of the official surveyors.

PAYING WELL.—The Broken Hill Proprietary Company of Australia is turning out an average of \$100,000 per week in coin. The company is paying a regular monthly dividend of \$15 per share; the present selling price of the shares of this company is \$1400. This is the company that Mr. Patton left the Comstock to take charge of.

AT MELBOURNE.—We sent about 500 copies of the MINING AND SCIENTIFIC PRESS to the great exhibition at Melbourne, and the resident manager of Parke & Lacey placed them with the mining machinery exhibit of that firm. He writes that the mining men there appreciate the paper, and regrets that more copies were not furnished, as they were in demand.

Something About Elevators.

NUMBER 5.

Now that elevators have become a positive necessity in all the well-regulated and properly equipped hotels, business blocks, factories, stores and other buildings of like importance, where the questions of rapid transit and convenience are of serious consideration and importance, it becomes the bounden duty of all persons owning and occupying such buildings to provide and apply to their elevators the simplest and most effective safety attachment they can find, in order to protect all persons who are obliged to use their elevators against all possibility of injury in case of accidents.

Such safety attachments, in order to be positive and reliable, should be constructed with as few working parts as possible and entirely free from springs, triggers, latches, pawls and unreliable parts requiring almost constant care and attention to prevent their becoming stiff and gummed up or otherwise deranged and consequently useless when most needed.

They should furthermore be entirely automatic in their action and arranged so as to operate instantaneously and effectively whenever the descent of the cage or platform is perceptibly increased beyond the usual speed either by reason of the breaking of the main cables, counterweight or drum ropes, ram-stem, winding drums, or any other accident which is likely to happen to the most perfect of machinery.

Every elevator-builder has a safety device of some kind that he applies to the cages which he builds, and as a matter of course unhesitatingly recommends it as the best and only reliable one in use. In order to prove these assertions a pretense is made at testing as soon as the elevator is finished and the "safety" is in order. These tests almost always consist in forming a large loop of slack cable tied with a piece of rope, and when the cage is raised to the next floor the hind rope is cut so as to allow the cage to drop suddenly. The new "safety" nearly always stops the cage. The purchaser believes that the "safety" is reliable and the builder receives his money and is happy.

These tests illustrate what would be the result in an accident caused by a broken cable, but as not one elevator accident out of 50 is caused by the breaking of a main cable, the reliability of tests of this kind is self-evident. Nearly all the safety attachments now in use upon elevators are based and built upon this principle and theory.

California ingenuity is again entitled to credit in discovering a safety device for elevators which is claimed to fill all the requirements of a first-class attachment, herein enumerated, and by several actual tests has proven itself to be a "safety" in fact as well as in name. We refer to the automatic safety clutch, patented by B. E. Henriksen, the architect, of 218 Post street.

As will be seen by the sketch on the opposite page, this safety clutch consists of two cams or eccentrics provided with sharp teeth on the outer surface, mounted on a steel shaft, journaled into a solid angle brace or bracket, securely bolted to the frame of the cage, and operated by means of an upright lever, surmounted by a rubber roller which is made to run over a series of bosses or projections applied to the guide-posts. Two sets of these clutches are attached to every cage. When the cage descends at the regular speed the rubber rollers pass over the projections without throwing out the levers.

Just as soon, however, as the speed of the descending cage is perceptibly increased, either by reason of the breaking of the cable—counterweight ropes, drums or any other part of the hoisting machinery, the impact of the rollers against the projections causes them to rebound, thereby throwing out the levers and bringing the cams or eccentrics in contact with the guide-posts and instantaneously stopping the falling cage. The principal features of this safety clutch consist in the simplicity and strength of its construction, as well as in its reliability and instantaneous action. When applied to a cage it is in full view of the operator, but does not require any attention. As there are no springs, triggers, pawls, governors or other unreliable mechanism to become broken, stiff, gummed up or otherwise deranged, it is ever ready for instant service.

Another very important feature possessed by this safety clutch is the possibility of applying it to any kind of cage, old or new, without in-

terfering with the safety already applied thereto, and in this manner making assurance doubly sure. This clutch being entirely automatic in its action and operated by the speed of the cage, its action is positive; the greater the speed the quicker the action; the heavier the load upon the cage the tighter the grip of the cams. It also sets itself automatically, and can be adjusted and regulated to any rate of speed, and will operate as readily on an empty as on a heavily-loaded cage.

The following record of actual tests shows that the Henriksen safety clutch has proven itself to be all that the inventor claims, and is worthy of consideration and attention: August 17, 1880.—Elevator in the Johnson building, 120 Sutter street; fall caused by the breaking of main drum; six passengers in the cage; nobody hurt. September 28, 1880.—Freight elevator in California Furniture Factory, No. 224 Bush street; elevator-man and load of costly furniture on platform; main pinion on main shaft broke; no damage of any kind. June 25, 1881.—Hass Bros., wholesale grocers, north-west corner Front and California; drum broke in basement; porter and load of freight on platform; no damage. August 15, 1881.—Sloan & Co., wholesale carpet store, No. 525 Market street; the manager and two ladies descending from top floor; the drum ropes broke; nobody injured. May 7, 1882.—Elevator in New City Hall, S. F.; two men and two ladies in the cage; main hoisting-wheel broke; no person injured. September 14, 1885.—Elevator in Mechanics' Pavilion on Larkin street; main driving-wheel of engine broke; 20 to 25 persons on the platform; nobody hurt. S.

THE skeleton of a miner named James Robinson was found this week in his cabin in Lincoln Gulch, Deer Lodge county, Montana. All the flesh had been eaten from the bones by mountain lions. It is supposed he took an overdose of opium, and while in an unconscious condition the wild animals entered his cabin and killed him.

THE Ohio petroleum-field is now yielding 40,000 barrels per day, nearly all of which is piped to Chicago and used as fuel. This is what shuts down the coal mines.

DR. W. T. JOHNSON of the State Mining Bureau has analyzed the pottery clay found in

The Debris Commission.

Major T. H. Hanbury having arrived from his station in Oregon, the Debris Commission held its first meeting on Monday in the office of Mayor Heuer, with Major W. H. H. Benyard

three members of the Commission has been divided so that now will go over the documents already received, and each of the others is to take half of what is to come. All of the members of the Commission are officers of the U. S. Engineer corps, familiar with the work of im-

HENRIKSEN'S SAFETY DEVICE FOR ELEVATORS.

as chairman. The headquarters are in the Flood building, corner of Fourth and Market streets. They have decided to hear every argument pro and con on the hydraulicking dispute. They will hear miners and farmers, and will gather all the testimony obtainable as to how

provement of rivers and harbors, and bring to their task much technical knowledge and experience in this direction. It is, however, regretted by many miners that some engineer familiar with hydraulic mining was not chosen to act as one of the Commission. Still the gen-

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING NOV. 20, 1888.

- 393,222.—SPRING CLASP—H. Elieau, S. F.
- 393,223.—CARTRIDGE EXTRACTOR—F. E. Elliot, Miles, W. T.
- 393,102.—REGISTER FOR WATER-METERS—F. T. Gilbert, Walla Walla, W. T.
- 393,234.—TWO-WHEELED VEHICLE—Wm. Holloway, Gilroy, Cal.
- 393,309.—STATION INDICATOR—B. W. Lyon, S. F.
- 393,116.—BALING PRESS—W. P. Martyn, Harrisburg, Ogn.
- 393,237.—STATION INDICATOR—J. I. Irving, S. F.
- 393,178.—FIREPLACE—R. Savage, S. F.
- 393,197.—PRUNING SHEARS—Woolley & Behmer, Santa Rosa, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TWO-WHEELED VEHICLE.—Wm. Holloway, Gilroy, No. 393,234. Dated Nov. 20, 1888. This is one of those vehicles known as carts, and the object of the improvement is to prevent the up-and-down motion due to the joggling of the horse. The rear section of the shaft and the spring are clipped solidly to the axle. The forward section of the shaft is hinged to the rear in a peculiar manner, and a spring is interposed at this connection in such a way that the joggling movement of the horse is not imparted to the vehicle.

FIREPLACE.—Richard Savage, S. F. No. 393,178. Dated Nov. 20, 1888. In this invention much of the heat which goes to waste in fireplaces of ordinary construction is economized by means of an air chamber at the rear through and around which the products of combustion are carried by suitable flues and the air thus heated is delivered into the room through ornamental apertures in the sides of the grate-frame. The back of the fireplace is formed with pins or lugs cast upon it so as to project rearwardly into the heating space to increase its efficiency. An opening is made in the back of the grate leading to the ash-pit, and suitable flues and dampers to cause a draft into the chimney, which prevents the dust from being blown into the room. The grate and basket are made in sections, so that they may be easily taken down for inspection. Flues may lead from the hot-air space to other rooms, with registers by which the admission of heat to these rooms is controlled. Great economy of fuel results from this construction.

STATION INDICATOR.—Benjamin W. Lyon, assignor to Pacific Indicator Co., S. F. No. 393,309. Dated Nov. 20, 1888. This is an improvement on a similar device patented by the same inventor June 26, 1888. In that patent he showed an indicating roller, a series of winding drums with an endless chain or band, a rack pinion and ratchet movement on cylinder, springs and lever, by which the indicator is moved forward at each station. In the present invention he uses a tripping lever and a fixed lug or obstruction upon the road-bed, in combination with a rotary disk, a screw driven from the car-wheel or axle and provided with convolute grooves, together with a lever which engages and operates the indicating mechanism, and a means whereby this lever is caused to engage with a screw so as to be operated thereby until the station is indicated, after which it is disengaged from the screw and returned to the first position to be again operated.

PRUNING SHEARS.—Wm. O. Woolley and Daniel Behmer, Santa Rosa, No. 393,197. Dated Nov. 20, 1888. This invention consists of a semi-circular independent cutting blade, with the central point pivoted to an extension of one of the handles, and the rear end having an anti-friction roller with the other handle, and in combination with this of a rest for the limb or part to be cut, bearing such a relation to the blade and its two fulcrums that when the jaws are closed a knee-lever action is produced, and the power increased toward the finish of the cut.

W. J. COYLE of the firm of Knight & Co. has sold his quarter interest in the foundry and machine shop at Sutter Creek, Amador county.

J. W. WILLIAMSON of Philadelphia is about to found a school for the industrial education of boys with an endowment of \$12,000,000.

FIG. 1 AND 2.—LOOKOUT MOUNTAIN RAILWAY IN PLAN AND PROFILE.

the mountains near Colton, and pronounces it of excellent quality.

THE volume of water discharged on the Pelton wheels on the Sutro tunnel level is equal to about 200 miner's inches. The electric motors of the test run made 850 revolutions a minute.

THE strike of coal miners in Belgium is spreading. Gendarmes and guards are patrolling the troubled districts.

A \$70,000 cleanup has just been made at the Cherokee mine, in Butte county.

the debris has affected the navigation of the rivers and the bay.

The Commission will send out circulars to all of the leading representatives of the mining element and the anti-debris dwellers in the valleys, and also to the steamboat men and others. Written replies will be requested on all sides, and, if thought best, some oral testimony will be taken. As a report will be made to Congress at its next session, if possible, in time for it to take action, the time in which to receive replies will be limited to 60 days.

The preparatory work to be done by the

tlemen selected, having nothing to do with any business connected with either side of the dispute, will be apt to deal with the question in a manner that will cause their decision to be accepted as beyond criticism.

MECHANICAL PROGRESS.

Slow Progress of Electric Lighting in England.

The Boston *Journal of Commerce* refers as follows to some discussions at a late meeting of one of the English technical societies:

Prof. Farley of London, who has recently made two visits to the United States to inspect the various systems of electric lighting, presented the results of his observations. What astonished him when he reached the United States was the appearance of the electric light everywhere; what mortified him when he returned to England was to see it nowhere—darkness and gloom in the streets of English cities and towns; light in every city and village in the United States, where, according to recent statistics, there were 300,000 arc lights in use, and nearly 3,000,000 incandescent lamps. He thought that the slow progress in electric lighting in England was due to the Act of Parliament passed in 1882, which did not put electric lighting on the same footing as gas illumination. His attributions to this progress in the United States to the go-ahead-iveness of the Americans and to the great advancement which had been made in the United States recently in technical science. In that the Americans had gone ahead of the British. It was not, he thought, from any want of capacity on the part of English inventors that England was so far behind the United States in electric lighting. He claimed that England had produced the best dynamos and the best lamps, yet, with inferior machines, the people of the United States had left England far behind. The Americans were determined to go ahead, to use what came to hand till something better turned up, while John Bull waited to get the best before doing anything. In the United States, men of capital took hold of things and aided in their development, while in England they waited for the inventor to make his invention perfect.

There was a *non-sequitur* in the professor's argument. If England has produced the best dynamo and the best lamp, is it not remarkable that the Yankee does not appropriate them, if he is so eager to get the best? If England has produced the best means for lighting her cities, is it not still more to be wondered at that she sits still and does nothing?

Prof. Prece, the president of the section, said that the inaction of England was not due, in his opinion, to the Act of Parliament, for between 50 and 60 provisional orders had been taken, and under that Act, but it was because the system of electric lighting was not sufficiently advanced to warrant, in the minds of capitalists, the expenditures of money. He, too, like Prof. Farley, had just returned from America, and he had been greatly impressed by the wonderful activity of the people of that country; but he thought it wise on the part of England to wait until electric lighting was better understood, and when the best system was developed, to adopt it. They would know more a year or two hence than they do now.

Another paper was read upon the American system of electric lights as used on the Suez canal, by which vessels could navigate the canal by night, greatly increasing its efficiency.

It was plain, writes the foreign correspondent of a contemporary, from the general admission of all the speakers, that the United States is far ahead of the mother country in electrical apparatus. It is apparent, also, that none of the speakers has comprehended all the factors entering into the question. They must go beyond this Act of Parliament for the establishment of electric lighting companies; nor will the reason given by Prof. Prece suffice—that the Americans are ahead in technical education. I apprehend that the patent laws of the two countries have had something to do with it. In the United States the laws are so democratic, the patent fees so low, that everybody is contriving something new. Invention has become second nature. Some of our greatest men—those who have made their mark on the age—have thought upon the great question of applied mechanical science. Thomas Jefferson took out a patent for a plow; Abraham Lincoln patented an invention for the improvement of canal-boats—a method for getting them over shallow places in rivers. The universality of invention in the United States has come from the needs of a new country—the demand for prime motors, the fingers of steel and hands of iron, to do the work of human muscles. The great inventions of the last half-century have come largely from the United States. At the close of the last century and the beginning of the present, under the stimulus of the inventions of Watt and Arkwright, impelled by the demands of the textile industries, England made a rapid advancement in the construction of labor-saving machinery. Her advance was in machines for manipulation of metals and textiles. In the third decade the United States stepped to the front with the telegraph, and later its application to the fire alarm, and in these later years she has astonished the world by the telephone, phonograph, graphophone, the electric railway and the electric light, first exhibited in Salem, Mass., by Prof. Palmer. The United States has not set the rivers on fire, but she is compelling her mountain streams, instead of idling their time away, to give light and comfort to the people, illuminating street and dwelling, by turning water-wheels, which set dynamos to whirling, creating light, not out of falling water, but by it.

WROUGHT IRON DIRECT FROM THE ORE.—In a German invention the furnace is provided with hollow walls, through which the blast is led before entering the tuyeres, for the purpose of regulating the temperature both of the furnace and the blast. At the same time the hearth is also made immovable. The walls of the hearth are furnished with tuyeres, each of which forms a portion of a hollow sphere, and rests in a spherical bearing in the walls of the hearth, to admit of directing the tuyeres in any required direction. The iron ore is mixed with suitable fluxes and a small quantity of coals, as usual in the production of pig iron, and reduced somewhat above the tuyeres, while the furnace is caused to work cold. The iron thus obtained sinks past the tuyeres without taking up any large amount of carbon, and upon arriving at the hearth it forms a wrought-iron bloom, which may be immediately worked.—*Ex.* In connection with the above, we would say, on authority of the *Pittsburg Post*, that John Norton and John Tate, employees at McKeesport, Pa., have, after much outlay both of money and labor, discovered and thoroughly tested, on a small scale, a process whereby the finest quality of wrought iron is produced direct from the ore, and with very little additional expense, entirely obviating the slow and expensive puddling process now in use. The process has been duly patented, and promises to attract national notice. Numerous offers for the patent have been received by the men.

MAKING STEEL TUBES FROM SOLID RODS.—At a recent meeting of the Physical Society, Berlin, the president, Prof. Da Bois Raymond, gave an account of a communication which had been made by Siemens at the last meeting of the Akademie der Wissenschaft. A steel tube 10 cm. long, with perfectly smooth external and internal surfaces and extremely uniform bore, and whose walls are apparently or perfectly equal thickness at all points, was prepared by the following method, patented by Manns-mann in Bismarck: Two rollers, slightly conical toward their lower ends, are made to rotate in the same direction near each other; a red-hot cylinder of steel is then brought between these cylinders and is at once seized by the rotating cones and is driven upward. But the mass of steel does not emerge at the top as a solid, but in the form of the hollow steel tube which Siemens laid before the meeting. Prof. Neesen gave the following explanation of this striking result: Owing to the properties of the glowing steel, the rotating rollers seize upon only the outer layer of the steel cylinder and force this upward, while at the same time the central parts of the cylinder remain behind. The result is thus exactly the same as is observed in the process of making glass tubes out of glass rods.

CORES IN HEAVY CASTINGS.—When cores run through heavy bodies of iron, the hot liquid raises the fusible element of the sand to such a high temperature that the grains fuse together, so that when the casting cleaner tries to get the core out he finds it almost as hard as the iron. A good thing to prevent this fusing of the sand is to mix some sea-coal or blacking in it, and to give the surface of the cores a good body of black lead, or plumbago blacking. This outside coat of blacking will prevent the liquid iron from eating into the surfaces of the cores and, and the sea coal or blacking mixed in the sand burns away and passes off in the form of gas, leaving a porous body between the grains of sand, which assists in preventing its fusing. In putting rods in such cores as are subjected to high temperature, it is a good plan to coat them with two or three thick coats of flour paste, and dry them in an oven as it is put on; for by doing this the dried paste burns off from the rod and leaves it free to come out of the casting.—*Molders' Journal.*

RIVETING STOVEPIPE.—A recent invention is a machine for riveting stovepipe. In the old way, each of the six or nine rivets in a piece of pipe was drawn and driven separately. By the use of this riveting machine, says the *Chicago Journal of Commerce*, all the rivets are drawn by one drop of the hammer, and all of them are set by one drop of the hammer. One man with this machine can turn out from 600 to 1000 joints of pipe per day. The pipe is formed on a cylinder connected with the riveting machine, and this makes it uniform in size and leaves the lap smooth and free from buckles. There is, we believe, no machine of this description in the market, and it is said the invention will mark a new era in the manufacture of stovepipe. It is easily operated, there is no complicated machinery about it, and it does the work perfectly.

HONOR YOUR WORK.—A workman who honors his work is pretty sure to have his work honor him. The man who is constantly striving to excel, whose aim is to perform every task in a superior manner and to make his services of the greatest value possible to his employer, is bound to succeed. This is the class of men all employers are glad to secure. But the class of hands whose only object on entering a shop is to while away time, no matter how, till the whistle blows, are always discontented and the most annoying of fault finders.

IRON FROM ALABAMA.—The steamer *City of Birmingham* recently arrived at Philadelphia with 2000 tons of pig iron, a direct shipment from Birmingham, Ala. This steamer, together with another, now building, is designed especially for this trade.

SCIENTIFIC PROGRESS.

The Petrified Forest of Arizona.

One of the wonders of Arizona is the silicified forest in Apache county in that Territory. This immense forest of petrified trees is regarded as among the most notable curiosities of the world. Petrified wood is quite common in almost all parts of the globe, but nowhere in such immense quantity as in the locality named. This wood is now being worked up into various forms, and sawed and polished by special machinery, for use in decorative art.

The Origin of these Petrifications.

One of the best theories of the origin of these petrifications was recently given in the *Popular Science Monthly*, substantially as follows: The trees were first overthrown and covered with volcanic ashes and tufa. The heated silicified waters, either gushing from natural hot springs, or forced up by the violent volcanic action which felled the trees, percolated through the ashes, cooled on reaching the level of the trees, and thus produced conditions favorable for rapid silicification or petrification.

The moisture in the ashes and tufa may have effected a partial alteration, as also any waters that may have filtered through them, either hot or cold. Under these circumstances decomposition would be assisted and much silica set free. The waters would become charged with this, the silica being held partly in solution, similar to that in liquid glass, the silicate of soda of commerce. The silicious water then slowly penetrated the wood buried in the tufa, and was slowly deposited in the cells of the wood. In this manner the fibers of the wood were replaced by the silica.

The process was evidently a slow one, and the trees, from all appearances, were partly decayed and water-logged when the silicification took place. The jasper and agates generally replaced the cell walls and fibers, and the transparent quartz filled the cells and interstices, especially where the structure was broken down by decay. The cell centers and cavities produced the conditions favorable not only for the deposition of the silica as quartz, but also for the formation of the druse, crystalline cavities of quartz and amethyst that enhance the beauty of the material so much. It is evident, from the rich variety of colors, that the waters held oxides of iron, and perhaps manganese, as well as silica, the red color being caused by hematite, the yellows and browns by limonite, and the black by oxides of manganese.

Mr. Kunz thinks that it is possible also that the ash was deposited partly in water, and thus heated it. There is every indication that the deposit is of considerable depth. Over the entire area the trees lie scattered in all conceivable positions, and in fragments of all sizes, sometimes resembling a pile of cartwheels. A tree 150 feet in length is often found broken up into as many sections of almost uniform length, presenting the appearance of having been sawed asunder for shingle blocks by some prehistoric forester.

Again is found a giant tree broken into countless fragments, ranging in size from a small pebble to a fair-sized houlder. Perfect shaped cubes, ready to be polished and used as paper weights, are also found. These multiplied fractures are the result of alternate heat and cold acting on the water collected in the fissures of the tree.

The highest point in the park is some 200 feet above the surrounding level, and it is here that the buried trees can be seen to the best advantage. Some of them are 150 feet long and 10 inches in diameter, and lie exposed in all conceivable positions. One section of a tree, which has been broken up, measures 8 feet in diameter, 10 feet in length, and weighs several tons. The tree was originally about 200 feet long. Some pieces of the trunks of these trees, which were taken to New York, ranged from 8 inches to 13 feet in diameter, and from 25 to 1000 pounds in weight. The perfect preservation of the trunk is remarkable. The rings are so distinctly visible as to convince even the most incredulous of their organic origin.

Although silicified wood is found in many localities throughout the world, nowhere is it so beautifully colored as at this place. Here are found various shades of yellow, brown and green. Sometimes the colors appear in distinct spots, forming a mottled appearance; then, again, all blend so imperceptibly as to make a much more pleasing and harmonious effect than the decided banding of the agate, where the lines of demarcation between the colors are so distinct as to become obtrusive. The colors above mentioned are often relieved by white, black and gray, and by transparent spaces of brilliant quartz crystals, or, as sometimes occurs, of amethyst. Broken sections of the hollow trunks are often lined with amethyst, quartz and calcite, which add to the variety of color.

Dr. P. H. Dindley of New York microscopically examined some sections of this wood, and finds that part of it at least belongs to the genus *Aracaria*. He says that the *Aracaria excelsa*, the Norfolk island pine of the South Pacific ocean, grows to a height of from 150 to 200 feet. In longitudinal section the lenticular markings of the wood cells near each end are in double rows and contiguous, the markings of one row alternating with those of another, giving the appearance of the beautiful hexagonal markings of this genus. In central portions of the cells

sometimes only one row of markings is seen. Medullary rays were indistinct.

Other portions resembled our red cedar (*Juniperus Virginianus*) when grown in the extreme South. This cell structure of some indicates a growth in a mild and uniform climate, the annual rings being marked only by one, two, three or more slightly smaller hexagonal or rounded cells, not tabular, as is usually the case. The cell walls are nearly uniform in thickness. All the specimens examined showed that the wood originally was undergoing decay before being filled with the various media which afterward solidified. On some of the specimens traces of fungi (*Mycelium*) causing decay were discovered. The beauty of the wood is due to the destructive influences of fungi.

LIQUID CARBONIC ACID.—The manufacture of liquid carbonic acid is now an important industry in Berlin, where, according to *Industries*, a company established for this purpose is making daily over half a ton of this commodity. The acid is sent out in steel bottles, each containing from 17 to 18 pounds, and the price charged is a little under 1s. per pound. The acid contained in a bottle when expanded into gas occupies over 10,000 cubic feet. It is principally used in the manufacture of mineral waters and for beer engines. An important use of carbonic acid was suggested as early as 1879, by Dr. Raydt of Hanover for the raising of wrecks, who demonstrated the possibility of this application by an experiment at Kiel. The apparatus consisted of a steel bottle containing the liquid acid, and a collapsed canvas bag placed over the neck of the bottle. When the whole is submerged, and attached to the object to be raised, a cock is opened, and the liquid in the bottle is allowed to expand into the bag, inflating the latter, and thus causing it to rise. Another application was introduced by Herr Krupp of Essen for compressing liquid steel, and a large plant for the production of liquid carbonic acid has already been at work for some time at this Essen factory.

ELECTRICAL GLASS-BREAKER.—Several glass factories at Pittsburgh are now using electricity for a novel purpose. Heretofore, when it was desired to cut out one of the large cylinders of window glass, a simple but primitive method was used. This consisted of the pulling out from the furnace of a thin shred of glass heated white. This was quickly wrapped round the bottle-shaped end of the cylinder, and it burned through or fractured the glass. A pair of tongs had to be used in this process. By the new method, the glass cylinder is encircled with a fine wire, the extremities of which are put in connection with a small electric battery. It is necessary that the wire adhere closely to the glass. When a current of electricity is passed through the wire, the latter becomes red hot and heats the glass beneath it. Then a single drop of water deposited on the heated place will cause a clean breakage of the glass clear round the path of the wire. Contrary to what takes place with the usual process in the treatment of this fragile material, it is found that the thicker the glass may be, the better the cut.

SENSE OF SMELL IN DOGS.—Careful experiments on the sense of smell in dogs have been made by Geo. J. Romanes, who has communicated the results to the Linnean Society of London. He finds that not only the feet but the whole body of a man exhales a peculiar or individual odor, which a dog can recognize as that of his master amid a crowd of other persons; that the individual quality of this odor can be recognized at great distances to windward, or in calm weather at great distances in any direction; and that even powerful perfumes may not overcome this odor. Yet a single sheet of brown paper, when stepped upon instead of the ground, and afterward removed, was sufficient to prevent Mr. Romanes' dog from following his trail.

THE EARTH'S CLOUD-BELTS.—The researches of M. Teisserenc de Bort show a marked tendency of the earth's cloudiness throughout the year to arrange itself in zones parallel to the equator. A belt of maximum cloudiness may be traced near the equator, two bands of light cloudiness extending from 15 to 35 degrees of latitude north and south, and two zones of greater cloudiness between 45 and 60 degrees, beyond which the sky seems to become clearer toward the poles. These zones have a noticeable tendency to follow the sun in its change of declination, moving northward in spring and southward in fall. The zones of clear sky correspond with regions of high pressure. The distribution of cloudiness is a direct consequence of the course of the wind.

A NEW ALLOY.—A new alloy has been discovered by Herr Reith of Bockenheim, which is said to practically resist the attack of most acid and alkaline solutions. Its composition is as follows: Copper, 15 parts; tin, 2.34 parts; lead, 1.82 parts; antimony, 1 part. This alloy is, therefore, a bronze with the addition of lead and antimony. The inventor claims that it can be very advantageously used in the laboratory to replace vessels or fittings of ebomite, vulcanite, or porcelain.

ENGLISH APPRECIATION.—Sir Wm. Thompson considers Edison's discovery of the phonograph "one of the greatest in the practical application of science ever made."

USEFUL INFORMATION.

Stings of Bees - Why Bees and Wasps Sting.

Nearly every boy and girl, whether living in the country or city, has at some time been stung by either a bee or a wasp. At the time of the sting the pain has so occupied the attention that you did not stop to consider whether the sting was inflicted by a bee or a wasp, nor did you at the time admire the mechanism by which the sting was inflicted. All are aware that the sting is actually painful, and that it is inflicted by the rear or tail end of the insect. Some one has humorously called this the "business-end" of the insect. All should know that a drop of water of ammonia (often called "spirits of hartshorn") applied to the place will usually at once relieve the pain caused by these stings, as well as those of the mosquito. If ammonia is not at hand, a little baking soda, mixed into a thick paste with water, may be applied. In the absence of both of these, apply a plaster of mud. If no application can be made, the pain will soon pass away, and we may then well consider how the wound was inflicted.

Their weapons often serve to protect them from their enemies, but with bees, especially the honey, or hive bees, at the approach of winter, the drones or males are no longer of any use, and are killed off by the stings of the workers to save the stores of honey they would otherwise consume. With many of the wasps their stings are food preservers. The large wasps which make their holes in the ground, and some bees, like the carpenter bees, which cut circular holes in boards or other wood, deposit an egg in one of these holes, place food for the grub that will hatch from this egg to feed upon, and when this grub has made its growth, it goes into the chrysalis state, and in time comes out a perfect bee, or wasp, as it may be. But you will ask, "What has this to do with the sting?" A great deal. If the caterpillar or other insect, intended as food for the young bee or wasp, were dead when stored away, it would decay and be useless. The effect of the poison of the sting is to keep in a semi-torpid existence, alive, but still dormant, and thus preserve the food in a proper condition to be eaten by the grub of the bee or wasp. In this respect we can see that the sting plays a very useful part, but when the sting is employed upon ourselves we fail to see what good end is accomplished. Even when a bee-keeper is doing his best for the comfort and welfare of his bees, they often turn upon and sting him, most needlessly and painfully.—*American Agriculturist.*

ROMPING SWALLOWS.—There are sprightly birds that sometimes seem to have a really good and jolly time. An incident of this kind is referred to as follows in a late number of the *Buffalo Express*: They say man is the only animal that can laugh, but he is far from being the only one that can cut capers and have a good time. There is a colony of swallows that find a roomy home inside a broken cornice on the Noye building, at Washington-street bridge, that was lately observed engaged in what must have been sport. One of them, when first noticed, had a piece of paper about a foot square in his month. He flew with it over the bridge, and when in the air, dropped it. He at once flew under it and caught it, but let it go again and flew aside, when several others tried in turn to catch it. Some succeeded and some failed, and they kept at it till the paper had fluttered down uncomfortably close to the ground. Then they all flew up together and roosted on a telegraph wire to talk it over, their notes being very hilarious and quite different from a swallow's ordinary twitter. An observer, who goes to ball games sometimes, wondered if they were not canvassing the skill each displayed during his inning.

BAKERS' PROFITS.—A baker will toss a barrel of flour into a trough. Then he tosses 104 pounds of water on top of it. A quantity of yeast is added, and then the jolly baker has 300 pounds of dough to operate on. The 300 pounds cost him \$5. In short order the dough is turned into "twists," high loaves, pan loaves and other styles of the same quality. The oven's heat reduces the 300 pounds of dough to 260 pounds of bread. The baker sells his bread at the rate of four cents a pound, or at an advance of over 30 per cent over what it cost him. There are many bakers in this city who make 1000 loaves of bread per day, and sell it for from \$80 to \$150, or at a net profit of \$40. Little money is lost in the business, and most bakers do a cash trade. It is very seldom that bakers fail. The business is steady, reliable, and attended by very few risks, unless incompetent workmen.—*Herald of Trade.*

HORN-BORING INSECTS.—A correspondent of a contemporary writes: I have two powder-horns that have been hanging in a cupboard for some time. On looking them over recently, I find that there are several holes eaten or bored through them. The holes are about one-eighth inch in diameter, and look like the work of the apple-tree borer, but no insect was visible. Can you explain what made the holes? (Answer: Prof. Howard of the Department of Agriculture, Washington, says that objects made of horn are not infrequently subject to the attacks of insects of various orders, and notably of

Coleoptera of the families Dermestidae and Ptilinidae. The latter family (i. e., those species which have been observed to bore in horn) are too small for the size of the holes mentioned, but this size agrees very well with the holes made by species of the genus *Dermestes*, and among the various species of this genus, *D. valpinus* is most likely to have done the mischief. An accurate determination of the species in question is not possible, however, without seeing the specimens themselves. Frequent handling of objects made of horn, on exposing them to sunlight, will effectually protect them.

A NEW SCHEME.—A man recently presented a check at the baggage room in Danbury, Conn., and received in exchange a neatly painted box about the size of an ordinary trunk. A dozen expressmen at once desired his patronage. He smiled kindly, took out two long and two short sticks. The long sticks he fitted into staples at the upper and lower opposite corners of the box. The short sticks then became cross-pieces connecting the long ones, and the wheel found a place between the lower ends of the long pieces. Thus, quicker than it takes to tell it, the man had transformed his box into a wheelbarrow, and trundled it away. He returned in a few hours, repacked the wheel and sticks, and quit town on a west-bound train. He was said to be an agent for a religious publication house and resorted to the wheelbarrow device to save cartage money.

HOME-MADE ICE.—Take a cylindrical earthen vessel and pour 3½ ounces of commercial sulphuric acid and 1½ ounces of water into it and then add one ounce of powdered sulphate of soda. In the center of this mixture, place a smaller vessel containing the water to be frozen; then cover the vessel, and, if possible, revolve the whole with a gentle motion. In a few minutes the water in the small vessel will be converted into ice. The same mixture can be used a second or third time for making a block of ice. The operation should, if possible, be performed in a cool place—in a cellar, for example.

TO CLEAN OIL PAINTINGS.—The following recipe will be found valuable for the purpose: Mix well together two ounces of wood naphtha, one ounce spirits of salts, and a quarter of a pint of linseed oil. Before being used, the bottle containing them should be shaken. The application is simply with a soft pad of linen, to which should be given a circular motion. When nearly dry, give a second dressing, when the picture will come out in all its details.

RESTORING MOLDED PICTURE FRAMES.—Should any portion of the molding be destroyed, it may be restored by a composition made by boiling together some Venice turpentine, resin and linseed oil, then adding glue dissolved in water, and, finally, whitening, till the mass is brought to the consistency of putty. The composition is then shaped to supply the defective part, and is to be colored or gilded to match the rest of frame.

DYING OUT.—Two races of men are dying out—the Lapslanders, who number 30,000, and the Maoris of New Zealand, reduced from 100,000 to 45,000 since the days of Captain Cook, and likely to be extinct by the year 2000.

GOOD HEALTH.

Sweating It Out.

EDITORS PRESS:—I have read in the PRESS of Nov. 10th how a man cured himself of rheumatism—he "sweat it out." Of course I have known for a long time that all forms of rheumatism, including neuralgia, gout, etc., could be cured by the sweating process; but the man failed to say anything about the people who could not endure five such baths as he took. A strong, vigorous man might come out all right, but what about the weak ones who faint in a hot-water bath? If they should get "short of breath" in such an exhaustive bath, they might remain so.

To the weak ones who have rheumatism I would suggest the hot-air or Turkish bath, which have the same effect ("sweat it out") and leave the system vigorous and healthy.

I use what is called a blanket bath or pack, and for "chills and fever," ague, malarial fever, etc., they are a sure cure. I will give the fortune I expect to get from the next Havana lottery drawing for every case my blanket bath will not cure—I mean a positive, permanent cure. There is no use in being troubled with any form of rheumatism, or dreading any kind of fever or chills, in fact, almost any acute disease, if we understand and practiced "sweating it out." The important part of the process to learn is the how.

MRS. E. J. SQUIRES.
Redwood City, Cal., Nov. 21, 1888.

DIPHTHERIA CARRIED BY TURKEYS.—The following case is taken from the *British Medical Journal*: A fowl with diphtheria was brought to the house of a veterinary surgeon on April 24th and died on the 29th. The feeding and nursing of the bird devolved on a lad, aged 14 years, who was assisted by his brother, aged 5 years. On the evening of May 11th the writer was called to see the little boy of five, who had been poorly for a day or two. He had enlarged cervical glands on the left side, which had come on rapidly. He was a delicate little fellow, with fair hair and anemic aspect. The tem-

perature was 103° F.; pulse between 120 and 130. The fauces were more or less covered with diphtheritic membrane, the left tonsil more especially. Under the administration of the biiodide of mercury and iron, the throat symptoms cleared up and the child made a good recovery. On the day after this case was first seen, the boy who fed the fowl was very feverish, and had similar patches over his fauces, but not to the same extent as his brother. His throat was painted with bioglyceride. A sister, aged 9 years, had also a similar explosion on the fauces. Birk and acid and bioglyceride was the treatment. On the 18th the mother, who had nursed them, was attacked, and was similarly treated. They were all kept well up with beef-tea and stimulants.

THE BEGINNINGS OF INSANITY are more often overlooked or neglected than properly treated. This is the greatest cause that exists for the constant increase in the number of lunatics in every civilized nation. The fact that the patient seldom or never recognizes the danger to his mental health which is approaching, is one powerful reason for this neglect. Whenever there is persistent sleeplessness, a change in the sentiments toward those who should be nearest and dearest, and the development of ideas of an extraordinary or fanciful kind in a mind previously reasonable and well balanced, it is time that all sources of worry or any kind of mental strain should be removed as far as possible; that changes of scene should be had; and that every function of the body should be carefully examined into by a competent physician. This should be done at the very outset, otherwise suicide, homicide, or an offense against public morals may tell the friends and family altogether too plainly that the calling of a doctor has been deferred too long. There are many surgical affections which exemplify the warning this article is intended to convey. Of these, cancers and sarcomas afford the best examples. When small, and before they have infiltrated the surrounding tissues or sent colonies into distant organs, if removed by the surgeon's knife, they may or may not return. The chances vary a good deal, according to the variety of malignant growth which is under observation and its locality. But removal, and that at as early a date as possible after discovery, offers the best chance for life and freedom from suffering.

FLESH WORMS OR BLACK HEADS.—These are no worms and have no heads. To understand what they are, remember that there are sebaceous glands for the supply of oil for the surface of the skin, and that there are tubes leading from them to the skin. It is quite possible for the openings to become closed by dust and dirt (the blackness), the constant supply of the oil enlarging these, making them look like worms. Those who eat an unusual amount of greasy food are more liable than others to have them, or those having a sallow complexion, a dingy appearance, indicating a deranged state of the liver. Do not squeeze them, but apply a warm, wet cloth, so softening them that they will discharge, at least, by a gentle pressure. I recommend regular bathing weekly, using warm water with ammonia or castile soap, with the frequent use of the flesh brush. A very plain style of living, using no pork, will be favorable to cure.—*Brattleboro Household.*

FOR PAINS IN THE EAR.—According to the *Canada Medical Record*, Pavesi recommends a liniment composed of camphorated chloral, 2½ parts, pure glycerine, 1½ parts, oil of sweet almonds, 10 parts. This is to be well mixed, and preserved in a well-stoppered bottle. A pledget of very soft cotton is to be soaked in the liniment, and then introduced as far as possible into the affected ear, two applications being made daily. Frictions may be made each day with the preparation behind the ear. It is said that the pain is almost immediately relieved, and even in many cases the inflammation is subdued.

A SPEEDY CURE OF WHOOPING COUGH.—Mohr, a Norwegian physician, is reported to have been able to cure whooping-cough by means of inhalations of sulphurous anhydride. In the first instance this was done accidentally while disinfecting some rooms; subsequently it was done by burning six drachms of sulphur per cubic meter of space, the bedding, etc., being well exposed to its influence. After the room had been closed for four hours, ventilation was restored and the children put to sleep in the beds impregnated with the sulphurous vapors. In the morning the cough had ceased.

PNEUMONIA AND MICROBES.—It is generally supposed that pneumonia is due to the accidental penetration of specific microbes into the system, but the observations of M. Jaccoud, a French student of the subject, show that the disease really results from the development, under favorable conditions, of microbic germs permanently present in the system. A chief condition of such development is a sudden chill, which explains the frequent coincidence of lung affections with abrupt changes of temperature.

MANY will be glad to know that ground coffee digested in codliver oil quite overcomes the fishy taste of the latter.

A DISCUSSION of the Malthusian theory elicited the statement that clergymen, as a rule, have the largest families.

Curious Minera's of Utah.

Included in the mineral resources of Utah, apart from its precious metals, are deposits of alum, some recently discovered veins which are 18 inches thick and several hundred feet in length, of dazzling whiteness and great purity. Beds of nitre are also found sufficiently pure to readily fuse when thrown on hot coals.

Ozokorite or natural mineral wax, a rarity elsewhere, is here found in large quantities. It is air, acid and water proof, and can be used for imparting these qualities to other substances. As an insulator it is said to be perfect, and would doubtless be found a superior insulating material for electrical appliances. It could also be adapted as the base of a cheap, yet desirable, paving material, and for indurating piles and posts to prevent decay.

A somewhat similar discovery is gilsonite, found, on analysis, to contain about 80 per cent of carbon or asphalt in pure form.

Of the latter a vein has been discovered three feet wide and over a mile in length—a supply that, if worked, would be found almost inexhaustible.

As is now well known, the great Salt Lake is an immense, limitless magazine of salt, that can be readily obtained in any desired quantity by the simple process of evaporation.

From this lake vast quantities of sulphate of soda are also secured, blown on shore at certain temperatures by the winds, where hundreds of tons are often piled up in a single night, that can be utilized in the cheap production of sal soda and carbonate of soda.

MANAGEMENT.—A few days ago a prominent mining man of long experience in mines and mining business said to a representative of the *San Miguel (Col.) Journal*: "Most new mining companies make good assay showings of their ore, of ores of adjoining or neighboring mines. They are not worth the labor making them. I would rather have a good, reliable assay of the men who are at the head of the enterprise. That is all there is in a mine. When a company starts to develop a mine it never knows how much it is going to cost until they get through. Three of us may go to it. The other two may be ready to put up the full share of the money to strike the bonanza. I may get tired. They do not wait to develop my property for my benefit, and they become tired and quit. The mine lies idle for some time, and finally they sell out for little or nothing to get rid of it. The purchasers must have my third, and I get all I put in it, or maybe more. Then another company starts out, and it winds up the same way. Finally a successor strikes it rich, and the stock becomes very valuable, but it is only after successive companies have been organized and gone to pieces. The presumption is that all of these mines will be good, if the persons at the head of them will only stick together, but there is the rub, and that is why an assay of the men is of more moment than of ore. I could have bought Granite Mountain at one time at 18 cents, but at that time it was by no means certain that the company would hold together until it struck the vein. When it did strike it a dollar was cheap, because it was demonstrated that they had something to make them stick together."

LEASING.—A great part of the activity in mining matters during the past two years in and around Leadville, is directly traceable to the tribute system. In a number of cases, surface ground had either been badly worked or altogether neglected by company owners, and certain miners, cognizant of the facts, began to lease. Of course, the expense of surface workings was comparatively small and the profits, even at high rates of royalty, were good. This produced a sort of leasing craze, and parties with a little money and less experience in mining began to lease indiscriminately, and agreed to pay any royalty, supposing that the sure road to profits in mining was through the leasing system. The result of this was a large number of unprofitable leases, while the companies got their property developed more cheaply than they could have done it themselves. Then there was another class of properties that contained large bodies of ore which it was not profitable years ago to mine or treat. With improved facilities and reduced cost of smelting, however, these ores became marketable. Lessees, knowing this fact, in many cases reaped good profits, but that branch of leasing also was soon overdone and rendered unprofitable by excessive royalties. The facts are that the companies owning mines have begun to expect about all there is in a mine, and about as much more as they can get out of the average lessee. This accounts for some of the largest properties in camp being worked wholly under lease.—*Review.*

The bullion yield of the Con. California and Virginia mine for October was \$339,814, assay value of bullion representing a total gold value of \$282,000. This yield comes within less than \$5000 of covering the October expenses and November dividend.

The copper production of Butte, M. T., this year will crowd 120,000,000 pounds. And yet there is not a copper mine in the district that is developed below the 1000-foot station.

A. MONTIRICHARD, a miner employed at the Kennedy mine, Anador county, was drowned last week by falling into the sump.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CRAIN MINE.—Amador Dispatch, Nov. 24: This prospect, at Crain's ranch four miles above Plymouth, looks well. They are putting up an arastra for prospecting purposes. The Wildman mill at Sutter creek is shortly to be enlarged by the addition of ten stamps. The rock on the lower level is the best in the mine.

SOUTH SPRING HILL.—This mine continues on in the even tenor of its way. They have just put in a new hoisting engine of greater power than the old one. Something very much needed.

KEYSTONE.—The report that this property was about worked out is entirely false. The mine does not pay its old-time dividends of \$40,000 per month, yet it continues to turn out handsome profits for its owner. An abundance of good rock is in sight, and the Keystone will continue for years.

COSMOPOLITAN.—The east crosscut at this mine is in 40 feet. The ground continues to be very hard.

NORTH CALIFORNIA.—At this property they are crosscutting west. The company has secured the old Potosi mill and are giving it a thorough repairing. They expect to start crushing about the 10th of December.

GOVER.—The Gover mill has started again. They have plenty of water now. The new pipe will be connected with the hoisting works next week.

SOUTH SPRING HILL.—Ledge, Nov. 24: At this mine they are taking advantage of the idleness of the mill on account of scarcity of water, by changing the engine at the hoisting works. The engine heretofore in use is too small.

THE STRIKE IN THE NORTH STAR.—The developments in the North Star continue of a favorable character. A parcel of 60 pounds of rock was taken out the other day and pounded in a mortar, and yielded \$47 in free gold. The seam is still small, and in itself constitutes but a small step in the making of a mine. The great importance to be attached to it is in the promise which it holds out of further and more important developments. The drift has been run on the vein for 20 feet, and the ore body shows a tendency to widen out. The place where the quartz is found is fully 600 feet from the south boundary of the claim, so that there is ample room for an extensive ore chamber to exist within the limits of the mine.

MISCELLANEOUS.—The Plymouth Consolidated is engaged in hoisting water out of the shaft. The process is tediously slow, only one shift being employed. At the Talisman, which lies between the South Spring Hill and North Star, a test crushing of ore taken from the 900-foot level is being made at the South Spring Hill mill. They have a 4-foot ledge, and those who are well qualified to judge say there is no question about the rock being of a paying character. The section along the main belt between Amador and Sutter creek seems to be bigger with promise of mineral wealth than any other section of equal extent in Amador county. T. H. Goodman has a few men at work on the Quartz Mountain Overplus, making preparations in regard to the water supply for a resumption of work.

Calaveras.

TUNNEL.—Mountain Echo, Nov. 24: The tunnel of the London mine, owned by Reed & Jones, situated in Alhambra Flat district, is being pushed ahead quite actively. The boys expect to tap the ledge in a short time. This mine is in the slate and gouge formation and similar to the famous Gwin mine. The ore is also of the same character.

UTICA MILL.—Mountain Echo, Nov. 24: The recent rain has interrupted the carpenters employed in the erection of the Utica mill. The weather being clear at present, work is going on as actively as ever. The workmen are anxious to get the mill under cover before another storm sets in.

El Dorado.

ACTIVE.—Georgetown Gazette, Nov. 22: Judging from the stir now being made among prospectors and miners generally, an unusual amount of mining will be done this season.

LONE JACK.—We understand that the Lone Jack mine, this side of Garden valley, was started up last Monday under a new company. Nine men have been put on, lumber is being hauled for a boarding-house, and we hear that five more stamps will be added.

Inyo.

BELLEVILLE.—Inyo Independent, Nov. 10: Mr. C. A. Cross, superintendent of the Belleville mills, was at Independence this week. The mills have now been idle a long time and Belleville deserted in consequence. There is plenty of ore in the mines that would pay a fair profit with silver at or near its former value, but it will not pay to work at the low value of recent times. Very good reports come from the Dark Horse mine. About 12 men are at work there.

TIN.—The ledge of tin ore recently discovered by A. J. Davis near Independence station appears to improve rapidly with depth. Mr. Davis has men at work sinking a shaft. The ledge is now wider than the bottom of the shaft and the ore looks well. Geo. Storey has taken out about 80 tons of ore at the Poleta. It will be sent to the Maxim mill to be worked.

Los Angeles.

THE CORA BELLE.—Cor. Newball Times, Nov. 24: A fresh crew of men arrived to-day, and commence work tomorrow. The Rudd machine is working to perfection, and its equal was never seen; the company expects to pay a good dividend in January. There was plenty of rain last week and the creek got pretty high, but did not delay matters over half a day, repairing ditches, sluices, etc. The water washed away a box of fine tools, and one of the men struck it right when he said: "Oh, a few hours' work will turn out gold enough to pay for that, even if they are high!" I confidently think that there will be a hundred of these machines in the mountains within the next three months, each employing at least a dozen men, and paying good dividends. Prospectors are coming in in full force, for

the mines are advancing in value since Rudd's machine came into the district.

Mono.

OLD MONO DIGGINGS.—Homer Mining Index, Nov. 20: The Old Mono Diggings have yielded millions and are not worked out. There are fortunes in them yet, and some day they will boom again "on merit." Nearly every prospector and mine-owner in Homer district has visited Old Mono, and some were residents there in the palmy days that followed the discovery of gold. It is an interesting section and so near Lundy as to be no more than an appetizing walk for healthy men. Every now and then some of our prospectors, several of whom keep up annual work on their locations there, start in afresh to revive the old camp by resuming operations on quartz and placer claims, hoping to "make a strike," such as enlivened things at Monville and Dogtown in '62-'3. A few Chinamen still work there and some seasons make fair wages. There are several quartz veins from which considerable gold has been extracted by arastra process, but prospectors of limited means cannot continue operations to any great depth because of the heavy flow of water. The Virginia creek hydraulic mine, of which D. E. Jones is superintendent, is worked every season and employs quite a number of men, producing considerable quantities of gold. No doubt there are other localities to that section which would do as well if capital were employed in the same manner.

GOLDEN PRINCE.—Work will be resumed on the Golden Prince mine as soon as Amiot's mules finish packing May Lundy ore. Supplies for five months will be laid in, and the miners will barricade the portal of the tunnel and bid good-by to the rest of the world until spring thaws them out.

Nevada.

WASHINGTON.—Cor. Nevada City Herald, Nov. 24: The new mill at the Erie mine is in successful operation. It is an experiment, but it is believed by those competent to judge that it will prove a success. J. R. Richie went to Grass Valley last week, where he will put in several concentrators in that vicinity. Mr. Richie has a concentrator of his own construction, which is said to possess excellent features not before used. The cleaning of the bedrock at the Omega hydraulic mine is about completed, which will close the work for the season. Handicapped as the company is, they show commendable enterprise in pushing the work forward.

OLD MEADOW LAKE.—Virginia Enterprise, Nov. 22: E. D. Towne, who has just returned from Meadow Lake, says they are now successfully working the ores of that camp, and by a very cheap and simple process. It is a mechanical, not a chemical process. The veins of the camp contain a vast deal of iron and the gold is all rusty. It is therefore useless to attempt to amalgamate it on copper plates. It is caught in sluices similar to blanket sluices except that the bottoms of the sluices are covered with ordinary canvas. Blankets catch too much iron. Little besides gold remains on the canvas, and that is held so closely that it is almost impossible to wash it off. That which is caught besides gold is in the shape of particles of iron containing gold. The stuff saved in the sluices is so rich that it is worth about \$5000 a ton. This is roasted and is then ground in a pan. The grinding process so brightens the gold that it readily amalgamates. The slum that results from this grinding is blood-red. It makes a superior fire-proof paint and can be sold for about 3½¢ a pound. Several of the mid-time claims now pay a good profit by the simple process of working described above. Mr. Towne, who has long been down in New and in Old Mexico, says he thinks the chances better in Meadow Lake than in any place he has seen. He expects to see the old camp very lively next summer. Nothing will be done there this winter at milling ores.

THE MOUNTAINEER.—Ore enough is being taken out of the Mountaineer to keep the mill steadily running and the shaft is well under way for new levels. It is proposed to push it down to a depth sufficient to determine what is below.

THE MERRIFIELD.—The mill at the Merrifield is being run on tribute rock from ground north of the works. They have about 160 tons on the dump, which shows well on the plates and would seem to justify more extensive work than is being done.

Placer.

HEAVIER MACHINERY.—Placer Argus, Nov. 24: The Gray Eagle mine is being fitted up with heavier machinery. They have bought a 75 horse-power engine and two large Cornish pumps, a jack head and a plunger. There are three large boilers in position and the other machinery is being put up as rapidly as possible. A large building, 50x70, is to be erected and work in the shaft will be resumed in about a month.

THE HOGSBACK MINE.—Placer Herald, Nov. 24: This mine is about 2½ miles above the Indian Springs house, and extends in nearly an easterly direction across the divide. It has been prospected for years by a company that had sufficient faith in it to start a tunnel, which was subsequently abandoned on account of its being too high. In 1886 the mine was bonded to the French company which owned the Golden River, Red Point, and other claims in the Iowa Hill and Damascus mining districts. This company on May 1st of that year began grading at a point 500 feet below the top of the main ridge and 40 feet below the mouth of the old tunnel. On the 18th of May the tunnel was started. For 244 feet the tunnel was run by hand, but the remaining distance has been run by Burleigh drills. On the 3d of October last the tunnel had been driven into the mountain 900 feet, and at the present writing is 1300 feet in length. The rock is quartzite of varying hardness, but never so soft and shelly as to require timbering. At the 900-foot point the rock was extremely hard, necessitating the use of several drills to put in a hole for blasting. Although the rock was hard at the entrance, as high as 48.7 feet were made by hand drilling in one week. The Burleigh drills have made 73.5 in one week. The grain of the rock, which at the mouth crosses the tunnel at the distance of 900 feet, swings around 90 degrees, or, in other words, is parallel with the direction of the tunnel. This is a curious fact, and the change of direction is supposed to have been caused by the breaking down of the outer portion of the rock by some convulsion of nature. The tunnel is 7x8 feet and extends in a straight line on a grade of three-eighths of an inch to 12 feet, and is compara-

tively dry. The drills are run by compressed air. William Ralston is superintendent and J. T. McCall foreman of the mine. These young men deserve a deal of credit for the efficient and systematic manner in which they have managed the enterprise. They can give some of the veteran miners points in developing a mine. The tunnel has been run so far at a comparatively low cost, not exceeding \$12.42 a foot, including materials.

THE PIONEER QUARTZ MINE.—Herald, Nov. 24: This mine is situated near Damascus and is the property of ex-Senator Fair. The ledge is a big one, varying from a few feet to 40 feet in thickness. The tunnel is over 600 feet in length, and drifts have been run from it for a considerable distance along the lode. The rock is good milling-ore and very rich prospects have been taken from it. The company has built a very good wagon-road from the top of the ridge to the mine. The greatest undertaking is the building of a tramway from the mouth of the tunnel to the mill which is in process of erection in Humburg cañon. This tramway is 2430 feet in length, and is a trestle on which are laid the rails. The grade for a distance of 450 feet is about five feet to the rod. The cars will be run by an endless cable. A ditch has already been dug along the hillside to Damascus cañon, where dams have been built for the storing of water. The mill will have 20 stamps and will be ready to crush ore by the time water comes. This enterprise has given employment to quite a large force of men this fall, and will give quartz mining a new impetus in the Damascus mining district.

San Diego.

PERRIS HAS A MINING BOOM.—Perris Leader, Nov. 22: One year ago there was not a mine being worked in the entire Pinacate or Gavilan districts, 100 miles north of San Diego city, on the line of the California Southern Railway. To-day, upward of a dozen properties have been developed, and many of them being now prepared to place tons of good rock on the dump or at the stamp mill. The Moer mill will run hereafter as a custom mill, thus placing the means for successfully reducing ore and putting it into marketable dust in the hands of every miner in the district. A large force of men was put at work around the mill and mine last Saturday and kept busy pumping water out of the numerous shafts and making general repairs on machinery and shaft timber.

THE ALLEN.—A 50-ton sample of ore was taken out of the Allen mine last week and shipped to the National City sampling works. The result has not yet been made known, but should it prove satisfactory to the syndicate of St. Louis capitalists who own the mine we may confidently expect to see a large force of men put at work and the mine pushed to its full capacity. Old Menifee Wilson and partners took \$16,000 worth of yellow dust out of this property before they sold it to the Allen Co.

THE PLOMO MINE is the property formerly owned by Mr. Steele. He still retains an interest in the property, being one of the company formed several months ago to further develop the property. A shaft had been sunk to the ore and a tunnel commenced from a lower elevation to run horizontally into the hill until it intersects the shaft. This work has been going on steadily for weeks and but 100 feet of tunnel remains to be driven. The company has set up a hoisting apparatus. The product of this mine will be handled at the Moer mill.

THE CORONADO CLAIM.—A half interest in the Coronado claim was sold last week at a satisfactory price. The property is in the old Pinacate district, near Armentrout's place, where so much excitement has lately been created by rich discoveries. The opening and development of these properties has caused a rise in the valuation of other claims and a corresponding rise in the hopes of the owners. A majority of the properties are really valuable, inasmuch as gold in paying quantities can be taken from the ore. With increased facilities and reduction works near at hand the operating expenses will be reduced and the profit accruing to operators correspondingly increased.

THE REDUCTION WORKS.—National City Record, Nov. 24: The first cleanup of the National City Reduction Works occurred this week. The figures, of course, are known only to the managers of the works and owners of the bullion, but the run is said to have been a profitable one to all concerned. The bullion belonged to Ashenfetter & Co. of San Jacinto, who have the distinguished honor of receiving the first ever turned out of reduction works in Southern California. The success of the plant has been fully demonstrated, and it will be of incalculable benefit not only to National City, but in developing the mines of the county. A plan is now on foot to incorporate and secure enough paid-up capital to build a smelter and refiner without delay.

Shasta.

STARTED UP.—Redding Free Press, Nov. 24: Frank Wheeler of French Gulch has started up his five stamps since the rain, and in a few days will have 15 to 20 men employed in his mine and mill. The former is being developed systematically.

MILL MOVED.—Andrew Fife, who was in town last Tuesday, informed us that he has moved his quartz-mill from Old Diggings over to Flat creek to crush the rock taken out of the Haskell & Mott mine during the last two months. Big results are anticipated.

Sierra.

FOREST CITY.—Mountain Messenger, Nov. 24: The contract for sinking the shaft in the South Fork main tunnel has been let to Wyllie & Bradbury, price \$5.75 per foot, considered remarkably low. The object is to reach the bedrock in the channel. No one can tell how deep the contractors will have to sink, as the bottom may be reached in 10 to 30 feet below. Everybody is standing on tip-toe, awaiting developments, as very much depends upon the result of the present move.

RICH ROCK.—Cor. Mountain Messenger, Nov. 24: Last week, in company with B. F. Giddings and Capt. D. D. Wheeler of San Francisco, and F. R. Wehe, we visited the Gold Bluff quartz ledge, where we met Mr. Van Slyke, the proprietor of the mine. Samples of rock just brought out of the mine were very beautiful. The quartz was of milky whiteness, with bands of sulphurets of iron, galena and gold, the latter seeming, to the eye, to predominate. The white quartz bordering on the sulphurets was studded with gold on either side. The sam-

ple would run way up into the thousands of dollars to the ton.

Trinity.

NEW DITCH.—Trinity Journal, Nov. 24: The Trinity Gold Mining Co. has about two weeks more work on the new ditch. The completion of this ditch will give them earlier water in the winter and increase their water-supply through the season, and will be of material benefit in working the claim. Hon. W. T. Coleman of San Francisco was in town this week and went to East Fork mining district to look after his mining interest there. He expresses himself as favorably impressed with the outlook of his mine.

NEVADA.

Washoe District.

CROWN POINT.—Virginia Enterprise, Nov. 22: The prospecting drifts are in promising material. From these drifts over 240 tons of ore have been taken and shipped to the Mexican mill. Some repairs are being made to the hoisting works.

BELCHER.—A considerable amount of prospecting work is being done at several points from the 200 level downward.

SEG. BELCHER.—Good headway is making in the joint Belcher east drift on the 1100 level. Some stringers of quartz are showing in the face.

BALTIMORE.—Continue to extract high-grade ore from the upraise above the 338 level.

JUSTICE.—Ore assaying from \$20 to \$30 per ton is showing in the winze bottom, 38 feet below the 490 level. The new mill started up last Sunday and is working well and smoothly.

BULLION.—Explorations on the 500 and 640 levels have developed favorable indications for ore.

SIERRA NEVADA.—No. 4 west crosscut on the 520 level is still in quartz and porphyry.

UNION CON. AND MEXICAN.—The joint Union drift on the 1465 level is now in Mexican ground a distance of 143 feet.

YELLOW JACKET.—The hoisting works are working finely, and are shipping ore steadily to the Brunswick mill.

CHOLLAR.—The raise from the north drift on the 650 level continues in low-grade quartz. The west drifts on the 750 and 850 levels are still in clay and quartz.

POTOSI.—The 650 level south drift is showing clay and porphyry.

ALPHA.—The 500 level north lateral drift is north of the shaft 167 feet; the face is in clay and quartz. The south lateral drift on the same level is in south of the shaft 72 feet; the face is in quartz that assays from \$12 to \$20 per ton.

ALTA.—Extracting, crushing and concentrating 30 tons of ore daily, battery samples assaying \$63 per ton. Stripping 900 level ore by north and south lateral drifts.

SAVAGE.—On the 400 level the southeast drift was extended 15 feet; total, 49 feet. The northeast drift was extended 18 feet, total, 89 feet. Ore is being stoped from the north and southwest drifts on this level. Ore is also being extracted from No. 1 east drift and from the sill floor on the 500 level, from the 12th floor north from the 600-level chute and from the old stopes on the 450 level. The usual repair work is being done. During the week 624 tons were shipped to the Rock Point mill, the average battery assays of which were \$78.60 a ton. Bullion on hand, \$3204.24.

GOULD AND CURRY.—On the 450 level the west crosscut, 60 feet from the top of upraise from the 500 level, has been extended 30 feet; total length, 80 feet. Formation, quartz giving low assays.

BEST AND BELCHER.—On the 300 level the winze in west crosscut No. 1, 120 feet from the main north-west drift, has been sunk a total depth of 19 feet, passing through ore of fair quality. On the 625 level the work of repairing the main north drift is still in progress.

CON. CALIFORNIA AND VIRGINIA.—The usual quantity and quality of ore is being extracted from the breasts on the 1400, 1500, 1600 and 1650 levels. The prospecting drifts on the later level are passing into promising material at one or two points. Ore of a fair quality is being found in the old stopes at the south end of the mine on the 1950 level. The usual amount of ore is being shipped to the Eureka and Morgan mills. The California mills have been shut down for the purpose of making a cleanup.

SCORPION.—Still crosscutting from the 300 level north lateral drift.

ANDES.—Explorations resumed on the 350 and 240 levels.

OVERMAN.—Continue shipping 40 tons of ore daily to the Vivian mill.

OPHIR.—On the 1465 level the south drift started from the end of the old east drift from the shaft station, 300 feet in, is extended 203 feet and continues in a porphyry formation.

HALE AND NORCROSS.—On the 500 level, west drift has been extended 30 feet and is in a distance of 605 feet. The north drift was advanced 22 feet. This drift has been connected with the Savage crosscut on the Norcross northern boundary, which gives a good circulation of air. The west drift to connect with the north upraise has been advanced 25 feet and the north drift from the 6th floor has been advanced 10 feet in good ore. During the week there was hoisted 128 tons of pay ore from the 700 level.

CONFIOENCE.—The face of the raise from the 1200 level is still to ore of fair grade. A joint Challenge raise is to be made from the 1300 level. The daily shipment of ore to the Brunswick mill amounts to 144 tons, the average of which is \$23 a ton.

CON. IMPERIAL.—Repairs to the north drift on the 1100 level will soon be completed, when work will be resumed in No. 1 crosscut.

CHALLENGE CON.—An upraise joint with the Confidence is about to be made to prospect for the continuance of the vein below the 1200 level. The raise will start from the 1300 level. The daily average of ore shipped to the Brunswick mill is 35 tons. It assays (battery samples) \$23.39 a ton.

NORTH OCCIDENTAL.—This mine will be worked through the Occidental under the superintendency of Mr. Lyman. As a vein of paying ore has been

followed nearly to the line in the Occidental, the North Occidental starts off under favorable auspices.

UTAH.—The new station at the 600 level is about completed. From this station a drift will be run west to the vein.

OCCIDENTAL.—The north drift on the 100 level has developed a five-foot streak of ore that assays \$50 a ton. A considerable amount of ore has been extracted during the week and saved for crushing.

Bristol District.

OHIO.—Pioche Record, Nov. 17: The Roe Bros. are preparing to extract copper ore from the Ohio mine. A new wagon-road on the mountain-side is necessary, the making of which requires the removal of a large part of the old dump. It is now half finished, and it is expected enough ore will be found in the dump to pay for the whole work.

FURNACE.—E. Basset has been engaged for some time in constructing a small natural draft furnace for the reduction of copper ore. He hopes to have it in running order by December 1st. A furnace built there by him several years since on the same principle answers admirably for working lead ores, but some changes were necessary to protect the metal from drafts of cold air; this he thinks is now accomplished.

Jackrabbits District.

HOISTING PLANT.—Pioche Record, Nov. 17: The work of putting a steam hoisting plant on the Onondaga mine is progressing nicely. The excavation for the galloways frame and engine are made and the galloways frame about completed. It is expected the plant will be in running order in two weeks.

Pioche District.

AT WORK.—Pioche Record, Nov. 17: There are now over 30 men working for wages in the Pioche mines and paid regularly. Small as this may seem, it is an important matter for us. It makes a solid basis for what little business is done.

Safford District.

ASTRIKE.—Eureka Sentinel, Nov. 20: We see an item in some of the State papers to the effect that a very important strike has been made in the Onondaga mine, this county. The ore is said to go from \$200 to \$300 a ton. Several carloads have been shipped to Salt Lake. There is said to be plenty of high-grade ore in sight in the mine. The Onondaga property is owned by a San Francisco company. George Obriter, a thoroughly competent mining man, is in charge as superintendent. He is working a small force which may now be considerably increased. We are glad to hear of this development in the northern part of Eureka county. There are many other promising mines in Safford district. Cortez and Safford are two pretty good mineral sections in Eureka county territory.

ARIZONA.

CASA GRANDE.—Florence Enterprise, Nov. 10: From Mr. C. Loss, Supt. of the Golden West Mining Co., the following mining items from the Casa Grande mining district are obtained: Mr. Loss has been instructed by his company to receive proposals for 75,000 feet of lumber and timber for the erection of a mill at the Golden West mine, in the Bitterwell mountains, south of the Vekol. A 10-stamp mill is to be erected and the plant has been ordered. The mine has been crosscut for 36 feet through ore, and the wall has not yet been reached. Last month 150 feet of work was done, and the average of the ore sampled \$22 per ton in gold. A sample of 60 tons gave \$35.30 tons went \$57 in gold and between 60 and 70 ounces in silver. The outlook for this grand mine is very promising. Mr. Chris. Johnson is the foreman. The Ella Co., owning the properties recently held by the Monarch Co., is about to erect a 60-stamp mill. The outlook for this property is at present very encouraging. The Great Eastern, owned by Howell Hinds and L. D. Chilson, on the Vekol lode, has developed an eight-foot vein in place, of very rich ore, and the value of the property has thereby been greatly increased. The Vekol mill is to start up at once on ore from Argosy claim, belonging to the Messrs. Walker, and a good long run is expected to be made. The ore from the Argosy is of excellent grade and promises well. The Jack Rabbit mine, owned by W. C. Smith, has a carload of ore out that will net \$5000. A shipment of three carloads of this character will be made shortly. The Central Silver, in the east drift from the shaft, has made a crosscut showing 15 feet of ore. The west drift, at 100 feet from the shaft, shows nine feet of ore by crosscutting. This is on the 200 level. The shaft is down 235 feet and sinking is still in progress. The outlook for the district in which the above properties are located was never brighter than at the present time, and they are likely to give excellent returns as bullion-producers when the mills are set in motion.

PRESCOTT.—Journal-Miner, Nov. 22: T. J. Dunkle left to-day for Turkey creek, where he will put a force of men at work on the Scotch Lassie mine. The ore receipts at the sampling works, on Saturday, amounted to over 30,000 pounds, as follows: Congress, 24,000 pounds; Belle, 3500; Blue Dick, 3000. S. E. Fuller is working the old Marcus mine and getting good ore, which he will have worked at Kerr's mill, and ship the concentrates through the sampling works. A deed from James W. Aker to H. Goldwater and F. H. Taylor, for one-half of the Trap Rock mine, Walker district, consideration \$2000, has been filed for record. John McDermid continues to work a gold property on Lynx creek. He has been overhauling a big water-wheel to run an arastra, to work the ore with Charles H. and James Akers left to-day with a wagon-load of supplies for Lynx creek, to commence operations on their Trap Rock mine. J. R. Slack has purchased a half interest in the old Bullwhacker mine from John Curtin, and expects to commence work soon taking out ore. This mine has already made a big yield of good gold ore. F. M. Murphy, who returned yesterday from the Congress mine, says the main shaft is now down to a depth of 500 feet in good ore all the way. A level is being run at the above depth, while the work of sinking continues. Doc Bowen has returned from doing the assessment work on the Gray Eagle in the Bradshaw mountains. He says he struck very rich gold ore, running up in the hundreds of dollars per ton. Messrs. Harlan & Barrington, owners of the famous Howard mine, were in town to-day, with a bar of gold valued at \$1199 taken from the Chloride and Hoosier Boy claims, adjoining the Howard, and are

getting the Howard in shape to continue working it also. Dr. Day, who has recently returned from Weaver district, says that A. L. Kerr started up his new stamp-mill a few days ago on good gold rock, and everything was working satisfactorily. If the experiment proves entirely successful, and it is demonstrated that the ores can be worked successfully, the capacity of the mill will be increased. James Shirley returned yesterday from a trip through Turkey creek and the Hassayampa district. He says miners in those sections are hard at work taking out ore for shipment. Fred Sattes has opened up a splendid body of ore in the Alligator mine in Crook canyon. He has the shafts, drifts and tunnels all cleaned out, and Mr. Shirley says the property is looking exceedingly well.

WATERVILLE.—No sinking is being done at present in the main shaft. The station at the 500 is nearly completed. The usual development work throughout the mine is being done, and the usual ore shipments made.

BRITISH COLUMBIA.

SIX FEET OF ALMOST SOLID GALENA.—Donald Truth, Nov. 24: Last July a discovery that promises well was made on Toby creek. The ledge is a well-defined one with slate and granite walls. It is 24 feet from wall to wall, carrying mineral the entire width. The pay streak is fully six feet wide of almost solid mineral. The ore is a cube galena, carrying silver and a little gold. An assay made at Ottawa gave a return of \$66 in silver to the ton, and one made by McVicker of Salt Lake, Utah, gave \$72 in silver and \$1 in gold to the ton, besides going 78 per cent in lead. The district is about 20 miles up the creek, and a trail can be cut in at no great expense, as the country is not a rough one. There is close by an abundance of timber for mining purposes. William Rosamond, William Kirkpatrick and Geo. Stark, all of Golden, are the locators and owners of the claims. Toby creek empties into the Columbia from the west at a point about 100 miles up the river from Donald.

THE MCMURDO DISTRICT.—About a month ago Geo. McCabe secured a bond on several claims in the McMurdo district, intending to place them on the other side, but he did not go further than Vancouver for the needed capital. He passed through Donald Thursday on his way to Golden, intending to try and get supplies into the district so as to put men to work this winter. He will undoubtedly succeed, as he is evidently a hustler from way back. Lowe & Dainard sent a sample from their Crescent claim to McVicker of Salt Lake for assay. The return was \$226.03 in silver and \$8.44 in gold to the ton, besides 39 per cent lead and 11 per cent copper. Pretty good rock. McMurdo is likely to rival Toad Mountain in both extent and richness.

DAKOTA.

FLOAT.—Deadwood Pioneer, Nov. 22: President Franklin, of the Retriever Company, yesterday contracted for the transportation from the mine to the reduction works of 500 tons of ore, with privilege of more. A large amount of Golden Reward ore is already delivered at the reduction works, and is arriving at the rate of 10 tons per day. The waterworks system of the reduction works is quite an institution of itself, and complete in every detail. Two carloads of coke having been received, the Silver Queen smelter was started up again yesterday morning. A large quantity of ore is on hand, and the chances are that 50 to 60 bars a day will be turned out continuously henceforth. Good ore has been struck on the Lew Wallace ground, and the stock is likely to be in brisk demand before the close of the week.

MONTANA.

STRIKE IN THE DANIEL QUILP.—Inter-Mountain, Nov. 21: The lessees of the Daniel Quilp, a well-known property located in Deadwood gulch, and adjoining the Narrow Gauge on the west, have, it is reported, made an important strike of ore on the 150-foot level. At this point a level has been run in westward 300 feet and a crosscut driven about 20 feet to the north ledge, where a body of ore of good thickness was exposed, running between 50 and 60 ounces in silver. The lessees are William P. Forbis, who is a part owner in the property, and Mr. Fitzgerald of Gans & Klein's. They have enough confidence in its value to put up a new hoisting works, now nearly completed. Development is still progressing.

COBALT, TIN AND NICKEL.—John Ducie of this city, who has been mining in this Territory for the past ten years, while on a prospecting tour in Jefferson county recently, discovered a deposit of ore about 20 feet in length which struck him as something entirely different from the ore generally found in Montana. He broke off several pieces and brought them into Butte and had them sampled at the Williams smelter. The investigation by an expert chemist and assayer proved the rock to bear cobalt, tin and nickel, and to be especially valuable for the cobalt. Since snow has fallen, further investigation is impossible at this season. Mr. Ducie has not yet made a location and does not tell in which particular section of Jefferson county his discovery is located, and says there are no other mines in the vicinity, but he says the general formation of the country is of slate and porphyry. He intends to visit the place early in the spring for the purpose of further exploration. Mr. A. Eilers, of the Great Falls smelter, was in the city yesterday and stated that the company had just closed a contract with the Tiger Co., in the Coeur d'Alenes, for the purchase of all their product. About 15 cars of lead ores, he stated, are daily being received at the smelter, and preparations are being made for starting up all the furnaces.

NEAR TOWN.—New Northwest, Nov. 16: What promises to develop as a prosperous mining district, and is quite accessible, being only about eight miles east of town and some 3½ miles east of William Zosel's place, has been opened up to some extent this fall. The first discovery was made August 3d of this year, and the locations so far made are on Rocker and Deep gulches. Joseph Patterson and Jack Devlin have worked some on the Hidden Hand, and have out to 10 or 12 tons of ore that is estimated at 50 per cent lead and carrying 100 ounces of silver and have as high as four feet of lode. William and Gus Zosel have also made two or three promising locations. They are now building cabins and a road from Zosel's ranch and expect to work

on the mines all winter. W. P. Emery has also located the Carbonate Hill lode, from which he took a carload of ore which he this week shipped to Butte. It carries lead, gold and silver, and he expects a fair working result from it. The impression is that there are some good veins there and that the camp will turn out well as it is developed.

OREGON.

BLUE RIVER DISTRICTS.—Albany Herald-Democrat, Nov. 24: Messrs. Standish and Dyson of Brownsville returned from the Blue River mines last week. The Croesus claim has just got the returns from a ton of ore shipped to San Francisco. It milled them between \$79 and \$80, mostly gold, and the fate of the camp that has been so long hanging in the balance is at last decided, and there is much rejoicing; for now a road will be built and a mill go in the spring, and the work of active development will begin in real earnest. President John G. Wright of the Capital G. and S. M. Co. has received a letter from Supt. Anglin of the Capital mine, on the Santiam, to the effect that the mine is turning out a quality of ore that exceeds his highest expectations, and the quality of the ore grows better the deeper the shaft is sunk. The shaft is now down to a depth of 30 feet from the level of the tunnel, which is run from the base of the mountain. A few days ago a body of spar was reached that matted into almost pure copper when placed in a blacksmith's forge. The ore now turned out is said to be the richest ever found in the Santiam district. The members of the company are highly elated at the excellent prospects.

UTAH.

MINING REVIEW.—Salt Lake Tribune, Nov. 23: The output for the week has not been large; the attention of mining men is largely devoted to laying in supplies for the winter, and there is a general disposition to refrain from pushing production until the new administration comes in, the hope being that the Mexican lead ore imports will then be better regulated, and that something will be done for silver. The receipts in this city for the week were to the value of \$99,064.64, of which \$58,390.80 was bullion and \$40,673.84 was in ore. For the previous week the receipts were \$81,850.64, of which \$52,767.16 was in ore and \$29,083.48 was in bullion. The Ontario product for the week was in bullion, 20,363.22 fine ounces; no ore sales. The Daly output for the week was of bullion 16,099.17 fine ounces, and \$8161.46 from ore sales. The Horn Silver is quiet. No accounts are heard of ore extraction or shipment. Fine bar receipts in this city for the week were valued at \$16,099.17; base bullion, \$13,440; gold bar, \$797. The Hanauer smelter produced during the week bullion valued at \$18,435; the Germania, \$9619.63. Ore receipts in this city for the week were to the value of \$19,622.62 by Wells, Fargo & Co.; \$18,450 by McCormick & Co., including \$11,250 Crescent and \$1400 Queen of the Hills; and \$2601.22 by T. R. Jones & Co.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Nov. 29, 1888.

Trade the past week was quiet in all lines, due to the early approach of the holiday season and also to the general custom of winding up as far as possible all business at the close of December so as to commence the New Year with a thorough knowledge of how the business stands. Merchants report collections good, better than at this time in 1887. The banks report, as a rule, deposits increasing, with a falling off in remittances to the East for the purpose of meeting maturing obligations. They also report a lessened call for funds for grain, local securities and mining stock speculative purpose, with brokers dealing in the latter generally having a stronger account. Although reporting this, they look for an early revival of a boom movement due to stocks being concentrated by parties who buy to sell at a good profit, an improvement in several of the mines on the Comstock, and the payment of a dividend in next month by Confidence and Con. Virginia to be followed at an early day, unless some unforeseen event takes place, of dividends by the Hale and Norcross and Navajo, with a strong probability that Savage, Chollar, Potosi and two or three others will fall into line. With an active stock campaign, money will be in demand at good rates of interest.

SILVER.—Complaints are still heard of a scarcity in the supply and buyers at times compelled to pay a point or two above the European parity for spot parcels. Sales were made the past week at 94 to 94½¢, but at the close 93½¢ was bid and 93¼¢ asked. It is generally believed that next month there will be a most decided increase in the bullion output of the Qujotona, Tuscarora and Comstock districts, particularly in the latter, owing to more stamps dropping than for over ten years past. The ore, too, it is claimed, will generally average higher. This opinion is based on official and semi-official reports from the mines of important work now going on in Con. Virginia and other North-End mines, also in Hale and Norcross, Alpha, Exchequer, Challenge, Confidence and Yellow Jacket, with important work soon to be started in Seg. Belcher, Belcher, Crown Point and Con. Imperial. The Alta groups of mines are also beginning to attract attention. Of necessity, time will tell the story. The work in West Con. Virginia is being watched with a great deal of interest, owing to the expectation that it will demonstrate the fact of a west lode and also its value.

QUICKSILVER.—The demand on this coast is not up to expectation, although it is claimed that there will from several localities be a gradual increased consumption from now on; but, of course, this depends very materially on the result of the work now going on in several of the most important mines in each mining district. The export demand is fair.

LEAD.—The market is slow. Buyers appear to

be looking for a lower range of values. Spot is 10 cents lower.

COPPER.—The demand continues of an offish character. Dealers and consumers alike only buy in a hand-to-mouth way unless tempted by lower prices from outside sellers. The "syndicate" still holds a strong line on the market, compelling the most of consumers and dealers here and elsewhere to confine their purchases to them. All present information is confirmatory of a large increase next year in the output of this coast.

TIN.—Pig is tame, owing to consumers and dealers holding off for future developments. They are strengthened in this by the action of the European and Eastern markets. Plates are slow; spot continues weak. For that on the way the market is reported to be dull, as heavy consumers have bought to arrive their expected early wants in 1889, and therefore prefer to wait the future before buying more.

IRON.—The market is without essential change. The demand is slow, with consumers not disposed to buy much until the turn of the year.

COAL.—The market under heavy receipts and a light demand is weaker for both spot, nearly due and prompt shipment. For Australian it is reported that further concessions have been made, although quotations are not much lower. It is said that for April and May, sales have been made as low as \$9 and even \$8.50 per ton. Domestic coals are coming in more freely, with prices tending to lower figures.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Nov. 29, 1888.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday.....	43½	44½	\$17 50	\$8 70	\$22 45
Friday.....	43 1-16	44 1-16	17 55	8 65	22 50
Saturday.....	43	43½	17 50	8 70	22 50
Sunday.....	43	43½	17 50	8 70	22 45
Tuesday.....	43	43½	17 50	8 65	22 25
Wednesday.....	42 15-16	43½	17 50	8 70	22 20

The market closed as follows: The recent advance in horax repels some buyers. There is no wavering in rates. California refined is quoted at 8½¢@9¼¢; concentrated, 8¢@8½¢. Lake copper was released as wanted by consumers at 17½¢; best, 16¢@16½¢. There was a large offering of pig lead at 2½¢@3¼¢. Refined petroleum—Barrels, \$7.25; plain cases, \$9.25.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

Prices generally ruling for metals not regularly dealt in on Call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, —@—; Billiton Tin, \$24.50@—; Banca Tin, \$24.25@24.50; Baltimore Copper, \$—@—; Orford Copper, \$16.00@16.25; P. S. C. Copper, —@—; Foreign Lead, \$4.75@5.00; Foreign Spelter, \$6.00@6.25; Antimony, \$10.00@13.50.

TIN.—The fluctuation in prices abroad has been responded to from here with rather a sharper movement; and sales on our floor have also run up to a total of 130 tons. Demand has been chiefly for futures; which have, however, followed the general tendency of spot values.

COPPER.—Although an improvement over last week to the extent that one sale has been reported, the market could not in reality have been much more dull. Under these circumstances it is hard to say that prices have had any decided tendency, but if anything they have been somewhat easier.

LEAD.—Transactions are considerably heavier, reaching a total of about 650 tons, but the increased activity has not been very evenly distributed. Prices have become firmer, however, especially for futures.

SPELTER.—When noticed at all, has been dull and weak, the net loss being about 10 or 15 points. **PIG IRON.**—Furnaces manage to keep clear of accumulations, and although the demand appears to be a little less urgent, prices are firmly maintained. Sellers say they have plenty of inquiries, and that prospects are entirely satisfactory.

MANUFACTURED IRON.—A great deal of business is doing, but prices are irregular, and not as firm as was anticipated they would be.

STEEL RAILS.—A bid of \$27 at mill is said to have been refused recently by three different mills on the line of the Pennsylvania Railway. The order was for 15,000 tons at each mill. This information comes direct from an undoubted authority, and may therefore be depended upon as correct.

JOSHUA HENDY MACHINE WORKS,
 Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
 J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.
 W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
 And will furnish descriptive Catalogues and quote prices upon application.

THE ROLLER ORE FEEDER

(Patented May 23, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
 In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF
ANY WHEEL IN THE WORLD.
 And is everywhere recognized as the standard for high-
 pressure service.

UPWARDS OF 600 IN USE.

From 12 to 20 per cent better results guaranteed than
 can be produced from any other Wheel in the country.
 It is not only most economical of water, but the most
 simple and reliable power for Quartz Mills, Compressors,
 Hoisting, Pumping, or any other purpose where water
 power can be used.

ELECTRICAL TRANSMISSION.

Power from these Wheels can be transmitted by elec-
 tricity long distances with small loss, and made available
 for running Mills, Pumping and Hoisting Works, Tram
 cars, Electric Lights, etc. Address

The Pelton Water Wheel Co.,
 No. 120 FIRST ST., SAN FRANCISCO, CAL.

—THE—
PERFECTED
DOUBLE
Economic
Stamp
Mill.

BEST and
CHEAPEST
 In the World.

AFTER SEVERAL YEARS OF EXPERIENCE we have finally perfected this Mill.
 Our principal improvement consists in oscillating the stamps by means of sleeves with universal
 joints, allowing the stamps the utmost freedom of movement, without tendency to bind or
 cramp in the working parts.

Several Mines Using Them Have Ordered Others.

WE HAVE ALSO

A NEW ROCK BREAKER.

CIRCULARS WILL SOON BE READY.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. INGLETS—Arizona Territory.
A. F. JEWETT—Tulaco Co.
C. E. WILLIAMS—Yuba and Sutter Co's.
F. B. LORAN—Plumas, Sierra and Nevada Co's.
H. G. PARSONS—Oregon and Washington Territory
E. M. DEWEY—Tulaco and Kern Co's.
Geo. WILSON—Sacramento Co.
W. B. FROST—Stanislaus, Merced and Fresno Co's

The output of the coal mines near Albuquerque, N. Mex., is 450 tons a day.

For Market Report See Page 365.

MINING AND SCIENTIFIC PRESS.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Assessment Notices.

William Penn Mill and Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Devil's Gate Mining District, Lyon county, Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 8th day of November, 1888, an Assessment (No. 3) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 13th day of December, 1888, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 31st day of December, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. J. SCOVILLE, Secretary.
OFFICE—Room 69, No. 309 Montgomery street, San Francisco, California.

Lord of Lorn Gold and Silver Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Gold Hill Mining District, Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 13th day of November, 1888, an Assessment (No. 4) of Ten (10) Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 313 California street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 28th day of December, 1888, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 22d day of January, 1889, to pay the delinquent Assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

L. G. HARVEY, Secretary.
OFFICE—313 California St., San Francisco, Cal.

NEW SOUTH WALES.

THE GOVERNMENT OF NEW SOUTH WALES intend to establish METALLURGICAL WORKS on a scale sufficiently large for determining, in bulk, the best methods of treating Ores produced in the Colon.

A SUPERINTENDENT is REQUIRED to erect, control and direct these Works. He must possess the highest qualifications and widest experience, and it will be his duty to introduce the best methods of treating Ores, with a view to extract therefrom the metals and other substances possessing an economic value. He would also have to impart full instruction in the various methods of treatment, and to afford every facility to Smelters and Miners for acquiring a practical knowledge of the processes employed.

Applications, stating Candidate's age, accompanied by copies of testimonials, must be sent, on or before the 12th of December, 1888, to The Agent-General for New South Wales, 6, Westminster Chambers, London, S. W.

SAUL SAMUEL,
Agent-General for New South Wales.
1st November, 1888.

THE BUFFALO CONSOLIDATED GOLD

Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at \$1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No. 1, 32 ft.; No. 2, 9 ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

THE CALIFORNIA CONSOLIDATED

Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leifer, Superintendent. Divided into 300,000 shares at \$1 each. Property comprises two locations. Ore assays \$7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide. Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

California Inventors

Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patent and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. FOR SALE.

The Empire Foundry and Machine Shop in the city of Marysville, now and for many years doing a remunerative business, is offered for sale at less than half its value. Everything as it stands—stock, machines, patterns, real estate, etc., will be sold on easy terms. A first-rate opportunity for establishing an agricultural implement manufactory as an adjunct. This is the only foundry and machine shop in the neighborhood.

For further particulars address

R. HOSKIN, Marysville.

S. E. corner Pine, - - San Francisco

THE VICTOR CONCENTRATOR,

Having passed the experimental stage, is now offered to the consideration of the mining public, in full confidence that it will meet satisfactorily all reasonable requirements. In operation it is unlike any other machine of its class. The concave disc having a rotary reciprocal motion, causing the waste sands to flow over its periphery continuously, while the sulphurets are also drawn continuously through its center, the whole process being automatic and complete. The Bater in the hands of an expert is known to be the nearest to perfection for concentration. This is the principle upon which this machine works. The advantages gained are:

1. Greater capacity with more perfect work.
2. Simplicity of construction and management.
3. When used as an amalgamator it has no equal.
4. The first cost is less than other machines of much less capacity.
5. The shipping weight is less than 1000 pounds.

Mine owners and millmen are invited to carefully examine the Victor before deciding upon their concentrating works. Address

S. W. SHAW, or N. W. SPAULDING,
17 and 19 Fremont Street, SAN FRANCISCO.

ARE YOU GOING

TO PUT UP MACHINERY OF ANY KIND?

TO MAKE ANY CHANGE IN MACHINERY

ARE YOU FREIGHTING BY TEAM OR PACKING ON MULES?

DO YOU WANT PULLEYS ON SHAFING ALREADY UP?

If so, don't fail to look into the merits of

THE DODGE PATENT INDEPENDENCE WOOD SEPARABLE Or SPLIT PULLEYS.

They are the Lightest, Strongest, Best Balanced and Most Convenient Pulleys Made in the World. Entirely New and Original.

Adapted to any power required. Time, trouble and money saved by using these pulleys. Price List and Catalogues mailed free.

\$1,000 CHALLENGE!

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS (\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

698 Broadway, New York

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish Single-Jointed Giants when required. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent on application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

HOSKIN'S

IMPROVED

ONE-JOINTED

HYDRAULIC MACHINE.

The statement of Mr. Joshua Hendy that any style of machine is an infringement on any style manufactured by him, he knows to be absolutely false. The Supreme Court of the United States on March 19th decreed that the pretended patent for infringing, which he has for years been fleecing miners for royalty, is ABSOLUTELY VOID, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. R. HOSKIN, Empire Foundry, Marysville, Cal.

SQUARE FLAX PACKING,

Manufactured from strictly first class Flax and pure lubricants. Superior to all others for Water and Steam. Packs with less friction and makes a tighter joint than any other packing made. All imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center of its entire length. See that you get it and take no other. Sold by all Hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

California Inventors

Should consult DEWEY & CO., AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors for better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 220 Market St., San Francisco Elevator, 12 Front St.

New Almaden Quicksilver.

J. B. RANDOL,

Room 22, 320 Sansome St., San Francisco.

BRYAN'S ROLLER QUARTZ MILL,

The most perfect Roller Mill made, for the following reasons:

1. It is cheaper.
2. It is more durable.
3. It crushes a larger amount of ore with less power.
4. It amalgamates a larger percentage of the gold.
5. Its "clean-up" is quicker and fuller.
6. It is portable, requires no frame-work, and is ready for the foundation as it leaves the shop.

Full Descriptive Circulars of any of the above sent on application.

of Tyres will crush 1500 tons. One ring plate will crush from 2200 to 2300. The mills require very little attention. At our mill an ordinary "peon" earning one dollar per day has complete charge. In regard to slitting, in comparison with stamps by reason of the discharge surface and the continuous agitation by the scrapers, a much less amount of slimes is created. A three years' experience teaches me that, in every respect, the mills are a complete success and of material benefit to the mining world. They can be set up and running in 48 hours, and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator, it is unequalled by any mill now in existence.

Yours truly,

D. M. BURNS, Superintendent

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
 SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

Risdon Iron Works, San Francisco—GENTLEMEN: Our Company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screen 12 tons in twenty-four hours; through 50-mesh, 15 tons; and through 40-mesh, 18 tons. This proportion has been continuous. One set of Dies will crush from 1500 to 1600 tons. One set

 New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES, THE GREATEST ROCK CRUSHER ON EARTH!

WHAT IS SAID OF IT BY ONE WHO HAS USED IT THREE YEARS.

OFFICE OF ERNEST L. RANSOME, MANUFACTURER OF ARTIFICIAL STONE AND CONCRETE,
 No. 508 CALIFORNIA STREET, SAN FRANCISCO, November 9, 1888.

Pacific Iron Works—GENTLEMEN: In answer to your request for my experience with the Gates Crusher would say, that I have used one for the past three years crushing trap rock, basalt and granite for making concrete, the most of it being very hard and calculated to test severely the strength and durability of any machine.

I have crushed in that time probably not less than 10,000 tons of this material, without any repair being necessary, and without any change of shoes and dies, and, as far as I can judge, they appear to be good for as much more service.

I have had more or less experience with nearly every crusher in the market, and regard the Gates as infinitely superior to them all. In fact its efficiency, durability and capacity for work is simply wonderful. For crushing all kinds of ore, ballast or macadam—fine or coarse—nothing can compare with it. You are at liberty to refer any parties to me who may want further evidence as to the merits of this remarkable machine. Very truly yours,

ERNEST L. RANSOME.

Jewell's Patent Water Purifiers.

The subject of water purification is of such vital importance to every man, woman and child, that it claims the earnest attention not only of the sanitarian, but of the entire public. All are interested in and anxiously awaiting the successful solution of this problem.

It is not within the scope of this article to relate the history of the efforts which have been made by scientists to produce pure water; it is, however, deemed proper to present certain facts demonstrating what has been accomplished, and proving that a "Pure-Water System" has been devised, and that by its use the problem has been solved in a practical manner, upon a scale of any magnitude, and at a minimum cost of construction and maintenance.

The construction of the filter, which is illustrated on this page, is such that the valve-system is connected to the side of the filter, which places the valves conveniently within easy reach of the attending engineer. These filters are so constructed that they can be connected to deliver the purified water on either the right or left side, as may be required.

There are simply three connections to be made: One to introduce impure water, one to discharge the purified water, and the third to discharge the wash-water. In this system the main arms are made of extra strong pipe, while all of the lateral arms and their branches are heavy brass tubing with brass fittings leading to the patented brass sand cone valves, by the use of which the attendant is enabled to reverse the currents of water in the filter, thoroughly cleansing the sand of all impurities in an exceedingly short period of time; and the construction is such that during this operation there is no possibility that the filtering material can be washed out. These cone valves are automatic and positive in action, and it is a mechanical impossibility for them to become inoperative, as they open and close only by the water used in cleansing the filter. The outlet apparatus is fitted with an aluminum bronze screen, which cannot corrode, and the tensile strength of which is greater than that of steel. While the filter is being washed a separate current is forced in a reverse direction through this apparatus, thus insuring its perfect cleansing.

In purifying water, whether for potable, domestic or mechanical uses, it has been found to be absolutely necessary to use a coagulating substance to collect the impurities in order that they may be arrested and removed by the filter.

To accomplish this necessary feature a sight-feed pressure and vacuum chemical apparatus have been devised, which are shown in Figs. 2 and 3, herewith illustrated, the former, No. 2, being used when the filter is connected to a supply-pipe under pressure, such as a city main or reservoir, and the latter, No. 3, when the water is supplied by a pump.

Both of these devices are automatic and positive in action, allowing only a fixed quantity of chemical to pass into the water while the filter is in operation, and when the filter is shut off the flow of chemical ceases, thus preventing its waste. Opening the valves of the filter will cause either apparatus to work automatically. The "pressure tank" is attached by cutting out a short section of the vertical supply pipe and inserting the apparatus. The pressure of the water passing through the tank will cause the chemical to be forced into the supply pipe, where the desired chemical change in the im-

purities contained in the water will have occasioned. The "vacuum tank" is connected to the suction pipe, or into the suction head of the pump.

In operation, every stroke of the pump causes a fixed quantity of the coagulant to pass into the suction pipe, and thence through the pump,

can be attached to one filter; and when properly regulated there will not be found a trace of the chemical used for the coagulant in the purified water delivered from the filters.

The chemicals used in this pure-water system form new combinations with the impurities contained in the water and are precipitated and

established where analyses of waters will be made, without charge, to determine the treatment requisite for its purification. In order to insure an accurate analysis, it is important that not less than two gallons of the water shall be forwarded, and that such sample shall be sent in glass and carefully corked and sealed. A copy of the analysis will be promptly furnished and the necessary treatment recommended, and, if proper, a guarantee be given.

The claims which are set forth for the "Jewell" pure-water system are: First, absolute perfection in purifying and softening waters; second, simplicity of system; third, quickness in cleaning; fourth, positive assurance that filter bed is perfectly clean after each washing; fifth, durability—no springs or complicated valves to be soon worn out; sixth, strength in construction of all parts; seventh, steady and regular feeding of the coagulating or precipitating chemical.

Many testimonials are at hand demonstrative of the peculiar merits of this pure-water system. Among them is one from the Calumet and Hecla Mining Co., which has been using

FIG. 1.—THE JEWELL WATER PURIFIER.

where, it becomes intimately intermixed with the water, thereby producing a perfect aggregation or coagulation of the impurities contained in the water. Inside of the tank a ball cock is placed which controls the flow of water and retained in the filter-bed and passed off when the filter is washed.

Organic and other matter can sometimes be removed by the intimate intermingling of air with the water in its passage to the filter, the

FIG. 3.—VACUUM CHEMICAL TANK.

automatically supplies the necessary quantity to replace that which is drawn out by the pump, and prevents any overflow or waste of the chemical. This tank is open at its top, and the quantity of chemical being used can be noted and replenished when required.

By either of these methods, the desired quantity of coagulant can be fed with absolute correctness, and, when necessary, two or more tanks

oxygen of the air tending to destroy the germs and organic impurities, which then pass to the filter and are retained in the sand. Water that has been thoroughly aerated, especially under pressure, and then filtered, is as free from dangerous matter and as near perfectly potable as can be obtained.

In connection with the manufacture of these purifiers, a fully equipped laboratory has been

FIG. 2.—PRESSURE CHEMICAL TANK.

two of the Jewell filters for filtering the mine water for use in boilers. They have very much improved a very filthy water, and enabled the company to use it for feed, a thing for which it was before entirely unfit.

The Joshua Hendy Machine Works of Nos. 39 to 51 Fremont street are the agents for the sale of these purifiers, and those who are in favor of using pure water, whether for domestic or mechanical purposes, should send to them for catalogues illustrative and descriptive of this system.

MINE FIRE.—A fire has broken out in the Calumet No. 3 shaft of the Calumet and Hecla copper mines, Lake Superior. It was only a few months since that a fire in these mines was extinguished which had been burning many months. It is expected that the new fire will have some effect on the copper market, these mines being among the largest producers in the United States.

DIVIDENDS were paid in this city by mining companies in November to the amount of \$264,250.

CORRESPONDENCE.

We admit, unadvised, opinions of correspondents.—Eds.

The Mines of Plumas, Sierra and Nevada Counties.

EDITORS PRESS:—On a recent tour of the important mining districts embraced within Plumas, Sierra and Nevada counties, I jotted down some notes that I thought would perhaps be worthy of a space in your journal. Taken all in all, there is not probably a more interesting region on the Pacific Slope. Here may be seen, nestled amid lofty mountains, the most beautiful valleys of greater or less size, the fertility of which can scarcely be excelled anywhere; but it is of the mining enterprises that I wish particularly to speak.

The Greenville District.

Once the liveliest in Plumas county, is now, owing to legal difficulties and mismanagement of some of the important mines, quite dull. There is, however, an exceedingly bright outlook, and a revival of its former prosperity is but the question of a very few years at farthest. All agree that the mineral is here, and only needs more capital and well-directed energy to bring it to the surface. The faith of old times is shown on every hand by the works. A number who have made considerable money here are using it freely in developing claims that promise rich returns. One of the highest enterprises here is the

Round Valley Reservoir

And water-works, owned by Messrs. McGill & Bidwell. The reservoir is at an elevation of 800 feet above Indian valley. Its construction was commenced in 1868, and up to this date represents a cost of over \$100,000. Its purpose is to supply the mines of the district with the necessary water. Those dependant upon the reservoir are the Johnny Ball, Drury, Pacific, Forest King, the Cherokee group, Round Valley Consolidated, New York, Plumas Con., O'Tool & Summit, McLellan claims, Green Mountain and others. The company have eight miles of ditch for the distribution of the water, on the line of which is an inverted siphon composed of 5000 feet of 22-inch pipe crossing a canyon under a pressure of 400 feet. The company make their basis of rates for water furnished on 50 per cent of cost of steam-power, including the water used for battery purposes. This estimate is made with the assumption that both plants are on the ground. Thus, while furnishing the company with a handsome revenue, the mines are supplied at an exceedingly low cost. As high as \$1400 per month has been realized by the company from the water. Owing to tight winters for the past two years, the supply of water, which depends upon snow and rain, has been short and the company has been unable to supply the demand. They have hopes to secure a good supply this season. The dam proper is 300 feet long and 25 feet in height, constructed with a rock wall in center and loose dirt on sides. It is the most natural site for a reservoir imaginable, and its location is quite picturesque. It covers 800 acres and will hold an average depth of 15 feet of water, and has a watershed of 40 square miles. An item of no small moment is the fact that it is surrounded by miles and miles of the best timber in the State, from which must ere long spring a lumbering industry of great magnitude. Then will this great water storage be of utility in furnishing the power to run the mills that will be called into operation by lumbermen, after which it may be conducted to the fertile lands of Indian valley for irrigation.

Promising Mines.

One of the most promising mines of this district, about which little has been said, is the Drury, owned by a gentleman of that name. Tunnel No. 2 is now in over 450 feet; they are still driving ahead, and taking out quartz (free milling) which assays an average of \$20 per ton. From an extra vein lately discovered Mr. Drury extracted 50 pounds of ore, which, after retorting, yielded nine ounces of pure gold.

The Crescent mine—J. W. Whitney, superintendent—is still paying well. Two and a half millions is said to have been taken from this mine since its discovery in 1860. Capt. J. McDonald of your city is the fortunate owner.

The Green Mountain suspended operations about one year ago on account of financial embarrassments and lack of water. It is an extensive mine and has a 60-stamp mill. Mr. C. G. Rogers, the superintendent for the last 13 years, informs me that it is expected to resume operations next spring. What mines exist in the neighborhood of Quincy, the county seat of Plumas, seem to be entirely at rest, and, in consequence, a decidedly rural quietude reigns over the town. The Meadow Valley district is also taking a kip Van Winkle snooze. However, I was informed by Mr. Kellogg of the firm of Kellogg & Thompson that prospects are brightening. The Butterfly (gravel mine) has a tunnel of 300 feet and is pushing ahead steadily. A number of placer mines between Quincy and Spanish Ranch pay big when water can be had for mining purposes.

The Consigne mine at the mouth of Jamison creek has a tunnel in 500 feet and contract let for 1500 more. At this distance, 2000 feet, it is expected to strike the channel. It is owned by a Pittsburg, Pa., company, and their operations may be regarded solely in the light of prospecting. They have already in the past 10 years ex-

pended over \$60,000 in their venture in this district, with slight returns.

The Shenandoah quartz mine, located in the neighborhood of Rich Bar, east branch of Feather river, promises to become one of the best mines in the district. The proprietor, F. B. Whiting, has unlimited confidence in its future. From a pocket vein he informs me that he took a quantity of ore this season that yielded \$200 to the pond.

The Plumas Eureka mine and mill, Johnville, superintended by John Hoskins, seems to yield as good returns as ever. The company employ 215 men and average 4600 tons of ore crushing monthly.

Along the Jamison creek below Johnville the Italians operate 29 arastras in working over the tailings from the Eureka mill. They pay a royalty of \$1 per day for each arastra, and are said to be doing well. Some of these operators are known to have left for Italy recently with from \$10,000 to \$30,000 as the result of their labors here.

The Four Hills mine, closed down four years ago, has not resumed operations yet.

The Gold Lake mine, 10 miles south of Johnville, owned by the Gold Lake M. Co., of which M. Willoughby is president and W. B. Mathews is secretary, will undoubtedly prove excellent property. The prospects are so encouraging that the company are planning to erect a mill next spring.

Around Sierra City.

The mining enterprises around Sierra City, Sierra county, are generally in a prosperous condition, and the business-men of the town profess to be much encouraged by reason of the bright outlook for the next year. There are a number of new mines just about ready to start up, among which is the Boffalo Consolidated, eight miles south of the town. Mr. E. Bosch, the superintendent, states that he has over 1000 tons of ore on the dump. The mill machinery has been delivered, and a commodious boarding-house and blacksmith shop erected for use of the mine. The ledge throughout the mine averages over 15 feet. The ore is finely decomposed and carries coarse gold. Three tunnels have been started. No. 1 is in 350 feet; No. 2 is in 200 feet, and No. 3, south side of creek, 60 feet. The latter will be extended 500 feet, upon which Mr. Bosch thinks that the main body of rich ore will be tapped. The stock of this company is divided into 600,000 shares at \$1. Doubtless this property will prove a bonanza to the stockholders.

The California Consolidated Gold Mining Co. has a mine adjacent to the town, the ore of which assays an average of \$7 per ton. A. Schubert is president of the company and Alvin Fischer is the secretary. The ore yields coarse gold. Lack of available capital has retarded the operations of the company. Tunnel No. 1 is in 120 feet, and the second tunnel just commenced. The vein is from 15 inches to 2 feet wide. Considering the quality of the ore and the convenience of the location, it is difficult to conclude otherwise than that this property will also eventually rank with the rich investments in mining enterprises.

The Morris Concentrating Apparatus.

The Margarite mine is now under the efficient management of Frederick Morris, the inventor and patentee of the Morris concentrating apparatus. It is the intention to have everything ready to begin active mining operations at an early day. New machinery has been introduced and placed in order. I was much interested in Mr. Morris' concentrating apparatus. He has received many high testimonials from the leading mining-men throughout the coast. By this process gold can be concentrated from the sulphurets with one operation by finely crushing the ore. Mr. Morris took a contract from the Excelsior M. Co., Meadow Lake district, some time since, to extract 73 per cent of gold from base sulphureted ore, and succeeded in working it up to 97 per cent without roasting, simply by ordinary milling. This process is adopted by the Young America below their mill. It has been adopted in three mills of Amador county, and since the fact has become known of its extraordinary success, Mr. Morris has received applications from numerous quarters, even so far away as Butte, M. T.

The Young America.

The fame of the Young America is now too well established to require special mention. I was informed by Mr. A. C. Busch, the superintendent, that there was actually enough ore in sight to keep the mill employed day and night for the next 15 years. The company runs three eight-hour shifts, furnishing employment to over 150 men. The wages paid are \$2 per day and board. The mill is a 40-stamp. Tunnel No. 4 has been lately started with the intention of doing away with the tramway. It is expected to strike the vein at a depth of 2300 feet from summit. Ingersoll drills are employed in the prosecution of the work.

The Sierra Butte mine, Thos. Preston superintendent, employs the usual large force of men with about the same results as the preceding season.

The Downieville Mining District.

Once so famous for its placers, seems likely to loom up in the not far distant future as a rich quartz region. Through the courtesy of Dr. Biher I was furnished a saddle-horse and accompanied him up the old Sacramento stage-road to the top of Mt. Vernon Hill, altitude 6400 feet above the sea. From this eminence the doctor pointed out all the noted landmarks

in every direction, and recited the history, or perhaps the traditions, connected therewith, with which he seemed perfectly familiar. Space forbids a recapitulation of the interesting notes taken on that occasion.

The Oxford mine prospects well. This is an old mine situated one mile north of Downieville, and superintended by H. H. Purdy. The company under a new incorporation have commenced a tunnel 300 feet below the old tunnel, and are in hopes of striking the ledge within 50 feet. The ore in the upper works averaged from \$12 to \$20 per ton.

The Homestake, five miles south, S. Spencer superintendent, is ready to begin operations. The quartz is of a high grade. The mill has eight stamps, and ten men are employed about the works.

Good prospects are reported from the Hog Canyon district; 25 pounds average rock taken from the Superior yielded \$3.65. So says Geo. McGee, the proprietor.

There are also some paying placer mines still around Downieville. The best gravel mine that came under my observation was the Wide Awake, nine miles north. In fact it was freely acknowledged as the best mine of the kind in the country. It is located in a comparatively new district. The company employs 13 men and the work is superintended by John Wilsdorf. Active operations were only started two years ago, though the company has been incorporated for the past four years. The capital stock is divided into 24,000 shares, originally estimated at \$1, but at present, so profitable has the investment proved, the shares are worth \$4 each. The ore yields \$4 75 per carload. The heaviest shareholders are residents of Downieville.

Nevada City.

Few places of note show stronger evidences of the lively times that have been, but long since departed, than Nevada City, Nevada county. We do not have to look far for the cause. It has in the past been practically a placer and hydraulic camp, and since the former has played out and the latter prohibited by law, its great dependence is gone. It must now eke out an existence in the best way possible. Nevada City still has the county seat, which is some help, but not sufficient to keep it up. There are a few quartz mines near by, but they do not seem to be doing much. It is to be hoped that some rich discovery will yet reward the persevering efforts of the prospector in this locality, and revive business once more. The old Mexican veteran, Capt. J. D. Flemming, one of the sturdy pioneers of '50, in partnership with Jos. Floyd, has lately commenced the opening of the Hard Tunnel mine at a new point. An attempt to open this ledge was made in '51, but owing to the hardness of the rock the experiment was abandoned, but from this circumstance the mine took its name, Hard Tunnel. Hoisting works, once located on this vein, near the present depot site, were accidentally burned down in '59. Many old friends would be glad to hear of the captain's good fortune.

Grass Valley

Has several mines that rank as old and reliable standbys; as for instance the Idaho, Empire and North Star. The former, superintended by E. Coleman, still pays its usual large dividends. The Empire, G. W. Starr, superintendent, is forging ahead as of yore, giving employment to 150 men, and furnishing satisfactory evidence that the ledge will hold out for a number of years yet. It is seldom that an employee of a mining company (or in fact of any other company) can assert truthfully that he has served in the same capacity continuously one company for 24 years. Such a man, however, is Matthew Provines, the amalgamator at this mine. He has served under eight different administrations, among whom were the well-known Capt. Lee and Jim Wilcox. Mr. Provines' wages at this mine have amounted to \$35,000 during the quarter of a century.

The North Star mine, Emile R. Abadie, superintendent, employs 200 men at present. The average assay of the ore now being taken out is estimated at from \$15 to \$25 per ton.

The Pittsburg mine, situated three miles north of Grass Valley, was formerly known as the Wigham mine, and was first worked in '52. The treasure taken from it first and last would foot up into several hundred thousand dollars. The mine was purchased by the present owners (an English company), last June, and is now being supplied with new machinery of the most improved order. Under the superintendence of M. L. Elliot, a new 10 stamp mill is being erected, and when completed, it is believed, will rank with the first on the coast. One thousand-pound stamps, Frue concentrators, sectional Blake crushers, and 200 square feet of new plates will be employed in the construction of the mill. Only 20 men are at present employed, but the force will be increased soon. They are doing development work at present. The ore that is preserved assays from \$15 to \$30 per ton. The shaft has been sunk to a depth of 1020 feet.

The Rock Bar mine on New York hill, two miles south of town, just between the Massachusetts mine and the North Star, has hoisting works on the south shaft, which is now down 500 feet.

The Chavanne shaft (same ledge) is down about the same depth. The chief owner and superintendent, Mr. H. Sylvestre, employs 15 men, and regards his present operations as merely development work and is very well satisfied that the ore taken out fully pays all run-

ning expenses. The Rock Bar mine embraces the Ford and Mellen claims, well known in earlier days as exceedingly rich; \$300,000 having been taken from about 300 square feet. Altogether Mr. Sylvestre reckons that at least one and a half millions have been extracted from this mine. Six years ago the present company took out \$20,000 in less than five days from a space of 20x30 feet. The average assay of rock taken out at present yields \$35—45 per cent sulphurets.

The Maryland property, adjoining the Idaho, which latter has paid such large dividends for many years, is highly spoken of by expert miners. For hundreds of feet the Idaho company has worked the ledge up to the Maryland line, and the fact that the Idaho produces \$600,000 a year is sufficient to indicate the character of the ore. There is insight in the Maryland mine, viewing it from the Idaho workings, enough ore to keep a 40-stamp mill running day and night for 20 years. Mr. S. P. Dorsey, the owner of this property, is satisfied that it is a good thing to have, and would not exchange it for less than a million dollars.

Not the least worthy of notice are the iron mines in the west end of this county. Mr. M. C. Taylor, the owner of 4500 feet of a 60 foot ledge, estimates that there is enough ore in the vein to run a 25-ton furnace for 30 years. It is a red and brown hematite and averages 60 per cent iron. These mines will doubtless in future prove a source of great wealth to Nevada county. F. B. L.

Bodie Tunnel.

EDITORS PRESS:—A few weeks ago I had the opportunity of making an experimental run with ore from the Bodie Tunnel mine, the results of which were so satisfactory that I publish them for the benefit of the stockholders of the company.

If reports are true as to the quantity of ore in the mine, there is no reason why the company could not begin to pay small dividends which could be increased by enlarging the crushing capacity of the mill. The property has been idle for a long time and probably the stockholders have long ago given up the hope of ever seeing any return for their investment. Instead of being a legitimate mining enterprise it has become an assessment property subject to the fluctuations of the stock-board. Prominent millmen have made several attempts to work the ore, but their efforts resulted in signal failure, whereas, had they been less conservative they would have been successful. The experimental run was made at the miner's mill which had been leased by the Standard Co. for the purpose of making experiments with the "Brewster Centrifugal Amalgamator." I made very exhaustive tests with this machine and found that it possesses none of the merits claimed for it. It is not a concentrator; it does lose quicksilver; and the pulp does not pass through the quicksilver. It possesses no advantage over copper plates, but the disadvantage of costing more and requiring power to run it. As I had unusual facilities for testing this machine, I will publish the results at an early date.

Bodie-Tunnel ore contains some coarse gold which would be saved in the battery; but this was not allowed for in the following results. The average of many assays indicates that the ore marked was of poorer grade than the average in the mine.

The ore was crushed through a No. 40 steel-wire cloth, the pulp run over amalgamated copper plates and the tailings amalgamated by charges in pans, with the addition of one pound of bluestone and 2½ pounds of salt to the charge. Amount of ore worked, 29 tons; less 8.7 per cent moisture, 26 48 tons; value of ore per ton, \$8.22.

Bullion Results.

Value of bar obtained from copper plates, \$148 31; extraction=\$5.60 per ton, or 68.1 per cent; value of bar obtained from pan amalgamation of tailings from copper plates, \$47.88; extraction=\$1 81 per ton, or 22 per cent; total extraction=\$7.41 per ton, or 90.1 per cent.

The copper plates were too short and I think that by repeating the experiment with longer ones the plate extraction could be increased to 75 per cent. I have no doubt that the extraction could be further increased from five to ten per cent by passing the tailings from the plates over suitable concentrators such as the Frue or Triumph, thus doing away with expensive pan amalgamation.

Cost of working 30 tons of ore per day at the Bodie Tunnel mill, using copper plates and concentrators, would be approximately as follows: Labor 2 engineers at \$5, \$10; 2 battery feeders at \$4, \$8; 2 concentrators at \$4, \$8, \$26; fuel, 4½ cords at \$10, \$45; castings, lubricants, etc., at 50 cts. per ton, \$15; contingent expenses, \$4; total, \$90. Cost of milling per ton, \$3.

By increasing the crushing capacity of the mill, the cost of milling would be reduced.

The theory has been advanced that ore from the Bodie district could not be concentrated, but several months' experience has convinced me to the contrary. If such companies as the Standard and Bodie Tunnel would discard their expensive pans and introduce copper plates and concentrators, the cost of milling would be much reduced, the extraction increased, and new life infused into what is now a dead mining camp.

Geo. J. ROCKWELL,
Lste Mill Supt, Standard M. Co.
San Francisco, Nov. 26, 1888.

The Lixivation of Silver Ores with Hyposulphite Solutions.

NUMBER 2.

EDITORS PRESS:—Continuing my examination of Mr. Stetefeldt's book, I note that on page 75, comparing the economy of sodium and calcium polysulphide, the author, after showing that, as is well known, thiosulphate is formed in making the polysulphides, says: "A solution of calcium hypsulphite, on the contrary, decomposes rapidly into gypsum and sulphur if heated above 60° C. or 140° F." This he supposes to involve a loss of sulphur which does not occur in making the sodium compound, owing to the greater stability of sodium thiosulphate, which remains intact to reinforce the stock hypo, as metallurgists have supposed to be the case also with calcium. He goes on to say: "From this it follows that, in preparing the calcium solution, most of the calcium hypsulphite formed is again decomposed, and that in its place calcium sulphate is obtained." Here is a doable error: In the first place, when calcium thiosulphate in aqueous solution is decomposed by heat, not sulphate is formed, but sulphite. In the second place, the decomposition does not occur in presence of a strong solution of polysulphide. Freshly made solution of calcium polysulphide contains a large proportion of hypo, and the quantity does not diminish, but increases by continued boiling.

I took two equal volumes of calcium polysulphide solution; the one was immediately decomposed by a solution of zinc sulphate, filtered, and the precipitates well washed, with the aid of the filter pump; a portion of the filtrate corresponding to 1 c. c. of the original liquid contained a quantity of thiosulphate represented by 28. The other was boiled for an hour, then treated in the same way as the first. It contained a quantity of thiosulphate represented by 30 for each c. c. of the original liquid. Other experiments confirmed these results. Thus another portion of the "sound basis" crumbles away, and one of the objections recently raised against the Kiss process falls to the ground, while practical metallurgists, who well know that they rarely have occasion for reinforcement of their hypo, are vindicated in the belief in which they have worked.

It is true, nevertheless, that calcium involves the use, not necessarily the loss, of a larger quantity of sulphur than where sodium is employed. In either case there is always free sulphur in the precipitate, and there are three ways in which that sulphur may be recovered: Firstly, where good lime can be got by boiling the precipitate with milk of lime; secondly, by boiling it with caustic-soda solution; in these cases polysulphide is recovered; thirdly, by warming it in solution of sodium sulphite, which dissolves the sulphur and forms hypo. The figures given on page 86, showing a consumption of 21.6 pounds of lime and 9.3 pounds of sulphur per ton of ore, as against 4.4 and 2.9 pounds of soda and sulphur per ton of similar ore, are the veriest claptrap, more worthy of a quack medicine advertisement than of a serious treatise. If true, they only show the extremely bad quality of the lime, the poor quality of the work, or both together. I am disposed in favor of sodium sulphide, where it is not too expensive; but such arguments as these are worse than hugging the question.

Speaking of neutralizing caustic in the (sodium) hypo by means of sodium bicarbonate, on page 27, the author says: "Besides, it is not practicable to perceive * * whether the caustic is neutralized or not, since the reagent itself has an alkaline reaction. Hence the bicarbonate has to be added at random." In the next paragraph he goes on to say: "If the lixiviation solution contains calcium, derived either from caustic lime or calcium sulphate in the ore, or from using calcium sulphide as precipitant, it becomes possible to ascertain the end of the reaction. From a sufficiently diluted solution, sodium bicarbonate does not precipitate calcium, the bicarbonate of the latter element being soluble in water. If, however, caustic soda is present, which converts the sodium bicarbonate into the neutral salt, calcium carbonate will be precipitated as long as caustic soda remains to be neutralized."

Now, if this is true (and it is), why must the bicarbonate be added at random? What is easier than, by the aid of a solution of calcium chloride, to make an assay of the stock hypo, showing the exact proportion of bicarbonate required? or, in a similar manner, a qualitative test may be made at any time during the progress of the neutralizing, showing whether or not it is completed.

But on page 33 we are informed, no doubt correctly, that "caustic lime dissolves in sodium hypsulphite solution, a double salt of sodium and calcium hypsulphite and free caustic soda being formed." Hence, then, if the caustic soda in the hypo is produced by lime, from whatever source, the soda and lime are present in equivalent proportions, and all that is necessary is to add the bicarbonate as long as it causes a precipitate. If, however, the caustic comes from sodium polysulphide being used as precipitant, the test with calcium chloride may be resorted to.

This brings me to a consideration of the probability of the hypo becoming caustic from the use of calcium polysulphide. I have taken solution of the calcium salt and added zinc sulphate solution; in every trial, all alkalinity that could be detected by litmus paper disap-

peared as soon as the polysulphide was decomposed. The same result was obtained when the sulphide solution had been reboiled with freshly slaked lime, and the same when, instead of zinc sulphate, sodium-cuprous thiosulphate, neutralized with potassium hydrate, was used. All of these experiments, however, seemed open to cavil, if not to positive objection. I therefore made a strong solution of silver in sodium hypo, and, dividing it into two parts, precipitated the silver from the one by ordinary calcium polysulphide, and from the other by that which had been reboiled with slaked lime. In neither case did the liquid show alkalinity to litmus or turmeric paper. I conclude that it is very doubtful, to say the least, if the hypo ever becomes caustic from the use of calcium sulphide. This is a point in favor of the Kiss process, and it helps to account for the fact that workers of that process have seldom been troubled with caustic in their solutions, which seems to be such a bugbear to the Russell process folk.

In working the Kiss process, however, as generally conducted at least, there is always a possibility of the hypo becoming caustic if the ore is calcareous, for even though calcium hydrate may be insoluble in calcium hypo, yet there is usually some sodium salt present, from the fact that the work is always commenced with sodium hypo, and it must take a long time to work all of that out, to say nothing of an occasional reinforcement of the hypo by an addition of sodium thiosulphate, and the possibility of the roasting salt not being entirely removed by the washing. In my next I may have something to say about different methods of neutralizing a caustic hypo and some other matters.

I think I have shown that he who would study the theory and practice of leaching silver ores will do well to take the book in question *cum grano salis*. As to the practice, from the Russell point of view at least, Mr. Daggett has generously given it to the world free of charge, and this being the case, that gentleman is excusable if he has allowed his book to assume somewhat of an *ex-parte* character.

I cannot, however, quite understand why the promoters of Russell's modifications insist so strongly on applying them to the Patena process only. I think this produces a prejudice in the minds of some, and I have no doubt many people have an impression that Russell's improvements cannot be applied to the Kiss process; this is wrong, except in the matter of precipitating lead by sodium carbonate, which is not always necessary or desirable. Or is it that the cases are so few in which, with good roasting, and the use of calcium polysulphide, thus avoiding causticity, unless in case of a calcareous ore, the Russell process offers sufficient advantages to offset the increased trouble and expense?

C. H. AARON.

The New Source for Chlorine Gas.

A Hint for California Salt Manufacturers.

At the meeting of the California Academy of Sciences of Nov. 19th, Mr. T. Gutzkow spoke on the proper manner of making Sorel's cement or magnesium oxychloride produced by mixing calcined magnesite with a solution of magnesium chloride. He pointed out that this cement is the only substitute for plaster of paris yet discovered which equals it in whiteness and delicacy of imprints and surpasses it greatly in hardness, compactness and resistance against water. At the present time, however, this magnesium oxychloride is also in another respect of great interest, to wit, as a source of chlorine gas. Mr. Gutzkow referred to that point in his lecture as follows:

Interest in chemical industry is, for obvious reasons, so small on this coast, that many members will learn for the first time that for about 10 years a fierce war has been raging in that important source of English prosperity, the alkali trade; that is, the soda manufacture. At that time there appeared on English soil as a foreign importation a neglected child of England, the ammonia-soda process, invented in 1836 by John Thom of Manchester, and boldly challenged the old Leblanc soda process for competition. The competitor, at first contemptuously received, became soon a dangerous rival, with very strong chances for final victory. While the ammonia process starts from a saturated solution of salt, and uses only limestone as second material, the ammonia being used over and over again, the Leblanc process requires the dry salt, and in addition to limestone, sulphuric acid, obtaining as a by-product muriatic acid, which costs 36 per cent of the whole process.

As a stronghold of the old process unassailable by the new one, it was formerly considered that the ammonia-soda process did not furnish material for making chlorine for bleaching powder. This substance is the most important by-product of the Leblanc process and is manufactured in England every year to the value of \$5,000,000, of which the larger half is exported. England has nearly a monopoly on that compound since Weldon, in inventing the well-known process of reviving manganese, made England independent of that mineral, previously imported from abroad. For some years English soda manufacturers have derived no profit from the sale of their soda and look for the income to bleaching powder, a "trust" in that material having been formed.

Now, there occurred a memorable event in the history of chemistry at the end of last year, namely, at the December meeting of the London section of the English Society for Chemical In-

dustry, the president of the society, Prof. Dewar of Cambridge, read a paper which gave the results of working at a large scale at Salindres, in Southern France, on the establishment of Mr. Perhiney, a new process for obtaining chlorine. This process consists in passing, at a red heat, a current of air through the very substance I have been speaking about, that is, through magnesium oxychloride. The results were highly favorable, with all prospects that they will be improved. They could not be doubted, for Prof. Dewar, who is a chemist of the highest standing in England, had personally and closely watched the process at Salindres. Mr. Perhiney himself is a man of national reputation in France, and his apparatus have commanded the admiration of all chemists.

The magnesium oxychloride is prepared by dissolving magnesite in muriatic acid, mixing this solution with magnesite, drying the cement at 300° C. to free it from water, and dumping it into an oven. This oven consists of nine chambers, each nine feet high, three feet long, and three inches wide, and is heated by gaseous fuel. When the required temperature has been reached, the whole gas generator plant, which rests on wheels, is moved away slightly so that the oven may be closed by hinged doors; an exhaustor is set in motion and a current of air drawn through the oxychloride, which, having absorbed the heat from the brick walls of the furnace, has become red hot. The gases cooled are first muriatic acid and then chlorine. The former is condensed in a much-adorned chamber by glass tubes, through which water passes and the chlorine conducted to the lime-absorbers. The residue in the oven is magnesite, which is again used with the condensed muriatic acid and with a certain amount of fresh acid for making the oxychloride. Thus the muriatic acid yields 80 per cent of its chlorine, while by the old Weldon process it has not been possible to utilize more than 33 per cent of it.

This would of itself be a great advantage, but there is still another circumstance to be considered, much more in favor of the new process. This is, that no muriatic acid is required. It is intended to employ—and there is no doubt that this is feasible—the concentrated solution of magnesium chloride which Mr. Perhiney obtains as a heretofore valueless by-product from his large sea-salt works, situated at the mouth of the Rhone, the largest works of that kind in existence.

I have given a description of these celebrated works in one of the late numbers of the Transactions of the Technical Society of this city. I have stated in that paper that the conditions for salt-making are much more favorable in California than in France; that even now the yield of salt per acre is much larger here than there, and could be made fully twice as much if our salt-makers would adopt the much cheaper French method. There is now running into the bay every year about 20,000 tons of dry magnesium chloride in 3,000,000 cubic feet of hibern, nearly enough to make all the bleaching powder exported from England. Nor is there any limit to the quantity we may produce. Neither the concentrated solution of salt for soda-making by the ammonia process nor the solution of magnesium chloride for chlorine-making by the Perhiney process will cost much more than the interest on the capital invested in making the levees.

It was prophesied a number of years ago by an eminent English chemist that if certain chemical reactions could be made to work practically, the center of the so-called grand chemical industry would move from the neighborhood of cheap coal to the neighborhood of cheap solutions of salt. The success of the ammonia process and of this new chlorine process makes it probable that the prediction will soon be verified, and California may expect at some future day—perhaps not in the very near future—to be able to compete successfully in an industry for which she heretofore seemed to possess very slim chances.

Geology of Utah Coal-Fields.

Concerning the Pleasant Valley coal country, Utah, a representative of the Salt Lake Tribune has interviewed Marcus E. Jones about his explorations.

While there he noticed traces of an ancient Cretaceous lake existing ages prior to Lake Bonneville and having a probable connection with the Gulf of California, although no traces of such connection have yet been found. This entire region in those primeval times being about sea level, the Cretaceous sea was no doubt salt like ocean water, and it was not until long after that the upheavals came which finally sent our section of the country up to its present elevation. This Cretaceous lake or inland sea extended from Coalville around through South-eastern Wyoming to Twin Creeks; thence due east into Colorado, and south along the western base of the Rocky mountains into New Mexico and Arizona along the line of the A. & P. R. R. Thence the line followed the north base of the Mogollon mountains into Western Arizona near the San Francisco mountains; and thence due north into Utah, striking the Wasatch mountains, above Silver Reef. The shore line continued over into San Pete valley, and to Thistle, running thence due east, and following the Uintah mountains 200 miles, ran back to Coalville. The area of this Cretaceous sea must have been 75,000 square miles. Its shores from 10 to 15 miles out were very shallow, and composed almost entirely of marl several thou-

sand feet deep. On these shores enormous masses of vegetation accumulated, forming finally beds of peat; and as the shores gradually sank under the water the vast vegetable deposits gradually became the coal measures for which this inter-mountain country is now famous. The sunken marshes became in time covered with 2000 or 3000 feet of sandstone and shale, the shale-beds being impregnated with vegetable matter now found as asphaltum above the coal-beds. Then came the Tertiary upheaval, raising the Cretaceous formation 4000 feet above the sea. This left a depression in the original sea one-fifth its original size, which was occupied by a probably fresh Tertiary lake. This lake was very deep. Its area was about 15,000 square miles, and extended as far north as the west end of the Uintahs, as far south as Arizona, east beyond Grand Junction, and west ten miles this side of Price. So the desert now traversed by the Rio Grande Western is a large part of the bed of this ancient Tertiary lake, but the soil is poor because the lake-bed was almost entirely of clay. But cultivation can in time break this clay up and make it quite passable, while the planting of trees will keep the temperature down, thus preventing the air from becoming saturated with moisture and being precipitated in waterpots by contact with the Cretaceous bluffs. The Tertiary lake heavily washed the shores of the Cretaceous rocks in that rainy, tempestuous period, tearing, wearing, boring them into all sorts of shapes, so that they now stand in some places over 2000 feet high in walls, battlements, canyons, gorges, gulches and gullies. Passengers along the Rio Grande road see wonderful evidences of this. The action of the water in this age exposed the great coal deposits now cropping out everywhere in Eastern Utah. The Tertiary lake was gradually elevated and drained, forming the canyon of the Colorado and leaving Dry Castle valley, Green river valley, and the valley of the Gunnison. Since then, the rivers and streams there have worn away these beds so that nothing remains there of the old Tertiary sea-bed except isolated mesas.

The great coal-beds formed a little below the middle of the Cretaceous period were left exposed in the faces of the great cliffs for hundreds of miles along the shores of the Tertiary sea, and in about every canyon and promontory the veins were sticking out. There are only two well-marked coal-beds in Utah, and these extend the length of the Territory, being exposed in places nearly all the way. In Southern Utah, near the iron mines, they run 37 per cent in fixed carbon—that is, carbon that won't volatilize at a red heat. The coal also crops out extensively west of Price, at Pleasant Valley, San Pete, and other places. The San Pete coal runs as high as 52 per cent in fixed carbon. The Fairview (P. V.) coal runs from 47 to 49 per cent. At Castle Gate the six-foot vein of the Ogden Coal Co. runs 52 per cent, with three per cent ash, and the 14-foot vein of the P. V. Co., six miles south of there, is about the same. The P. V. mines' management say they will make a fair coke to do for ordinary purposes. Crested Butte coal has 67 per cent of fixed carbon, but Prof. Jones is confident that anthracite will yet be found in Eastern Utah and at the surface, and this will have 85 per cent of fixed carbon. The higher this percentage, the greater the coal's value for smelting. The Sunnyside coal is of the same vein as the Ogden and P. V. companies at Castle Gate; it assays 52 per cent fixed carbon, and is as valuable as any other coal of the same nature, but the miners there find it inconvenient to haul ten miles from the railroad track.

There is evidence of the precious metals in the old Tertiary sea-bed, and this bed will yet reveal the remains of exceedingly interesting mammals of that age. North of the Uintahs there was an inland sea almost as large as the Tertiary sea and contemporary with it, occupying the region between Evanston and east of Green River, going as far north nearly as Fossil station on the Oregon Short Line, and washing the Uintah shores on the south. In the bed of that sea, Professors Marsh, Cope and Sydney have found the most interesting fossils ever discovered in North America; remains of gigantic tigers, elephants, alou, bears, cattle, monkeys, camels, and horses of one, two and three toes. This northern sea covered about 10,000 square miles of country.

ELECTRIC LIGHTS IN ICE.—A very novel and interesting exhibition was made at the late exposition in Cincinnati. The exhibition was an incandescent electric light frozen in ice. The process of freezing was performed in the presence of visitors, and while the process was going on various colored aniline dyes were thrown upon the ice and the most beautiful effects in color and formations produced, and then there was the glass bulb that we are all so familiar with, with its filmy trace of wire, upon which the electric current flashed and glowed at the will of the operator. Of course some heat is generated by the light, and to think of freezing it in a solid chunk of ice and not cracking the glass, and the electric light working successfully, seems more like a miracle than a human accomplishment. It attracted great attention.

ANACONDA real estate, and mines in the vicinity of Anaconda, M. T., are in great demand now. The city has now 6000 inhabitants.

MORE than 1000 men are now employed on the Oregon Pacific road above Tehama.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PLYMOUTH CONSOLIDATED.—*Ledger*, Dec. 1: They are still hoisting water from the Pacific shaft, employing only one shift per day. The water has been lowered to the 1,400-foot level; but there yet remains over 300 feet of water to take out; and considering the vast chambers which have been stowed out below the water-level, unless something is done to facilitate the present method of drainage, it will be a long time yet before the bottom of the shaft is reached. The two tanks which are used in hoisting water hold 500 gallons each. As far as the water has been lowered the shaft has been found comparatively uninjured—in fact much less damaged than was expected. This week, however, in one of the compartments the tank seemed to meet with some obstacle, and occasionally came up only partially filled. The reason for this is thought to be that the timbers have pinched or come together, contracting the shaft so that the opening is not sufficient to enable the tank to descend. Nothing has been done toward exploring the mine at the point where the fire started. The other shafts remain closed, and this prevents the circulation of air, so that in its present condition the air in the levels is too foul to admit of any investigation. As to the damage caused by the caving of the stopes, owing to their being under water so long, nothing, of course, can be known at present. But, considering the fact that the men were driven from the mine before the least precautions could be taken against possible damage from flooding, it is more than probable that extensive caves have occurred, which will involve an immense amount of labor before the mine can be got into working shape again. Why the drainage of the mine progresses so slowly, and why the work is not prosecuted night and day without intermission, is a mystery. There is, no doubt, some cause for it. Two causes have been hinted at—one, to await the action of the annual meeting of stockholders; another, to affect the price of stock on the New York market. Whether either of these is the true explanation of the situation we are unable to say.

NORTH STAR.—The North Star continues to look well. They are drifting alongside the vein, and have not broken into it this week.

NEW LONDON.—*Amador Ledger*, Nov. 29: Mr. John Ballard, one of the owners in the New London mine, was in Jackson Wednesday. He and his partner, Mr. Martin, have expended over \$100,000 in developing the New London, without crushing a pound of rock or taking out a dollar. They have a two-compartment shaft 1230 feet deep, and 2000 feet of levels in their mine. They are now taking out fine milling ore from a 12-foot ledge in their north level, the deepest one in the mine. This rock is taken from a point 100 feet from the shaft and about 1000 from the north boundary of the mine. All through it is the best rock yet found in the mine, although they have high-grade ore in a number of other places in the mine. The company expects to put up a large mill in the spring.

SUTTER CREEK G. M.—We gain the following from the superintendent: The 10-stamp mill resumed operations on Nov. 22. For the week ending Nov. 28th, have milled 90 tons of ore. At present they are not breaking any ore in the mine, as several hundred tons have been stored away. The Cosmopolitan is in 55 feet in its crosscut east, and the ground continues hard. They don't expect to cut the ledge before they are in 80 feet. The North California put on four men Monday. They have eight men now, and are drifting north and crosscutting east. They will have their mill ready in another week. The Gover is running their mill steadily now and have plenty of water. Their reservoir has been finished by the contractor, Mr. A. B. Summers, and turned over to the company. The Pacific Con. Mining Co. have put on another shift and are running night and day.

KENNEDY.—This mine is now among the permanent institutions of the county, being down about 1100 feet. The 40-stamp mill is now running its full capacity on rock from the 1050-foot and 700-levels, the last cleanup being the best since the erection of the new mill. The north shaft is now down about 750 feet, and will be sunk to the depth of the south shaft—1100 feet—as rapidly as possible. The motive-power for both mill and hoisting works is water from the Amador canal. At the north shaft they are putting in a boiler so as to run by steam should the water supply freeze up during coning winter.

REED & ASKEY.—A rich strike was made in the face of the tunnel running north, last week. The ledge is four feet wide and will mill \$30 per ton in free gold. The owners have just erected a new 10-stamp mill, which is to be run by water-power.

MCKENZIE.—At this property, near Irishtown, they have just put in three Frue concentrators at the mill and expect to start crushing at once.

KENNEDY.—*Amador Ledger*, Nov. 24: This mine is moving along prosperously, giving every indication of a valuable and permanent mine. The mill is kept running steadily at its full capacity of 40 stamps. It is supplied with ore extracted from the lowest level just opened at 1050 feet, hoisted through the main or south shaft, and also with rock from the 700-foot level from the north shaft. From both points, the rock taken out is looking remarkably well. The cleanup last month was one of the best ever made since the mine resumed operations.

PLYMOUTH CON. MINING CO.—The work of opening the mine progresses steadily. The superintendent, E. L. Montgomery, writes to the New York office as follows: "We are gradually lowering the water; it is now a foot below No. 3 tunnel (which is 1237 feet down). So far everything appears to be in good order and the work goes on without mishap. We hope in the near future to have the old mine open again. The circulation of air through the south shaft is not very strong yet, but as we get the water down it will increase."

NEW LONDON.—At this mine near Plymouth, at the depth of 1200 feet, in the south drift, a large body of fine quartz was struck last Thursday. The size of the ledge is variously given from 8 to 12 feet thick. As to the quality of the rock we have received no definite information except that parcels sent to San Francisco for assay yielded over \$200 per ton.

This is by far the most important development made in this mine.

ALPI MINE.—An effort is being made to start this claim, which is located two miles south of Jackson. The croppings indicate an immense quartz ledge. A shaft has been sunk 50 feet, and to this depth the ledge shows as strong as the surface indications. It is owned by W. F. Detert and others. W. T. Robinson has secured a bond of the property for two years.

El Dorado.

BOBBY BURNS.—*Placerville Observer*, Nov. 27: The Bobby Burns mine, seven miles east of the town, has a shaft down 50 feet and a level run south about 30 feet. The ledge is from three to five feet in width, showing free gold in every pound of ore taken out. This mine was partially opened 26 years ago. The owners, Blair brothers, Tom Stephens and Tom Alderson, thought so favorably of the mine, even in those early days, that they procured a patent for it. About two months ago they commenced work, and with two men have sunk 50 feet and run a level 30 feet, showing that the ground is easily worked.

Mono.

SMELTERS AT WORK.—*Homer Mining Index*, Nov. 27: The Star M. and Reduction Co. is composed of capitalists from Montana, who have erected suitable buildings and machinery with sufficient capacity to reduce 150 tons of ore daily. The company's mine is located at North Fork, south of Homer district, in an immense basin immediately under the pinnacle of Mount Raymond, at an elevation of about 8500 feet above sea level. The sides of the basin rise precipitously, affording great facilities for attacking the lode by quarrying to a considerable depth below the croppings. The ore is argilliferous galena, averaging 20 per cent lead and 22 ounces of silver. On the middle of the principal outcrop ore is being extracted by means of an open cut 40 feet wide, which shows a bank of ore 20 feet high, and in places streaks of pure galena several feet thick. The ore is apparently richer for 10 or 12 feet proximate to the walls, but is generally diffused throughout the whole vein, which is fully 100 feet in width. The company has gone to work in real earnest, and being composed of practical men, with adequate means for actively prosecuting the work in hand, will undoubtedly make a success of the venture, and thus attract still more the attention of capital to the varied mineral resources of these hills.

THE DREADNAUGHT.—Thomas J. Agnew came over from his Dreadnaught mine last week, where he has been doing assessment work. This mine is located on the ridge about a mile and a half north from the east end of Lundy lake, in the second or more westerly belt of limestone which crosses this canyon at a right angle. There is an immense body of galena ore in it that will yield, by smelting process, not less than \$20 and as high as \$35 per ton, standing at a fair average of \$30. A shaft 80 feet in depth is all the way in ore, and numerous open cuts on the surface show good smelting material in all directions. For a distance of 160 feet by the tape-line, there is an unbroken mass of galena. In other places along the location the mineral lies in kidneys and hunches of varying dimensions.

ABANDONED LOCATIONS.—*Homer Mining Index*, Nov. 27: Now that there is a good prospect of the camp becoming a little more active next spring, old residents are scratching together their recollections concerning locations that were abandoned in the earlier days of the district, when greedy prospectors were satisfied with scarcely less than mortar rock. Many of those old claims showed up well and will doubtless be looked after again. The records, preserved only in the files of the *Index*, show that scores of ledges remain to be rediscovered and claimed. Many of them, which at that time were considered too low-grade to conform to the expectations of a Mill creek millionaire, were, in fact, really good prospects, and will not be permitted to lie fallow much longer.

CLEANUP.—The Pierce mill cleaned up last Monday, after a good run on May Lundy ore, which will probably be the last of the season. The result was a large wad of gold, which would be a good winter's stake for several men and their friends. The ore averaged \$130 per ton, which in some camps would be considered "fair to middling."

Nevada.

THE NORTH BANNER.—*Nevada Transcript*, Nov. 29: The pumping and hoisting machinery of the North Banner mine near this city, says the *Union*, was started up on Saturday and was found to work well. The machinery is set up in a station on the tunnel level, 1500 feet from its mouth, and water-power is conveyed to it by means of a pipe-line, which is laid through an upraise which was made through to the surface on the incline of the vein, and takes water from a large tank, which is supplied by a branch ditch of the South Yuba canal. The water from this pipe-line drives the Pelton wheels which do the pumping and hoisting, and the waste water then passes out through the tunnel and serves to run concentrators at the new mill which is situated below the mouth of the tunnel. The tunnel has been enlarged and straightened, and a track with I rails laid down, over which the cars with ore and waste will be run. The shaft is now 30 feet below the level of the tunnel, where the vein shows about three feet in width and carrying ore of high grade. Now that the machinery is in working order the sinking of the shaft will be resumed, and will be sunk about 90 feet, when a new level will be opened. There also yet remains a large quantity of ore in the stopes above the tunnel, much of which is no doubt of high grade, judging from the results heretofore obtained from it. The new mill, which has been undergoing construction at the same time the mine improvements were in progress, will be ready for crushing in a week or more, and will be a complete structure in its reducing and amalgamating facilities. The mill will have ten stamps and all of the best improvements for mill work. There are now 500 tons of ore ready for milling, and the supply will be added to as fast as possible.

AMERICAN-HILL QUARTZ.—*Transcript*, Nov. 29: Brodie and Wheeler have commenced to work a quartz ledge situated on American Hill, west of town. Some years since, Grover, Hirschman & Co. took out three crushings from the same ledge, which yielded, respectively, \$61, \$56 and \$36 per ton. Believing that where such rock was once found there must be more of the same kind, Messrs. Brodie and Wheeler have started to work. The original owners

found good pay gravel on the ground and left the quartz to work it, so the ledge has until now remained idle.

Placer.

THE RED POINT MINE.—*Placer Herald*, Dec. 1: This mine belongs to the French Co. and is about two miles above Damascus. This company owns a large area of mining ground on the divide and has bonded several claims besides. The discovery of this gravel deposit is due as much to surveying as to prospecting. The company made careful and elaborate surveys before breaking ground. The result of their prospecting has but confirmed the belief entertained by many miners that a rich and deep channel extends down the divide as far as Spring Garden, where it makes a sharp bend to the left and extends into El Dorado county. This channel may not be continuous, but there are good reasons for believing that it is. At any rate no developments so far made have demonstrated to the contrary. The tunnel was begun on the second day of August, 1886, and is 3349 feet in length. With the exception of the first hundred feet the tunnel was run by Burleigh drills. The height is six feet. The mouth of the tunnel is 70 feet higher than the Mountain Gate tunnel at Damascus. The tunnel is very dry and comfortable. The channel has been worked on both sides of the tunnel, but has paid better on the eastern or up-stream side than on the western. On the eastern side the average yield was \$3.70 to the car-load, and on the western \$2.35. This difference in the yield was caused by the channel widening as it followed down the divide, the width at the point worked being 650 feet. On the western side a block of ground 40x650 feet has been opened up. Owing to the scarcity of water the men have been kept at work blocking out the ground, so that when water comes a large force of men could be set at work running out gravel. Some 40 men have been employed at the mine in various capacities during the summer and fall. The gold is of a reddish cast, and is of fine quality, averaging 932 in fineness. The compressor works, store, boarding-house and office are located 800 feet below the crest of the ridge on Red Point, which looks as though it had slid out of the hillside and stopped just as it was about to fall over into the canyon. The mine is under the able management of Supt. C. F. Hoffman, who unites a practical knowledge of mining with the theoretical and scientific. The company has shown its great faith in the divide by purchasing and operating mines that had hardly been prospected. It has brought the means to open up a large section of ground that would not have been opened for years, and has turned the attention of mining men to the higher mining districts, and has shown them that the old river-beds of Placer offer greater inducements to investment than do the silver mines of the State of Nevada.

ON THE DIVIDE.—*Placer Argus*, Dec. 1: The channel at the Dardanelles has widened out and is yielding extra good pay. The prospects have brightened up during the week, so that a large force will be employed soon. The Swindle Hill claim is being worked with good prospects. Riley, Hoffman & Jewel have tunneled at the Last Hope on one of the bends in Brushy canyon. The location at the bend is fine, and the prospects are that they will have one of the best claims on the divide. Good pay has been taken out already. Some men are at work on the tailings from the Missouri claim in Devil's canyon. They are well pleased with the returns. The 20-stamp mill at the Mayflower is about finished, and is expected to start this week. The gravel in the mine is prospecting rich. A large force of men will be put on soon. F. Chappellet is going to start a tunnel on the Eureka, about four miles from the Red Point. The Gray Eagle men are hard at work putting up their heavy machinery. L. Remler says that there has never been a better outlook for the Divide than at present. All the mines have excellent prospects and are all on the point of putting on large forces. The miners all receive their pay regularly, and all kinds of business are on a solid basis. The Divide is booming without a doubt.

Shasta.

FROM WHISKYTOWN.—*Cor Shasta Courier*, Dec. 1: Geo. H. Knox, the veteran prospector, who has been working the old North Star mine on Grizzly Gulch, is being rewarded, as the mine shows up splendidly with good ore from which the filthy lucre protrudes in abundance. John Bauder and son are opening up a fine prospect on Whiskey creek, which we would not doubt be safe in predicting the coming bonanza of this section. J. M. Daugherty, of the Green & Co. mine on Mad Mule, reports the mine looking well. A. J. Woodward and Joseph Jones are surprising the neighborhood with a fine prospect and rich specimens.

GOLD.—*Shasta Courier*, Dec. 1: An old miner of 27 years' experience in this neighborhood predicts that the boss mines of Shasta county, for pocket, seam and quartz, will be found in less than five years between Spring creek and Salt creek. Spring, Rock, Middle and Salt creeks have been immensely rich in beds and bars of free gold, coarse and fine, and often mixed with quartz. Many of the flats and plateaus between have paid wonderfully well, and quartz ledges crop out by the hundred, and many more are hidden just beneath the surface by overwash and slides. That old miner is only one of many who holds to his opinion. The history of Bunker Hill mine shows that gold by the muleload is liable to be found in the district mentioned, and the Jarvis, and Engnm & Wright strike, the Hoey, Lowery, and other pockets are testimonials of what may be found in the territory alluded to.

COLEMAN.—Wm. T. Coleman came down from French Gulch Monday and went on to S. F. He has spent a month inspecting his Niagara mines and mills in French Gulch and Trinity, and is well satisfied and pleased with the mines and the way they are managed by his efficient superintendents and agents, chief among whom is John Sutherland of the Niagara.

MILL STARTED.—The rains having furnished sufficient water, five stamps on the Frank Wheeler mill at French Gulch have been started, and with more rain the mill and mine will be worked with full force.

ORE SHIPPING.—*Redding Free Press*, Nov. 27: Two years ago not a ton of ore was shipped from this county for smelting purposes, but since it has been discovered that there is considerable profit in the operation, mining men have turned their attention to its advantages, and the following mines are now shipping ore to San Francisco: Mammoth,

Texas and Georgia mines, Old Diggings, Nelly, Iron Mountain, Phoenix, Whiskytown, Snyder, Squaw Creek, and the Nason & Merrill, Sacramento river. It is to be hoped that the ore can be worked successfully in the county in the near future.

KENNETT ITEMS.—The Butters Ore Milling Works will start up about December 1st. Ore is now coming in. The Central mine shipped the first car of crushed ore to the works. Hart & Fleming of the Texas mine are now making preparations to ship to these works. Assays are coming in rapidly and the laboratory is now kept quite busy. The works have about 250 cords of wood in the yard. Fader is making rapid progress in the freighting of the Warner and the Carson & Snyder mills. Nearly all of the machinery for both mills is now on Squaw creek. The representative of the Sierra Buttes Co., who is examining the Uncle Sam mines, passed through Kennet Sunday. He seemed pleased with the outlook. The prospect for an active winter in mining is good. Outside capital is coming in, and Shasta county will be an active center of successful mining before two years have passed away.

THE OLD JOSEPHINE MINE.—Mrs. J. Lutz of Star gulch, who was in town on Tuesday, informs us that the Walker brothers are making things lively there, and are employing a large force of men in their operations. Their ten-stamp mill is being pushed rapidly to completion, and will be ready for starting up about the middle of next month. They have commenced a new tunnel into the hill near their headquarters, and are sanguine in their expectations of rich developments in the near future.

Siskiyou.

GRAVEL MINERS.—*Yreka Journal*, Nov. 28: The river miners on the Klamath are still at work with good success; the storms so far not interfering with operations, nor the weather cold enough to render the delving in the cuts dangerous. A heavy storm next month to flood the river may force them to pull out, or freezing weather will cause a suspension, owing to the frozen banks being dangerous, by caving, or boulders dropping, as the sun thaws in the daytime. The hydraulic miners in the various districts are making preparations for more extensive operations during the approaching winter, by laying more pipe of larger caliber, besides enlarging and improving the ditches to secure greater power for the giants. In the high gulch, or dry diggings, the miners are also fully prepared with piles of pay gravel for washing, and the dams and sluices are in good order for doing a rushing business when the storms come and while the water lasts after each storm.

Trinity.

BIG SLIDE.—*Journal*, Dec. 1: One night last week the timbers holding the waste dump at the Brown Bear mine gave way and let that immense quantity of debris down the gulch, covering up Frank & McDonald's lower tunnel so as to prevent work in it for several weeks. Mr. Roberts had been working in the tunnel up to midnight, but for some reason did not return that night after going to lunch, consequently there was no one in the tunnel when the slide occurred at about 2 o'clock A. M. It was very fortunate for Mr. Roberts, for if he had been buried in the tunnel it would have taken, at least calculation, from 24 to 48 hours to have liberated him from his underground quarters. We are informed that the company will not attempt to remove any of the slide, but will run a tunnel in the solid ground to tap the one now covered.

NEW RIVER.—F. J. Ladd, one of the owners of the Mountain Boomer quartz mine, New River, was in town this week and says that the camp is holding its own. There are some first-class mines there, but it will take time and money to develop them. He has every confidence in the future of the district.

Tulare.

SILVER.—*Porterville Enterprise*, Nov. 24: J. S. White informs us that a company located a claim on Deer creek and a shaft was sunk 100 feet in depth, drifts being run in several directions showing silver ore in abundance, assaying away into the thousands. The claim is owned by Mr. Morrison, John Roth and W. B. Wallace. A gentleman from Nevada, who has had large experience in silver mining, was there several days recently and pronounced it a valuable location. He went below with the intention of trying to get capitalists to take hold of it, and if he succeeds, hoisting works and a mill will be erected. Water and wood are plentiful, and a good wagon-road leads direct to the mine, and it is but a few miles from the railroad.

NEVADA.

Washoe District.

CROWN POINT.—*Virginia Enterprise*, Dec. 1: Have stopped No. 2 west crosscut on the 700 level to allow the water to drain from the face, and have started a south drift in the quartz, which is out 26 feet. The face is in quartz yielding fair assays. Shipped during the week 171 tons of ore to the Mexican mill for reduction.

HALE & NORCROSS.—On the 500 level the west drift was advanced 35 feet, making its total length 640 feet. Have done some necessary repairs to the main shaft and in different parts of the mine, and have constructed a new waste chute from the 700 to the 400 level, which required almost all our men during the week. Have commenced to stope ore from the 500 level and during the week hoisted 160 tons of pay-ore from the 500 and 700 levels. On the 25th inst. shipped to the Mexican mill 97 tons of ore and to-day 142 tons, and will continue to ship regularly and keep the mill fully supplied.

ALTA.—Have stopped the mill for two weeks for the purpose of changing its present working form to amalgamation and concentration. It has been found that much of the ore will amalgamate. Two concentrators will be set to run from two batteries, and each concentrator will take the crushing of the battery in that way, and the pulp will flow from the tail of the concentrators to the tanks, and will be put through the pans in the regular way. It is expected to get a very high percentage of the ore in this way, probably as high as 96 per cent.

GOULD & CURRY.—450 level—West crosscut started 60 feet from the top of the upraise from 500 level, has been extended 24 feet; total length, 104 feet; formation quartz, giving low assays.

BEST & BELCHER.—300 level—In west crosscut No. 1, 120 feet from the main northwest drift incline winze, has been sunk 20 feet; total length, 39 feet;

passing through porphyry and ore, the latter of fair assay value. At a point 25 feet west of the incline winze, a north drift has been advanced 25 feet; formation porphyry, clay and quartz, showing some value.

SAVAGE.—Men are employed easing timbers on the different levels and in the main shaft. During the week 732 tons of rock were hoisted 437½ tons shipped to the Rock Point mill, and 497 tons crushed. Average battery assays of the same were \$19.87 per ton. Have bullion on hand of the assay value of \$901.75.

BELCHER.—The 200 level north drift was advanced 30 feet during the week, making its total length 192 feet. Have turned the joint Seg. Belcher 1100 drift to the southwest and advanced 30 feet, making the total distance from the station 50 feet. The face is in good working ground.

CONFIDENCE.—The raise from the 1200 level to connect with the 1100 is up 50 feet, having advanced 19 feet during the week. Have shipped during the week to the Brunswick mill for reduction 103 tons of ore; the average battery samples show a value of \$22.95 per ton.

ALPHEA.—The 500 level north lateral drift is north of the shaft 182 feet; the face is in clay and quartz. The south lateral drift on the same level is in south of the shaft 85 feet; the face is in quartz that assays from \$12 to \$20 per ton.

YELLOW JACKET.—Running prospective drifts throughout the mine. The men at work extracting gold ore were laid off on the 28th pending the result of the test run of ore just working.

IMPERIAL.—The repairs to the main north drift on the 1100 level are almost completed, and have commenced to clean out east crosscut No. 1 preparatory to run across the vein.

CHOLLAR.—The raise from the north drift on the 650 level continues in low-grade quartz. The west drifts on the 750 and 850 levels are still in clay and quartz.

KEYSTONE.—The 300 level drift is still in hard rock, but it is approaching the vein, judging from its character, and it is liable to strike it at any moment.

SEG. BELCHER.—Have turned the east drift from the 100 station to the southwest and advanced it 30 feet. The face is in good working ground.

ANDES.—Have repaired stations No. 1 and No. 3, and are now repairing station No. 2. Are doing the usual work on the 350 and 240 levels.

CHALLENGE.—Shipped from this mine during the week 305 tons of ore, the average battery samples of which show a value of \$22.95 per ton.

BULLION.—Will have hoisting works in good running order again by next Tuesday, when the mining work will be resumed.

SCORPION.—On the 300 level the west crosscut has been advanced 15 feet during the week; the total length is 300 feet.

JUSTICE.—Are still stopping milling ore from the southeast winze. The west drift is now out 162 feet.

BALTIMORE.—Continue to extract high-grade ore from the upraise above the 338 level.

POROSI.—The 650 level south drift is showing clay and porphyry.

Ely District.

SHUT DOWN.—White Pine News, Dec. 1: The Ely G. M. and M. Co. shut down both mine and mill this week, and it is not likely they will resume operations before spring. The last run at the mill was made under difficulties of insufficient water-power.

Eureka District.

THE DIAMOND.—Eureka Sentinel, Dec. 1: The event of the week in mining circles in Eureka was the conditional sale of the Diamond mine to Messrs. Richard McIntosh and Charles Read of Salt Lake, both practical mining and smelting men, for the sum of \$60,000. A contract was let for the running of the tunnel to D. H. Foley, one of the owners of the Diamond, at \$11 per lateral foot. It is to be 407 feet long and will enter the Diamond ledge about 80 feet below the present workings. The purchasers furnish cars, track, and a complete black-smithing outfit. They will also incur other expenses amounting in the aggregate to about \$10,000. The purchasers show their faith in the property by paying for the construction of the tunnel and other necessary work.

ORE SHIPMENTS.—Sentinel, Dec. 1: The following number of tons of ore were shipped from the mines of the district to the furnaces: Dunderberg mine, 145½ tons; Macon City, 7 tons; Jackson, 269 tons; Diamond, 20 tons; West End, 25½ tons; Climax, 13½ tons; Silver Lick, 7 tons; Whip-poor-will, 2½ tons; Eureka Tunnel, 39½ tons; Sterling, 1½ tons; Williamsburg, 1½ tons; Mineral Hill, 5 tons; White Pine, 10½ tons; Hoosac, 46 tons; Democrat, 2 tons; Ethel, 1½ tons; Reveille, 4½ tons; Belmont, 5½ tons; and Seventy-Six, 1 ton.

Morey District.

PAYING.—Belmont Courier, Dec. 1: Work in the Morey mines is pushed with energy, and the ore extracted is of a paying quality.

New Pass District.

NEW CRUSHER.—Silver State, Dec. 1: E. E. Stearitt arrived yesterday from New Pass, where he is engaged in mining. The New Pass Co., of which he is a member, has ten men at work. They have ore enough on the dump to run a ten-stamp mill a month and an unlimited quantity of it in sight. They are putting up a Huntington crusher of 12 tons a day capacity and expect to have it running in three weeks. The lead on which they are at work averages about three and one-half feet wide and carries gold-bearing quartz exclusively. The mine was worked to a considerable extent, but as nothing less than \$20 per ton in free gold would pay in those days, the mill was taken to White Pine 20 years ago. The company has a U. S. patent for the mine.

Oscola District.

BEING WORKED.—Cor. White Pine News, Dec. 1: Capt. D. B. Akey & Co. are attending to their properties in good shape, which consist of the Cumberland, Royal Fish, Osceola, Union Jack, Florida and others. Work is also being done on the Gold Hill group. These with other good mines will soon bring Osceola on top as a gold-producing district. It is here both in quantity and quality, with facilities that cannot be excelled by any mining district on the coast.

Spanish Belt District.

BARCELONA.—Belmont Courier, Dec. 1: Work

in the Barcelona mine at Spanish Belt is progressing satisfactorily, and the ore extracted from this mine is of an excellent grade. The Barcelona is one of the best mining properties in this State. The Monitor-Belmont mill has been repaired and is running again on ore from the Barcelona mine. Lessee J. E. Severance received a lot of quicksilver on Sunday, and he expects that the mill will turn out fine bullion in large quantities.

Tybo District.

GOOD ORE.—Belmont Courier, Dec. 1: The Dimick mine is still producing large quantities of good ore.

ARIZONA.

OUR BIG COPPER MINE.—Arizona Silver Belt, Nov. 27: Information from the Old Dominion Copper Co.'s works is of a most encouraging nature. The output of copper has been continuous, and the result of this year's operations cannot but prove highly satisfactory to the company. The bins at the smelter are full of coke and a considerable quantity is en route from Wilcox; also a large consignment due at the latter place, its arrival having been delayed by difficulty met with in securing cars for its transportation. At the mine the showing is exceptionally good. The sixth level has been rapidly opened from the new shaft, the main ore body is already exposed at two points 140 feet apart, and stoping is now well under way. Other portions of the mine, we are told, look exceedingly well.

LUCKY CUS.—The winze between the 300 and 400 levels continues to yield the usual amount of ore. Work on the 400 north drift is being pushed ahead as rapidly as possible, as its connection with the winze from the 300 will open up a fine lot of stoping ground. Nothing new at the Mamie. The usual number of men are at work on the 700 and 300 levels extracting ore of a good grade. At the Brother Jonathan the work is still confined between the surface and the 50-foot level with fair results. The Sulphurets look well and ships about the usual amount of good-grade ore. At the Herschel considerable work is being done, the result being a fine yield of high-grade ore. This has every prospect of becoming a big profitable mine. A great deal of assessment is now being done in this district and in several cases with promises of good ore bodies. It is expected that the long drawn out suit between the Head Center and Tranquility will be decided by the Supreme Court of California next February. This suit is for a distribution of stock, after which there appears to be a prospect for a resumption of operations on these properties, which owe belong to the Contention Co.

BRITISH COLUMBIA.

ORE IN CARS.—Donald Truth, Nov. 27: Today (Saturday) the British Columbia Smelting Co. at Field had two carloads of ore standing on the sidetrack, and 20 more on the dump. If snow does not interfere with the tramway, regular shipments can be made from this time on, and the newspapers of British Columbia can herald the fact that at least one quartz mine in the Province has been developed into an ore-shipping.

COLD WEATHER CAME TOO EARLY.—R. L. T. Galbraith reports that the Chinese companies on Wild Horse creek were unable to finish their cleanups on account of the cold weather; but what they did clean up gave very satisfactory returns. He also reports that placer mining in the district tributary to Fort Steele has, in late years, never looked more promising.

THE KOOTENAY PLACERS.—Donald Truth, Nov. 17: The Perry Creek G. M. Co. has its tunnel in 535 feet, it following pretty much the same course as the old tunnel, being above it and in 15 feet farther. The work is in the old river channel, and going through what has evidently been a canyon. So long as they are in this canyon, gold is not expected to be found in paying quantities, as the bedrock is so smooth that gold would not remain on it. The gravel taken out prospects from 10 to 15 cents to the pan; but the returns are small, for the reason that more boulders than dirt are taken out in driving the tunnel. From present indications the channel will soon take a turn; if so, the bedrock will form a natural rifle, and immensely rich ground is sure to be struck. Part of the force are at work building an office and a storeroom. Work will be prosecuted all winter.

THE OTHER CREEKS.—Mr. Leonard, a practical miner who has stuck to Weaver creek for years, is reported to have done well this season, making a cleanup of over \$5000 in coarse gold. He has two men at work and will increase the force next summer. Weaver creek is a short distance from Cranbrook. The mining engineer who has charge of the work on Findlay creek is absent in California. The outlook is reported as good, and several small cleanups have been made. A windmill is being built in Bull river from which great results are expected. The ground lately worked has not turned out well, and operations will be resumed on the same side of the stream that has heretofore given good returns. Moyea creek is reported as no good. The only man holding his ground is the well-known Pat Quirk. The Chinamen, even, had to get up and dust.

WILD HORSE CREEK.—The four Chinese companies on Wild Horse are cleaning up for the season. So far, one of the companies had deeded up one flume out of four, getting over \$1000. Mr. Griffith, the only white man operating on the creek, is hydraulicking, and has not cleaned up for three years. He will not make a cleanup this year. He thinks he has between \$15,000 and \$20,000 in his flumes, and has picked up several good nuggets this summer, one of them being worth \$50, one \$15 and one \$11.

COLORADO.

SILVERTON.—Miner, Nov. 27: Joe Long and Frank Jones have a contract on the Ajax, one of the properties lately purchased by Colonel Horatio Page for a Boston syndicate. Capt. Horatio Page is thinking seriously of putting a force on the Victoria this winter. There is plenty of ore in sight, and we hope to see the mine one of our steady producers. The No Name lode at Needleton situated opposite the water-tank has been relocated by E. S. Ferguson, who is now busy doing the assessment work. The property near the Sunnyside mentioned last week is named the Clipper. It is being worked

by an English Co., and is under the superintendence of Captain Steel. The ore is a heavy galena running about 60 per cent. Wm. Feigel has just completed the improvements to the Whale stamp-mill, owned by Smith & Downing. The mill has mineral enough on hand to keep it busy all winter. We understand that the Mattie, situated up Cement creek, and owned by the Malchus Bros. and others, is likely to change hands shortly. The money to buy it is now in the bank and the final papers will probably be signed in the course of a few days.

DAKOTA.

RETRIEVER.—Deadwood Pioneer, Nov. 27: The corporation owns a group of five quite well developed Bald Mountain claims. On each, good ore is considerable quantity has been disclosed by operations of past years. Samples and assays of the different ore bodies, and of the ore now on the dump, establish its average value as between \$30 and \$35 per ton. At present there are not less than 4000 tons of ore of this value on the dump. The number of tons has been more frequently estimated at 7000 than at 4000. The company owns \$5000 worth of reduction works stock, and recently let a contract for hauling 500 tons of ore from the mine to the works, to Ed Goulette of Central. Tide to the claims is good, and will be perfect within the next few days, as the company is about receiving United States patent for them.

JUNEAU.—George S. Hopkins has completed surveys of claims belonging to the Juneau Co., Bald Mountain. Specimens of ore from the property were exhibited yesterday, which it is stated will run \$30 to \$40 to the ton. Walter Wood, lessee of the Adelphi, was over at Galena Friday, and made satisfactory arrangements with Mr. Terhune to have the Adelphi ore treated at the Galena smelter. Mr. Wood informs us that he gets much better results than at Omaha or Kansas City, and of course regrets having not saved the ore for Galena.

SMELTER.—The Galena smelter is running very smoothly, and the results so far are satisfactory alike to miners and smelters. Now let the miners put forth an extra effort to keep a supply of ore on hand for a continuous run. It puts money in circulation, gives employment to a large number of miners and laborers, and is a good advertisement for the camp and country.

UTAH.

REVIEW.—Salt Lake Tribune, Nov. 30: The week has been a good one for the handling of the minerals. Ore has come in freely and the bullion product has been large. The most important event of the week has been the strike in the Bullion-Beck at Tintic. The receipts in this city for the week ending the 28th, inclusive, were to the value of \$237,480.35, of which \$155,277.20 was bullion and \$82,203.15 was ore. For the previous week the receipts were to the value of \$99,064.64, of which \$58,390.80 was bullion and \$40,673.84 was ore. The Ontario product for the week was from three lots of ore sold, \$36,493.85; bullion, 24,895.95 fine ounces; an approximate total of \$61,299.80. The Ontario has deeded Dividend No. 150, payable Nov. 30th, of 50c per share, amounting to \$75,000. This will be \$825,000 so far this year, and \$10,350,000 in dividends in all. The daily output for the week was 11,482.07 fine ounces of silver and 11,225-1000 fine ounces of gold. Nothing is heard locally of the Horn Silver. Fine bar receipts in this city for the week amounted in value to \$66,897.99; base bullion, \$36,066.70; copper matte, \$8890. The product of the Hanauer smelter for the week was bullion of the value of \$25,350; of the Germania, \$18,669.51.

IDAHO.

SEAFAM DISTRICT.—Ketchum Keystone, Nov. 27: George B. Baldwin arrived in town last Thursday from Seafam district, via Custer. Mr. Baldwin is one of the discoverers and pioneers of the above-named district. He is interested in several valuable locations, from some of which he and his partners have been making shipments of ore for the last two or three years. The principal mines owned by him and his company are the White Goat, Birdie R. and Summit. Several tons of ore were shipped to Ketchum during the season from the White Goat mine, which yielded 269 ounces in silver and 24 per cent lead. Mr. Baldwin speaks very highly of the future of Seafam district and surrounding country.

ELK CREEK.—Wardner News, Nov. 27: Nothing but good reports are heard from Elk creek. In the main shaft of the Nellie lode a solid body of fine ore, three feet wide, was struck a few days ago at a depth of 200 feet, while other developments of equal importance are continually made in the various workings. A cleanup was had on the 15th instant, amounting to over \$8000.

DEADWOOD GULCH.—Recent developments in the Apex mine confirm the statements so often made regarding this property that it is destined to prove a valuable mine. The main shaft is down 250 feet, and a drift has been run on the ledge 135 feet showing ore all the way. In this working, at a distance of 100 feet, a large body of ore was recently encountered which increases in quantity and quality as work is now progressing.

HUNTER GULCH.—The building of the Hunter concentrator at the mouth of Hunter gulch is progressing rapidly. A number of skilled mechanics are engaged in its construction, and when finished it will be one of the finest mills on the South Fork. A greater portion of the machinery is now being shipped to Mullan.

MONTANA.

MONTANA COAL.—Helena Independent, Nov. 27: President Hill of the Manitoba says: A large force of men is now employed in these mines night and day, which are being systematically opened and developed. In a short time the output will be 2000 or 1200 tons daily, and this will be regular. The shipment of coal from the mines will be in excess of that amount should there be a demand for it. This coal is of an excellent quality. On this point I speak advisedly. We had the coal veins and their quality examined by Prof. Newbury of the New York School of Mines. The gentleman is an expert, and he pronounced the coal the best he had seen in the

Rocky mountains. The Montana Central engines are using it in preference to any other kind of coal, and the Manitoba Company will use it as far east as Red river. There is another 18-foot vein at Belknap, on the Gros Ventres reservation, but it is not as good as the Sand Conlee product. Following the opening of the mines will be the building of an extensive coking plant, the coking qualities of the coal being unsurpassed. As to the supply, it is practically inexhaustible. The veins are from 40 to 50 miles in width. What Montana needs and must have is cheap fuel.

TWIN MOUNTAIN DISTRICT.—Cor. Anaconda Review, Nov. 24: Many of your readers are interested in the new Carbonate Camp in Twin Mountain district, and I will send you a few pointers from this district. Some two years ago Lee Mantle and Chas. S. Warren grubstaked George Bow, and after looking around awhile he found rich carbonates and made a location between the head of American gulch and Gilsey creek, both tributaries of the Big Hole river. The same prospect was relocated some time in May, 1888, by Thomas Newcomb and J. R. Toole, and on June 13th a party named Edwards, who had many years before found rich float in that vicinity, with Joe Fletcher, discovered a rich carbonate vein, about a mile from French and German trail, and on the summit of main range one mile from Newcomb's location. Mr. Fish, on the L. P. Morton lode, has four feet of good ore. Mr. Fitts of the Grasshopper claim has a very fine vein of lead carbonates. The ore runs from 20 to 500 ounces silver and from 20 to 70 per cent lead. John Dunn, Strong & Co. have good carbonate in their New Orleans claim. Morgan Evans and L. Miller have a good prospect in the Gwinn Fraction lode. Manager Newcomb is working a force of men on the Richmond with very flattering results. McIntyre, McDonald & Co. are opening two very fine claims south of the American Gulch Mining Co.'s property. Walter Beaux, on the Borno, has a claim which will doubtless come up to any in the district. Catlin, Casey and Gregson, on the Old Fish lode, are down about 20 feet with their shaft which gives them good ore. MacCallum, Newcomb and others are working on the Montana, which has a very fine body of ore, assaying about 70 ounces silver. They shipped 20 tons the latter part of August, which brought the camp into note and prospectors flocked to the district. The formation is lime, and it is on the same belt with the Nellie Vipond and Trapper mines, and bids fair to be a great mining camp. Edwards, Fletcher & Co. on the Carbonate & Swan have what is conceded to be a good showing. They are working six men and taking out 80-ounce ore. Dr. Beals is working four men on the tunnel of his gold mine at the head of German gulch. He has had numerous assays which give \$112 in gold. There are many other promising claims in this district, among which we mention the claims of Perry Beals, McDonalds and others which are located about four miles from these others just mentioned, which show that the camp is of considerable extent. The route to this camp is by way of German gulch to Beals, distant from Anaconda about 18 miles, thence by trail on snowshoes 3 miles to Carbonate Camp. As the weather is too inclement to prospect at this season of the year, the miners in the camp, who now number 20, will have considerable ore on the dump when spring comes. What this district needs most is small reduction works, which we are informed will be built early in the spring.

NEW MEXICO.

MOGOLLONS.—Southwest Sentinel, Nov. 27: A sample of ore received in this city from the Mogollons gave on assay a yield of five ounces in gold and 80 ounces of silver per ton. The owner, Mr. Coffee, has a veritable bonanza in sight. A bar of bullion from Capt. Cooney, weighing 25 pounds, was received this week. It represents a run of 6 days with 5 stamps, and fully one-third of its weight is gold. The Sentinel has reliable information that it is now but a mere question of time until the Peacock mill will start up, arrangements having been perfected with that end in view. The storm of Saturday and Sunday will be productive of great good, and will furnish an abundance of water for mining, milling, grazing and domestic purposes.

PIÑOS ALTOS.—The mining outlook for the winter is favorable to all those who are directly interested. Many of the prospects, by spring, if the present rate of development continues, may, with reason, be classified among the producing mines of the county. The Maggie E. mine, on the southwest slope of Atlantic mountain, is rapidly coming to the front as one of the most promising gold prospects in the Territory. Messrs. Ashton, Bagsby & Co., the proprietors, made a lucky investment in the purchase of this property. The developments consist of a main shaft 40 feet in depth, showing a vein of fine milling ore, from 3 to 10 inches in width. A little south of the center of the claim a shallow pit on the vein has exposed a crevice of pay ore worth from \$100 to \$200 per ton. The St. Louis, in the immediate vicinity, the property of Frank Bell, Esq., is being worked under a lease. The vein is large and well defined, and on development is destined to become a very prominent mine in point of production and value of the ores extracted. The Carlisle Mining Co.'s mines produced in the seven months ending July 31st last, \$299,700, of which \$166,000 was gold and \$33,700 silver. This company has paid over \$300,000 in dividends to date. The principal office of the company is London, England, where most of the stock is owned.

OREGON.

THE SUMMIT MINE.—Bedrock Democrat, Nov. 27: The Democrat was favored with a call yesterday from J. P. McCord, one of Baker county's hardy miners and owner of the Summit mine, situated on Chicken creek, about five miles from Weatherby on the O. R. & N. Mr. McCord favored us with a brief account of his operations, which shows that portion of Baker county to be quite rich in mineral wealth. The Summit is of recent discovery, and since its location and up to a short time since Mr. McCord has been busy developing the property and also putting up an arastra to be run by water-power. The arastra was completed a few weeks ago and a run of 1½ tons of ore through it gave a yield of 33 ounces of gold, or \$533. Mr. McCord has a team engaged hauling ore from the mine to the arastra.

MECHANICAL PROGRESS.

Utilizing Petrified Wood.

In our last issue we gave a theory of the origin of the petrified forest of Arizona, as suggested by a popular scientific writer. Following we give from the same source some account of what is being done to turn this vast deposit to useful account:

Agate cutting has been carried on as an industry for over 300 years in the Oberstein district in Germany. But little attention has been paid heretofore to the cutting of large masses, because few agates are found over a foot in diameter, and the handling is not such as to offer much inducement.

Although the amount of silicified wood at this locality (Arizona) is so large—some estimates running as high as a million tons—the material suitable for purposes of decorative art is comparatively small in quantity.

The Drake Company, originally organized to work the quartzite of Sioux Falls, Dakota, have recently experimented with the methods of preparing the agatized wood for market. This silicified wood is brought in tree sections by the carload to the works at Sioux Falls. These sections run from six inches to five feet in diameter, generally with the bark perfectly preserved, and weighing from 50 to 2500 pounds each. The faces of these are irregular, and require to be worn down to a smooth surface. To accomplish this they are set in circular form in what is known as the "Drake Bed," being ten feet in diameter, composed of various-sized sections of the material, set by the use of the spirit level in order to secure an even face. They are then cemented together with calceine, or, if the pieces are small, with hydraulic cement. Then to two arms of a powerful vertical shaft are attached large slabs of Sioux Falls quartzite, in hardness but slightly removed from the wood itself.

These large, flat stones, which extend the full length of the arms, are revolved about the bed, fed by a stream of water and crushed quartzite reduced to the size of a pea. The silicified wood, being harder than the quartzite, soon wears groove in these large stones, and they are frequently reversed and sometimes discarded for fresh ones. For about 40 hours this initial stage of the work proceeds. The feeding of the crushed quartzite calls for fire, despite a copious flow of water upon the bed.

After about 40 hours of such work, the quartzite stones are substituted for large sections of the silicified trees, which have been previously worn upon the bed, and these are revolved for a week, and sometimes two weeks, fed with sand or quartzite until, by abrasion rather than cutting, a face is disclosed on the bed, which, for the first time, indicates the true coloring and quality of the material.

From these beds, each of which requires about 30-horse power when doing their best work, the material is taken up and re-bedded upon a car 30 feet long and 8 feet wide. In proportion to the exactness of face of the different pieces is the success of the undertaking. The car moves by cog, and at the same time males and female concentric rings, the outer of which is six feet in diameter, revolving at 40 revolutions, and here is continued the quartzite sand feed, in order to wear down any inequality of reetting upon the car.

This usually requires two days, and then the bed is cleaned, and diminutive globules, made of chilled iron, are rolled under the rings. These are followed by No. 36 emery. The emery rapidly wears to slush, and this feed is graduated down to No. 70 in fineness.

After a week of work the bed is then washed thoroughly, the rings removed, and large wheels substituted for the rings, which are made from blocks of hardwood, clamped together, presenting a rough surface by being set across the grain of the wood. The speed, both in the movement of the car and of the wheel, is now increased, and oxide of tin begins the burnishing, which is finally brought to a mirror finish by tripoli, fed to felt-covered wheels, which are revolved at 300 per minute. This process is a tedious one. A smaller car is sometimes employed. The sawing is done by a process which the company has not yet given to the public. In working up the material much is necessarily wasted.

Some idea of the hardness of this material may be formed when it is stated that 200 pieces of marble can be sawed up while one piece of agatized wood is being cut.

This petrified wood can be applied to all the purposes for which marble is used, over which it is much superior in both beauty and durability. This material is found in large quantities in Lake county and other localities in this State, but perhaps nowhere in such large masses and in such abundance as in Arizona.

The polished surface shows a beautiful blending of yellow and black, and in some respects resembles the redwood of the big Californian trees.

PRIMITIVE MANGANESE STEEL MANUFACTURE IN INDIA.—Part 3 of Vol. XXI of the Geological Survey Records of India contains an exhaustive and interesting paper by Bahoo Pramatha on the manganese iron and manganese ore of Jabalpur, in which we are reminded that the pyrolusite of Gossapur was first brought to the notice of Government by Mr. W. G. Olpherts in 1875. It has since been desultorily examined and experimented on by Mr. Medlicott and Mr. Mallett, but seems only now be-

ginning to be appreciated at its true worth; now when the uses of manganese as an alloy with iron in the manufacture of steel have been scientifically developed. In India it is employed in the manufacture of what Bahoo Pramatha calls "a kind of steel iron, known as kher"—an industry affected by nearly every village of the Lora Hill Ranges. The furnace in vogue is of a most primitive type, 4 feet 6 inches in height, a foot and a half in breadth, built of mud mixed with straw. The bellows for it are about a foot and a half high when stretched. They are made of goatskins. The making up costs a rupee. A pair will last one full season (November to May). The entire cost of furnace, bellows and all is but a trifle.

Soldering Cast Iron.

A correspondent of the *American Machinist* writes to that journal on the above subject as follows: In a foundry doing agricultural work there are a great many changes to be made to patterns, and often it is desirable to solder brass to cast iron where drilling and riveting to the pattern would make anything but a neat job. By a great many men who work on iron patterns it is considered quite a secret to solder on cast iron, but it is not so. This process is very much the same as soldering on a tinned surface. If the part of iron to be soldered is cast iron that is hard or thin, it should be polished on an emery wheel and made clean and bright. Then dip it in potash water, after which dip it for an instant in clear water and wash it quickly with undiluted muriatic acid of the ordinary strength; go over it with powdered rosin and solder made from half tin and half lead. This must be done quickly, before the surface has time to dry.

Another plan is this: File the surface clean and wash as before; wipe it over with a flux made of sheet zinc dissolved in muriatic acid until it is saturated or is a saturated solution, and has been diluted with its own quantity of water; then sprinkle powdered sal-ammoniac on it, and heat it on a charcoal fire until the sal-ammoniac smokes. Dip it in melted tin and then remove and rap off the surplus tin.

Patterns that are to be canceled are better made from a cheap brass, which can be made of 12 pounds of copper and 8 pounds of zinc. This will make a good yellow brass that will file easy and finish smooth. There are few men that fully understand carding patterns; patterns can be carded by drilling small holes in the side of the pattern and putting small wires from one to the other, and filling in between with melted lead and then putting a strip of brass the entire length of the patterns for flowing the metal; all small work should be carded, as this is a cheap way of molding small work.

Where a few small patterns are wanted, and wanted quickly, they can be made from one pound of zinc and one of tin; this is a good metal to finish.

PISTON-ROD FRICTION.—In a paper on "The Distribution of Internal Friction of Engines," read a few weeks ago before the American Society of Mechanical Engineers, Prof. Thurston, among other sources of loss of power from friction, referred naturally to the friction of the piston and its rod. He characterized it as a decidedly variable fraction, varying not only with the class of engine, but also in the same engine when differently handled. It is not surprising that this should be so, especially when we consider the large variety of packings and packing rings with which the market is supplied, and the uncertain measure of tightness and protection against leakage afforded in the person of the average attendant. It has been remarked, facetiously, perhaps, but not wholly without foundation, that the first thing which a new engineer will do with an engine is to set out the packing rings, and that similarly this one unfailing remedy for any slight trouble with an engine is the same setting out of these rings. That the friction of a piston should be enormously increased by such tinkering with an engine is but natural, and instances are not unknown where machinery had become almost inoperative from this cause, the friction from unduly creased-down stuffing-boxes, moreover, adding to the difficulty. Under the circumstances, the unpacked pistons and rods, which are now gradually coming into use, are to be welcomed as important advances in engine construction.

THE RAPIDLY INCREASING USE OF IRON is alluded to by the Boston *Journal of Commerce* as follows, under the head of "An Unsolved Mystery": Iron, of all others, is the metal in most general use, and, unlike wood and other materials which "perish in the using," iron, when it has served its purpose in one position, goes to the foundry or forge as scrap iron and returns for some other use, as good as new, with very little loss. Old castings are recast in some new form, and are no way inferior to castings made of new pig iron. Old rails are re-rolled and come out new. It is only in the form of nails and some other small matters that iron is lost. Now when we observe the millions of tons of pig iron, fresh from the ore, that is added to the stock on hand every year, the mystery is that the demand still remains unsupplied. The constantly increasing use of iron in all its forms would account for the increased output from the furnace every year, if, like other materials, it perished with the first use; but as it returns to the common stock as new material, why is the demand still maintained?

SCIENTIFIC PROGRESS.

Why Does Lime Make Water Boil?

A cotemporary answers the above question somewhat at length as follows: The inquiry relates to an interesting fact, which everybody knows, but the explanation of which is based in a measure upon theories. Scientific men theorized upon the question, What is heat? until the realm of theory was well-nigh exhausted before they settled upon one which seemed satisfactory. The accepted theory now is that heat is motion or vibration. It is known that it is a force. It is explained to be the molecules of one substance or body acting upon the molecules of another.

A piece of iron may be hammered into a red glow, but it is the evolution of its latent heat, and the iron is made more solid by the hammering. Any substance, whether gaseous (exceptible of being solidified), liquid or other forms of matter, in the process of solidification throws off heat. Carbonic acid gas may, by tremendous pressure, have the heat squeezed out of it until it becomes a solid lump of ice, of such a low temperature that it will act on the hand that takes it up like a piece of hot iron. In proportion as the process of solidification is rapid, is the rapidity with which the heat is thrown off and its presence made apparent.

Every substance contains a greater or less amount of calorific or the principle of heat. Rapid chemical changes, produced by a strong affinity of two substances, evolve heat, but why, no one can explain, unless by the energetic action of the molecules of one upon those of the other, and this brings us to the subject of the query.

When lime is subjected to a calcining heat the carbonic acid it contained is driven off, and there is left what is called oxide of calcium, or caustic lime—called in common parlance "quicklime." This quicklime has a very great affinity for water, and if exposed to the air will gradually absorb the moisture from the atmosphere. The water combines chemically with the quicklime and becomes a solid. This mass dissolves slowly. The process in this case is so slow that the evolution of heat is not noticeable. The combination forms hydrate of lime, its constituents being calcium, oxygen and water. If the lump of quicklime is suddenly immersed in water, the former acts with great energy upon the fluid, absorbing a vast quantity, which immediately undergoes a chemical transformation and becomes solid. The theory is that the energy of this chemical action upon the water produces the heat which causes water to boil.

The Barometer and Colliery Explosions.

The record of a highly interesting series of experiments on the relations between barometric fluctuations and the appearance of fire-damp in collieries has been given by the Austrian engineer, Quaglio. A number of serious accidents had taken place at the Ostran and Karwin mines belonging to Archduke Albrecht of Austria. This caused him to give orders to his officers to conduct any experiments which might lead to methods enabling colliery managers to anticipate the dangers of such disasters. In June, 1885, a series of experiments was begun, which are being still continued, consisting of keeping an accurate record of the fluctuations shown by the barometer and daily analyses of the air in the mine of the Gabriela colliery at Karwin. The result of the comparison of these data was that the quantity of fire-damp increases, generally speaking, as the barometer falls, but that its development is not dependent upon a very low barometer.

Not content with this information, a novel experiment was tried. On the 20th of June work at the mine was stopped and the inlet shaft sealed, while the suction fan continued to work, this being kept up for 27 hours. The barometer in the mine sank $2\frac{1}{2}$ mm. Inside of five minutes, and the gas contents at the fan rose 83 per cent, and in the vicinity of the Carl seam, 40 per cent. During later experiments the barometer fell four mm., the fan ceased to work, and in one case the percentage of gas in the vicinity of the Carl seam rose 135 per cent.

So well convinced are mine-owners in that vicinity that explosions are more likely to occur during an unusual fall of the barometer than at other times, that orders have been given to a number of superintendents to suspend work and order every one out of the mine during any very unusual fall of the barometer. Experiments still in progress show that the quantity and intensity of explosive gases greatly increase as the degree of atmospheric pressure diminishes.

DANGERS IN GUN DISCHARGES.—There are two distinct periods in the discharge of a great gun during which damage may result to surrounding objects. When the projectile leaves the gun, it is followed by a volume of gas at a high tension and moving like the shot at a great velocity. This gas, expanding enormously, and moving at a high velocity at the same time, causes a violent blast, driving the air before it, and thus producing in its rear a partial vacuum. This blast, therefore, is the first element of destruction, and carries away everything movable in its path. The air rushing in from all sides to fill this vacuum produced by the blast causes a reaction—an object moved in one direction by

the blast would be moved in the opposite direction by the rush of air. This movement of air to restore equilibrium is very violent, and doors are hurst open from the inside, owing to the excess of pressure on that side. For this reason it is well, when possible, to leave all superstructure doors open, that there may be a free circulation of air, otherwise locks and hinges will be torn off and doors will open themselves.—*Engineer*, N. Y.

A PHYSICAL IMPOSSIBILITY.—Prof. Le Conte, in *Popular Science Monthly*, gives his views on the flying-machine question as follows: We must admit that a bird is an incomparable model of a flying machine. No machine that we may hope to devise, for the same weight of machine, fuel and directing brain, is half so effective. And yet, this machine, thus perfected through infinite ages by a ruthless process of natural selection, reaches its limit of weight at about 50 pounds! I said, "weight of machine, fuel and directing brain." Here is another prodigious advantage of the natural over the artificial machine. The flying animal is its own engineer; the flying machine must carry its engineer. The directing engineer in the former, the brain, is perhaps an ounce, and in the latter it is 150 pounds. The limit of the flying animal is 50 pounds. The smallest possible weight of a flying machine, with its necessary fuel and engineer, even without freight or passengers, could not be less than 300 or 400 pounds. Now, to complete the argument, put these three indisputable facts together: 1. There is no low limit of weight, certainly not much beyond 50 pounds, beyond which it is impossible for an animal to fly. Nature has reached this limit, and with her utmost effort has failed to pass it. 2. The animal machine is far more effective than any we may hope to make; therefore, the limit of the weight of a successful flying machine cannot be more than 50 pounds. 3. The weight of any machine constructed for flying, including fuel and engineer, cannot be less than 300 or 400 pounds. Is it not demonstrated that a true flying machine, self-raising, self-sustaining, self-propelling, is physically impossible?

PHILOSOPHY OF "THE LURCH BACKWARD."

The question has often been asked why passengers on cars "lurch backward" at the sudden stopping of a train, instead of forward as they always do on a steamboat which stops suddenly, as when a ferry steamer comes into its dock and strikes the pile with considerable force. The *Manufacturers' Gazetteer* explains the conundrum as follows: Passenger-car brakes are attached to the truck-frames, and the frames to wheels, axles and cars, through the medium of stiff springs. An application of the brakes tends to raise the rear end of a truck and depress the forward end. At the moment of actual stop the springs relieve themselves of the pressure put upon them, the truck regains its level position, and the car-wheel is revolved from one to six inches backward in a very short space of time. The backward movement of the wheel carries the car with it a corresponding distance, and the passengers, braced in a forward direction to resist the stopping action of the brakes, are "set back" by the "recoil," if it may be called by that name.

PHOTOGRAPHING THE EARTH'S SURFACE.

A wonderful device has just been invented by a Mr. Steffens, a Chicago photographer. Steffens' patent is for a device for sending a camera up above the earth about 2000 feet by means of little balloons, then steadying and focusing them, and making an exposure of a large section of the earth's surface by means of an electric wire. According to the plans, 48 exposures can be made at each ascension, the sensitized paper revolving upon a cylinder. It is estimated that at an elevation of 2000 feet, a region of 75 miles in diameter could be photographed with very satisfactory clearness.

THE EEL is a very singular fish, and one that has hitherto eluded the most thorough efforts of scientists to discover its spawning places. Fred Mather, the well-known fish culturist, has been making some very interesting experiments with the microscope which prove that there are 9,000,000 eggs in an eel. How and when these eggs are hatched has always been, and still is, a mystery. All that is known definitely is that the old eel runs down to salt water in October, and that in the spring swarms of young ones, the size of a darning-needle and about two inches long, ascend the rivers.

PROF. HUGHES has shown that a stranded iron wire cable has less self-induction than one of the same mass of metal formed into a solid wire. The explanation of this is that the circular field of magnetic force around the axis, which exists inside the wire as well as outside, is not as strong in the interior of the stranded iron cable as it is in the interior of the solid iron rod. The stranding reduces the magnetic permeability along lines which are circled and derolled around the axis, and hence reduces the self-induction.

A SCIENTIFIC SCHOOL was established at Timmen, Siberia, many years ago. It occupies the largest and finest building in the town. It has a mechanical department, thoroughly equipped with a steam engine, lathe and a great variety of machine and hand tools. When one remembers that Timmen is 1700 miles east of St. Petersburg, in the midst of a country in which according to popular belief little else is to be found besides snow, ice and exiles, the above statement is somewhat remarkable.

GOOD HEALTH.

Night-Air Superstition.

All our life, since we arrived at a fighting age, have we fought, in our home, in our office, everywhere, for fresh air and thorough ventilation throughout the whole 24 hours; and especially have we contended for plenty of fresh air during our hours of sleep. We have been met with all sorts of arguments against our views, but as they came, nearly always, from asthmatic or consumptive sources, we simply inhaled our lungs with more good sparkling ozone and smiled as we passed on. At about the half-century mark we are not, and never have been, afflicted with the slightest lung or vital trouble, and one or more windows are open in our sleeping rooms the whole of the year around.

One thought has been set at work in this direction by finding in one of our exchanges some remarks upon night-air superstition, which we propose to quote, in the hope that they may be of benefit to some one of the altogether too many who seem to fear the fresh air of heaven:

"A sensible doctor, who despises drug-cataloging, and realizes that health is only possible by conformity to Nature's simple but exacting laws, is quoted in an English paper as maintaining that the superstition that open night air is to be avoided has destroyed more victims than war and pestilence. This widely prevalent prejudice is worse than ignorance, just as poison is more fatal than hunger:

"That pulmonary consumption is not caused by cold outdoor air, but by foul indoor air, is a truth established by incontestable proofs. Statistics prove that north and south, east and west, in uplands and lowlands, the prevalence of respiratory disorders bear an exact proportion to the prevalence of indoor occupations. Experience, moreover, has demonstrated that for the radical cure of lung diseases, outdoor life in cold climate is more favorable than any mode of life in tropical climate. Horses and cows confined in stuffy stables are as liable to deadly pulmonary affections as their owners, while exposure to intense winter cold affects the respiratory apparatus less than any other part of the organism."

"By way of illustration, reference is made to the mane-baboon, which endures the night frosts of the Abyssinian highlands, at the elevation of 8000 feet above the coast plains of the Indian ocean, yet succumbs promptly to the influences of the foul though much warmer air of an ill-ventilated menagerie; and the following is added from an experience which has been repeatedly verified in cases personally known to us:

"I prefer the night-air cure. We cannot work under a load of furs. We cannot write with frost numbed hands. But with an adequate number of blankets, a bed exposed to the fresh air can be made perfectly comfortable. Use a nightcap or a shawl till habit has taught a way of keeping the blankets tucked up to the ears, leaving only the face uncovered—the plan of keeping the head cool and the feet warm being, by the way, the most effective specific for chronic insomnia. To the lungs pure, cold air is more grateful than impure, warm air. By the simple plan of opening a bedroom window, catarrh can be nipped in the bud by a removal of the cause—that is, by a direct elimination of the contagious germs."

There would be vastly fewer puny, pale, and gasping beings loitering around in this world, and there would be a great many less deaths from pulmonary causes, if humanity would conquer its too wide-spread aversion to fresh air.—*Our Society Journal.*

Vital Grit.

I have seen grit save many a life. I have had a patient who coolly said to me, "I will not die." I was compelled to assure her that she would. There was no hope for her. "Doctor," she answered, "you are a fool. I shall not die." Grit it was that carried her through.

A few years later she was sick again, and, as I thought, unto death, but there came the same all-conquering reply, "You are talking nonsense; I shall get well." And she did. This was repeated a third time, till I actually began to believe she would get well anyway at all times. It never occurred to me to think of her as liable to die.

Finally her mortal sickness came, and I expected to help her up as usual. But now she replied, "Doctor, you can come or go as you please; I am going to die; this is my last illness."

"Oh, no," I said, "we will have you out in a few days."

"Nonsense," she answered; "you are talking of what you know nothing about. I shall never be well again."

In two days she was dead. Her grit gave out; her pluck was good to the last. She had pluck enough to face death; she had no longer grit to endure disease.

There is no question that moral and mental grit go with physical to sustain vitality. A stout will wards off the blows of disease. In this case the patient went straight ahead to die without a flinch or whine. She had a vast faith in the "All Right," and allowed no one to dabble in theology at her bedside. She marched into the next life as she often had into the next year, and she had not a tremor. She

took her pluck with her. She treated a neighbor's prayers as she treated any medicine. "You can come if you like," she said, "or you can go. Your prayers can't stop me, and they can't change me—no more than the doctor's powders." She was a woman of extraordinary intelligence and determination.—*Dr. Maurice in St. Louis Republic.*

QUALITIES OF ALUM.—Alum is said to have power to purify water, and even to expel the bacteria it sometimes contains. That muddy water can be so cleared has long been known; but it is a comparatively recent discovery that a very small quantity of alum, so small that it is not injurious to drink the water that contains it, will rid the water of nearly all its bacteria. A Pennsylvania physician found that the water that was drawn by the people of a village where typhoid fever was epidemic was swarming with bacteria. Fifteen drops of it, when spread upon a suitable surface, were capable of forming 8100 colonies of these microscopic vegetable germs. He added alum, in the proportion of half a grain to a gallon, and found that not only were the earthy and vegetable matter precipitated, but that the colonies of bacteria were reduced from 8100 to 80, and these were of large size.

A NEW AND NOVEL REMEDY FOR POISONING. A curious and novel method of saving life in certain cases of poisoning has been originated by Dr. Carlo Sanquirico of Sionna. By largely increasing the volume of the blood, which can be done by injecting into the arteries saline solutions to the amount of about eight per cent of the weight of the animal, the poisons are actually rinsed out and eliminated from the system. In this way the lives of dogs and guinea-pigs were saved after being dosed with deadly amounts of strychnine, chloral, alcohol, aconitine, paraldehyde, caffeine and urethane. With certain other poisons, as morphine, curarine and nicotine, the method failed. It is not at all impossible that this discovery may introduce an improved treatment, not only for cases of poisoning, but for certain diseases.

REMEDY FOR BILIOUSNESS.—One of the best and simplest remedies for torpid liver or biliousness is a glass of hot water with the juice of half a lemon squeezed in it, but no sugar, night and morning. A person to whom this was recommended tried it, and found himself better almost immediately. His daily headaches, which medicine had failed to cure, left him; his appetite improved, and he gained several pounds within a few weeks. This is so simple a remedy that any person thus afflicted will do well to give it a trial, as it cannot possibly do any harm.

USEFUL INFORMATION.

Elastic Traces.

Foreign papers have recently directed attention to experiments which have been made in lightening the work of animals in drawing heavy loads by the use of elastic traces. It appears that some time ago M. Celler, Chief Engineer of Roads and Bridges in France, expressed a doubt whether the traces of leather or rope, or the iron chains, by which horses pull their load, could not advantageously be replaced by more elastic appliances, which would diminish the effort needed at starting to overcome the inertia of a heavy cart or omnibus.

Every one has noticed that a dray-horse is often obliged to use all his weight and strength to start a vehicle which moves along easily enough when once set in motion, and it is quite conceivable that springs in the harness might make the work easier by distributing the movement of starting over a longer period of time. Acting on M. Celler's suggestion, the directors of the Eastern railway of France began six years ago to harness all the horses employed in shifting freight cars at their Paris station with traces made of chains having a strong spiral spring inserted in them. A large number of horses is employed in this service at the station, and the effect of the change has been very satisfactory.

A considerable gain has been made in the durability of the harness and the regularity of the work, through the diminution of the number of chains broken in the service, while the horses have done their work better and with less fatigue. The blow of the collar on the shoulders at starting is far less violent, and less injurious to the animal, than under the old system, and the horses, finding that a strong, continued pressure will effect as much as the jerk which was formerly necessary, seem to gain courage, and pull steadily and directly, instead of wasting their strength in ineffectual plunges. During the six years of trial the directors of the company have become so convinced of the superiority of the new mode of harnessing that it has been adopted in all portions of the vast network of lines under their control.

AN ANCIENT MATCHLOCK.—A curious Tibetan musket or matchlock has found its way from Sikim, where it was picked up after a battle, to Calcutta. It is described in the Indian papers as of primitive design, although comparatively new. It is a smooth-bore muzzle-loader, mounted on a long narrow stock. The barrel is fitted with a double prolonged rest, the points of which are sharply shod so

that the rest itself may either be placed firmly in the ground or need, if necessary, as a hayonet. The contrivance is ingenious and the weapon is not altogether to be despised. Attached to it is a belt, on which are strung six hollow wooden plugs for powder charges and a small horn for priming powder. The workmanship of the whole is very rough, and there is scarcely any attempt at ornamentation.

FLOUR FROM CORNSTALKS.—Cornstalks are the most recent vegetable production from which flour is derived. The other day, heechwood was credited with a similar yield. The inventor, whose name is given as "Dennis," and who is an acquaintance of the editor of the Indianapolis *Millstone*, claims that "there is a hulk equal to one fourth that of the stock (stalk) stripped of its fodder, which is equal in quality to the best winter-wheat clear flour." The process of eliminating the new product requires the cutting off of about ten inches of the lower end of the stalk, which is hither. The leaves are stripped off next, and the stalk cut into pieces half an inch long. These are thrown into machines which beat them to a pulp, and this is subjected to the ordinary methods of separation. From the solid portions which remain—the outer covering of the stalk and the hair-like fiber of the interior—the flour is evolved and subsequently separated by bolting. The inventor believes that he stands "in the position of one who will reduce the value of the wheat crop in this country fully one-half."

HOW TO MEASURE A MILE.—It is often convenient to know, approximately, the distance between localities not far apart. This can easily be done in the following manner: Wrap a stout string around the rim of a carriage or wagon wheel, drive slowly over the distance, and count the number of revolutions which the wheel makes. A mile is 63,330 inches. Now measure the circumference of your wheel, and by a little simple calculation you may learn the distance you have traveled. Again, we will suppose that a wheel is 160 inches in circumference, and in going to the postoffice it made 900 revolutions; now, 160 multiplied by 900 revolutions will show the distance to be 144,000 inches; divide this by 63,360 and the quotient (distance) will be 2 miles and 17,280 inches, and this divided by 12 inches in a foot will give 1440 feet, and this divided by 16½ feet in a rod will show 87 rods, or 7 morn than a quarter of a mile, or a total of 2¼ miles and 7 rods.

ARTIFICIAL CULTIVATION OF SPONGES.—An industry in artificial cultivation of sponges is in process of creation. M. Oscar Schmidt, professor at the University Gratz in Styria, has invented a method by which pieces of living sponges are broken off and planted in a favorable spot. From very small cuttings of this kind Prof. Schmidt has obtained large sponges in the course of three years at a very small expense. One of his experiments gave the result that the cultivation of 4000 sponges had not cost more than 225 francs, including the interest for three years on the capital expended. The Austro-Hungarian Government has been so much struck with the importance of these experiments that it has officially authorized the protection of this new industry on the coast of Dalmatia.

A NEW USE FOR SALMON REFUSE.—The refining of lubricating oils from salmon refuse, which was commenced months ago on a small island near the mouth of the river, has been attended with much success. According to the law, the canneries are prohibited from throwing away the salmon refuse as long as a refinery is in working order and can use the refuse. In this way the refiners have an opportunity of securing material at a very small cost, and the only real expense is in extracting and refining the oil. So far this season 2000 gallons have been refined, and 3000 gallons more will be made before the season closes. Had the salmon run been good this year, these figures would have been doubled or trebled. Two grades of oil are refined and both are admitted to be fine lubricators.—*Westminster, B. C., Columbian.*

VEGETABLE WOOL AND SILK.—The Buenos Ayres *Herald* claims to have examined the fiber made from the reeds and rushes of the lowlands of the Parana, and that the textiles manufactured therefrom are undistinguishable from those made from wool and silk. Blankets, heavy goods for men's wear, feltings and "black-silk" dress goods are all manufactured from this fiber, and are said to be unrivaled for texture, finish, color and durability. Paper pulp is also made from these reeds and rushes, the manner of utilizing them being the invention of Mr. Newman.

OIL SPOTS ON WALL PAPER caused by persons leaning their heads against walls may be removed by making a paste of fuller's earth and cold water and laying some gently on the surface to be cleaned, leaving it until dry, when it may be brushed off and the spot will have disappeared. It works best on plain paper, but it does not succeed so well on thoroughly colored.

BRAINS IN TANNING.—The Indians tan buffalo-skins with brains, and as an evidence that they use more brains in tanning than many of their white brethren they tan only when a "prophet" assures them that the business will be remunerative.

ENGINEERING NOTES.

The Canal of Joseph.

How many of the engineering works of the nineteenth century will there be in existence in the year 6000? Very few, we fear, and still fewer those that will continue in that far-off age to serve a useful purpose. Yet there is at least one great undertaking, conceived and executed by an engineer, which during the space of 4000 years has never ceased its office, and on which the life of a fertile province absolutely depends to-day. We refer to the Bahr Jousuf—the canal of Joseph—built, according to tradition, by the son of Jacob, and which constitutes not the least of the many blessings he conferred on Egypt during the years of his prosperous rule. This canal took its rise from the Nile at Asint, and ran nearly parallel with it for nearly 250 miles, creeping along under the western cliffs of the Nile valley with many a bend and winding, until at length it gained an eminence, as compared with the river-bed, which enabled it to turn westward through a narrow pass and enter a district which was otherwise shut off from the fertilizing floods on which all vegetation in Egypt depends.

The northern end stood 17 feet above low Nile, while at the southern end it was at an equal elevation with the river. Through this cut ran a perennial stream which watered a province named the Fayoum, endowing it with fertility and supporting a large population. In the time of the annual flood a great part of the canal was under water, and then the river's current would rush in a more direct course into the past, carrying with it the rich silt which takes the place of manure, and keep the soil in a state of constant productivity.

All this, with the exception of the tradition that Joseph built the canal, can be verified to-day, and is not mere supposition or rumor. Until eight years ago it was firmly believed that the design had always been limited to an irrigation scheme, larger no doubt than that now in operation, as shown by the traces of abandoned canals and by the slow aggregation of waste water which had accumulated in the Birket el Qaerun, but still essentially the same in character.

Many accounts have been written by Greek and Roman historians, such as Herodotus, Strabo, Mutianus and Pliny, and repeated in monkish legends or portrayed in the maps of the Middle Ages, which agreed with the folklore of the district. These tales explained that the canal dug by the ancient Israelite served to carry the surplus waters of the Nile into an extensive lake lying south of the Fayoum, and so large that it not only modified the climate, tempering the arid winds of the desert and converting them into balmy airs which nourished the vines and the olives into a fullness and a fragrance unknown in any part of the country, but also added to the good supply of the land such immense quantities of fish that the royal prerogative of the right of piscary at the great weir was valued at \$250,000 annually. This lake was said to be 450 miles round, and to be navigated by a fleet of vessels, while the whole circumference was the scene of industry and prosperity.—*Engineering.*

THE SIDEWHEEL FERRY-BOATS MUST GO.—Steamboat men say that the sidewheel ferry-boat will soon be a thing of the past, and boats with propellers at each end will supersede them. The new idea is indorsed by many shipbuilders, practical architects and marine engineers. The important advantage of the propeller is that it takes less room on the boat, gives greater speed on less consumption of fuel and can be easier handled, besides costing less. The shaft will run through the boat from end to end, with an average-sized propeller at bow and stern. The first boat of this pattern was designed by J. Shields Wilson and built at Newburgh, N. Y. It is 200 feet long, has triple-expansion engines with cylinders 18½, 27, and 42 inches in diameter, and improved steel boilers. The screw on the stern of the boat pushes the vessel ahead, while the one at the bow pulls. When a stop is required, the reversal of the propellers checks the boat very quickly. This boat is regarded with much interest by those interested in maritime affairs.

VON SCHMIDT'S DREDGERS IN BOSTON.—A company has been formed by New York and Boston capitalists for the purpose of dredging Charles river and reclaiming the adjacent Cambridge marshes. The dredgers to be used are those invented by Mr. Von Schmidt of this city. These machines take up the mud from the bed of the river and deposit the material on the shore by hydraulic pressure through iron pipes laid overland or across pontoons, and thus may be made to reclaim land a mile away.

HIGH RAILWAY SPEED.—The high railway speeds recently attained on several English roads show that where sufficient inducement offers, modern railway appliances are capable of approaching very closely to the apparent limit of one mile a minute.

A BUILDING in Chicago which weighs 20,000 tons and is 6 stories high is being lifted up 6 feet 5 inches. Several thousand screw jacks are used and it takes 300 men to work them. The average lift is 1 foot per day. The cost will be \$40,000.

Passing Events.

The tests of the water-power and electrical plant to run the big mill up on the Comstock have been very satisfactory. There will be changes in some minor details probably, but the general plan is successful. We shall soon have a detailed description of this plant.

There is much complaint among lead miners relative to the smuggling of lead ores into this country from Mexico. It is probable that Congress will very shortly take active steps to prevent this going on any further. Still very powerful railroad and smelting influences would rather have things remain as they are. There is money in this smuggling for some people on both sides of the border.

Preparations are being actively made by several scientific parties to properly observe the coming eclipse of the sun. Most of the parties will observe in California, but some will go to Nevada, thinking they are more sure of clear weather at this season.

In a few weeks a report on the alien ownership of mines in the Territories will be made to Congress. The matter is now being investigated thoroughly.

Smuggling Lead Ores.

For some months the attention of the lead miners of the United States has been turned to the Mexican border, where lead ores are being brought into this country without paying any duty. The question is a very important one to Western mining and smelting men. The traffic is carried on under a ruling of the Secretary of the Treasury to the effect that the duty, if any, is paid on the predominating metal in the ore. The silver ore comes in free of duty; so as long as the ore contains more in value in silver than lead, then the lead in it pays no duty. In this way large quantities of lead ore are coming in free, to the detriment of American lead-producers.

We had a conversation this week with Mr. Ivan C. Michels, Statistician of the Committee on Mines and Mining, U. S. Senate, who is on this coast engaged in investigation concerning alien ownership of mines. He spoke of this subject of smuggling of lead ores, it being one to which he has given considerable attention.

He says the smuggled lead ores come in by way of Nogales, Arizona Territory, Laredo, Texas and Eagle Pass, Texas. The lead ore is conveyed by one car of silver ore, say as one to nine—nine cars of lead ore to one car of high silver ore, under the direction and instruction of the Secretary of the Treasury. All of the ore having its chief value in silver, comes in free, no matter how much lead, copper or any other metal it contains.

"The ores from Mexico very often contain from 40 to 60 per cent of lead ore, and from 8 to 15 per cent of silver ore, on which freight, as well as 10 per cent loss, are charged against the lead ores. In this way all charges are made against the lead ore, none against the silver, thus reducing the value of lead ore materially, and correspondingly increasing the value of silver ore. They have erected two smelting works at Laredo, Texas, and one at Nogales, and the ores containing higher grades of lead and silver are shipped to Kansas City, Denver and Omaha for smelting. As much as 4000 tons of lead have been brought over or smuggled in in one month. The Mexican Government is very much opposed to this kind of smuggling, preferring to have the ores smelted in Mexico, and are anxious to sell the lead. They are willing to aid the United States Government to suppress this traffic. The Utah, Montana and Idaho lead miners are those who are enfeebling the most."

We called Mr. Michels' attention to a statement made by the *Denver Weekly Republican*, that the ruling of the Treasury Department upon the admission of silver-bearing lead ores free of duty had been brought to the attention of the Judiciary Committee of the Senate, of which Senator Edmunds is chairman, and that this committee reported that the ruling is in accordance with the statutes. Mr. Michels says: "The *Denver Republican* is in error about it. Senator Stewart of Nevada some time ago introduced a resolution in the Senate, asking why lead ores bearing silver ore come free. This resolution was referred to the Judiciary Committee, of which Senator Edmunds did not give an opinion as chairman of that committee, but addressed a letter to the Secretary of the Treasury asking his opinion. In response the Secretary of the Treasury wrote to Senator Edmunds informing him that the ruling of the department is, that lead ore containing silver ore of greater value than the lead ore shall be considered silver ore and be admitted free. This letter Senator Edmunds indorsed as his opinion also.

"It is decidedly not in accordance with the statutes. On the contrary, the United States statutes expressly provide that on ores not otherwise provided for in the metal schedule of the tariff, a duty of 20 per cent ad valorem shall be levied."

TRIAL of the suit of Washington Smith, one of the stockholders of the Kenton Mining Company, against Superintendent C. C. Stevenson and Wales L. Palmer, a stockholder of the corporation, was begun Tuesday before Judge Wallace.

THE quicksilver mine near Oakland, Oregon, is yielding 15 flasks per month. This is the only cinabar deposit on the coast now worked outside of California.

New Mining Patents.

Three improvements in mining appliances were patented through the MINING AND SCIENTIFIC PRESS Patent Agency during the past week, brief descriptions of which will be of interest to our readers. One of these, patented by Joshua Handy of this city and O. M. Lovbridge of Weaverville (assignor to Mr. Handy), is intended to increase the capacity of the ordinary

Hydraulic Nozzle.

In the ordinary nozzle used in hydraulic mining, the elbow is provided on its forward end with a ball having an exit opening. To the ball is pivoted by trunnions a flange or ring to which the flaring rear end of the nozzle-pipe is bolted, said flaring end thus fitting over the forward end of the ball and having an up and down movement about the trunnions as a center. A packing-ring bolted between the nozzle-pipe and flange makes a tight joint. The object being to increase the capacity of the apparatus, these inventors found that with the construction of the joint as described it would not answer to simply increase the diameter of the exit opening in the ball, which has heretofore been round, for in that case, as the pipe moves up and down, the packing-ring would be exposed. Therefore the diameter of the opening on the ball is limited, but as the pipe does not move sidewise on this joint, they have found that they can obtain the desired enlargement for increase of capacity by reaming or cutting backwardly the sides of the exit opening in the ball. Now, as the pipe does not move sidewise, these additional openings or recesses do not expose the packing-ring and the pipe may move up and down as before. By this improvement they have accomplished the necessary result and materially increased the capacity of the nozzle without interfering at all with the perfect construction of the joint itself.

Rock-Crusher.

The object of the invention of Joel B. Low of this city is to provide a simple and effective rock-crusher which is easily operated and adjusted, and which can be readily cleaned in all its parts, making it specially adapted for the use of assayers and for any small work where examples are desired. The patent covers, in a rock-breaker, a stationary jaw pivoted at its top in the frame so it may be turned up when released to an elevated position. There is a removable bolt or pin behind the stationary jaws for holding it in its working position and adapted to be placed in the frame in front of it to hold it when in an elevated position. The moving jaw is also pivoted at its top to the frame and is adapted to be turned up to an elevated position and rested against the other jaw. It being possible to thus throw the jaws up out of working position, the whole machine is easily cleaned, so that when a new sample is to be crushed there is not apt to be any of the crushed previous sample remaining, as is the case where the interior is difficult of access.

Lead-Bath Apparatus for Ores.

The patent of Andrew M. Shields of North Temescal, Alameda county, is for a lead-bath apparatus for working ores. In the employment of molten lead or other metal to recover precious metals from these ores or from sand with which they may be mixed, considerable difficulty has been experienced, first, from the large surface of lead which must be exposed to the atmosphere and the consequent loss by oxidation; secondly, in the difficulty of distributing the sand so that all parts will be exposed to the action of the metal; and, thirdly, in the difficulty of separating the sand from the lead and discharging it without carrying off a considerable quantity of the lead with it. This invention of Mr. Shields is designed to overcome these difficulties. The invention consists of a pan, the bottom of which stands on an incline, while the top is in a nearly horizontal plane, and, in combination with this pan a means for reducing the surface of melted lead exposed to the atmosphere, the means for feeding the molten metal and agitating it, together with a means for discharging the refuse from the top of the lead bath without carrying away the lead itself. Mr. Shields informs us that one of these machines has been working successfully on the beach sands at Monterey bay, and that they are specially adapted for saving the fine gold in beach sand.

THE Tucson Smelting Works have passed into the hands of the Pueblo Reduction Works Co.

Diamond-Pointed Rock Drills.

The Bullock Manufacturing Co. has purchased the rights to manufacture all the styles of rock drills made under original Leschot patents, and also a large number of patents granted to M. C. Bullock, which control the latest improvements in diamond-pointed rock drills. The advantages of diamond drills are thoroughly recognized and understood. The general principle of boring is the same in all the drills made by this company, though there are slight changes in design to meet special requirements. In boring artesian or oil-wells, or in prospecting at great depth, they use a pair of reciprocating engines with cross-heads and slide valves, and a single reversing device. For underground prospecting or boring short holes, peculiar trunk engines are used.

An engraving of one of these drills, called the Dauntless, is given on next page. It is a drill of this pattern which has been doing such good work prospecting in the coal measures at Saybrook, Ill. The diamond-pointed bit, or boring-tool, is mounted on a swivel head, which can be easily turned to bore in any desired direction, and is secured in position by simply tightening one nut. The feed screws are made of best lap-welded hydraulic tubing, from four to seven feet in length, with deep square threads cut on the outside. Each of these screws has a key-seat or spline cut the entire length, by which it is feathered to the bevel sleeve gear which drives it. This gear connects with a beveled driving gear on the crank shaft of the engine which gives it a high rotative speed. On the sleeve of this gear are three spur feed gears which engage and drive three others on a small counter shaft; at the lower end of the latter is keyed a spur gear, and this in turn engages with and drives another gear, which is keyed to the cast-steel feed nut of the machine. These feed gears have a difference of one or more teeth, giving a differential feed with three combinations.

The counter-shaft is hollow and is fitted with a sliding rod having a clutch which can be set to engage with either of the three feed gears carried on the upper end of the shaft. The lower end of this clutch rod is secured to a sliding handle with detent, so arranged that the operator can shift the clutch from one feed gear to another while the machine is running, thus changing from a coarse to a fine feed, or vice versa, and adapting the cut of the bit to the hardness of the rock. The thrust of the bit upon the feed nut is received by a hardened steel conical roller-thrust bearing, which is held in place by a steel yoke resting upon two hydraulic pistons. These pistons are connected with a pressure gauge on the swivel head, which indicates the pressure of the bit against the rock. At the lower end of the feed screw is secured a chuck, through both of which pass the drill rods. The core barrel which carries the bit and core lifter is secured to the lower end of the drill rods, and on the upper end of these rods is a water joint connected to the feed pump by rubber hose. With this pump a constant stream of water is forced down through the hollow drill rods, keeping the bit cool and washing the cuttings up to the surface on the outside of the rods. The hollow bit is a steel thimble having two rows of diamonds (bort or carbon) so embedded therein that their edges project from its face, and from the outer and inner periphery. The diamonds in the face cut the path of the drill in its forward progress, while the outer and inner projections enlarge the cavity and allow the free passage of the water as above described. As the feed screw is rotated and fed forward, it turns the drill rods and bit and thrusts the bit into the rock, cutting an annular channel. That portion of the stone encircled by this channel is undisturbed, and the core barrel passing down over it preserves it intact. When the rods are withdrawn the solid cylinder thus formed is brought up with them. When a core is not required, another boring head can be used. The feed screw is made to run up 60 times faster than it is fed down. The agents for these machines on this coast are Parke & Lacy.

DURING the past year Spokane Falls, W. T., has enjoyed a first-class boom. More than \$2,000,000 has been spent in buildings, and \$224,000 has been paid out for street improvements. The city is equipped with three systems of street cars.

Concrete.

Ransome's Process.

Ransome's stone has for many years borne a familiar sound to the ears of this writer. During a lifetime Mr. Frederick Ransome, the father of Mr. Ernest L. Ransome of this city, whose process I propose to deal with in this article, has given unremitting and toilsome attention, in conjunction with Mr. Ernest Ransome, his son, Mr. Henry Bessemer and other inventors, to the production of an artificial building-stone which has almost rivaled Nature herself. In London, Calcutta, Hongkong, and I may say in the majority of British Colonial settlements, the patents of Mr. Ransome have been practically tested, and for structural and decorative purposes they are unexcelled.

In 1873, Dr. Sterry Hunt, professor of geology in Boston, said before the Institute of Technology that "he had followed with the more interest the labors of Mr. Frederick Ransome, who, after years of experiment, had solved satisfactorily and completely a great industrial problem—with the more interest because he himself had carried on, in 1857-8, a series of experiments very similar in character and in chemical results, in his endeavors to find out the method by which certain soft earthy rocks, consisting in great part of silica and carbonate of lime, have become hard and crystalline." The speaker had shown by researches in the laboratory, and also by observations of limestone strata in the vicinity of eruptive rocks, that a reaction between the silica and carbonate of lime takes place in the presence of carbonate of soda, by which the alkali brought about, little by little, the solution of the silica and its union with the lime to form a hard silicate of lime. This is Nature's method. Too action of alkali in dissolving the silica and then giving it up to the lime, was an example of many of the so-called actions by presence, which are really cases of chemical affinity, acting under peculiar conditions. It was reserved for Mr. Ransome, by using both the lime and the silica in their free, soluble and active forms, and by bringing in the alkali already combined with a portion of silica, to make this curious action very rapid, and to show that the product forms a cementing material which is available for binding particles of sand into hard, stonelike masses.

Here we come to the secret of the hardening of cements—the small amount of alkali used by Mr. Ransome in the process itself, united with the successive portions of silicates of lime formed, thus becoming locked in an insoluble compound, as we see every day in granite rocks. It is a generally accepted view at the present time that the hardening of hydraulic and Portland cements is in a great measure due to the transferring power of a small portion of alkali which such cements are found to contain.

The application of Fuchs' invention made nearly 70 years ago, of the adhesive compound of alkali and silica, called "water glass," was the next step in the evolution of artificial stone, Mr. Ransome making it available by the discovery of chloride of calcium as a fixing agent.

The next step was to use such materials for cement as would themselves become insoluble, and require no after-treatment with chemicals. This was effected by adding to the ingredients hydraulic lime and active silica, the silica being in time transferred through the agency of the alkali to the unsaturated base of the hydraulic lime, while soda itself unites with the silicates of lime to form an insoluble double silicate of lime and soda.

We have here a double advantage: First, the richness of the material in combined silica as an admirable addition to its resistance to atmospheric and abrading influences; and second, the acceleration of the hardening process to a few hours by the use of water glass.

As regards strength, this stone was proved to resist a crushing force of 9000 pounds to the square inch. Dicks were also made of the material, which were used as millstones and grindstones. Combined with emery, the artificial stone when made into a disk for saw-sharpening would, when only one fourth inch thick, cut a saw-blade an eighth of an inch thick at the rate of six inches per minute.

"Ransome's hydraulic cement," composed of furnace slag (which consists of silica, alumina and lime), was an outcome of the discovery made by Mr. Charles Wood of the Tess Iron Works, who in the year 1873 obtained a patent for granulating the previous refractory slag by running it into water. The analysis of slag was: Silica, 38.25; alumina, 22.19; lime, 31.56; magnesia, 4.14; calcic sulphide, 2.95; and protoxide of iron, .91. An especial advantage derived from the use of slag sand in the manufacture of cements is the avoidance of the usual severe burning. It is admirably adapted for use in the construction of fireproof concrete.

The concluding portion of this article will consist of a description of the means taken and the process adopted by Mr. Ernest L. Ransome of this city in his concrete constructions. The discovery of the safe and effectual combination of iron and concrete has promised such great and beneficial results to the building world—the safety from fire, from rust, and its cheapness and lightness—that prejudice against, and ignorance of, its merits can have the sympathy of no intelligent man.

Mr. Ernest Ransome has taken out many patents during late years through the MINING AND SCIENTIFIC PRESS Patent department, and has

done much to further the practical development of concrete constructions on this coast.

The first and most important desideratum in the manufacture of concrete is the securing of a proper mixing of the aggregates and Portland cement. Drawings accompany the present description of his process. In two of them we have the "mixers," which he has found most

to see the thorough manner in which the mixing was accomplished.

With simple horse-power, three men and a boy can turn out 1700 cubic feet in one working day. The machine can be had for hire, so that the cost of purchasing is converted into a charge of \$2 per day to the hirer.

In Fig. 2 is seen an improved mixer which is

THE "DAUNTLESS" DIAMOND DRILL.

useful, and on which he has obtained patents. Without a proper machine, the work cannot be thoroughly and cheaply accomplished.

The cubical iron box in Fig. 1 of the accompanying engravings is partly filled with the cement and aggregates, the cement being of the finest quality and ground to a very fine powder so that it shall come in complete contact with

so constructed that its motion is a continuously revolving one (the cubical box necessitates a constant opening and shutting of the door in its side for the purpose of filling and emptying it). The power is derived from a small steam engine. At the side presented toward us can be seen the scoop by means of which the ingredients are carried into the revolving wheel.

Fig. 1.—CUBICAL BOX MIXER.

Fig. 2.—CONTINUOUS MIXER FOR CEMENT.

every portion of sand and broken rock; 640 to the square inch is the size of the mesh which grades English Portland cements. The Germans are grinding a poorer cement even finer, and as a consequence some brands from that country are making good headway in the market.

Water is admitted to the cubical iron box through the axle; for this hollow axle Mr. Ransome secured the patent. Six of these machines are being run by steam-power for the purpose of mixing the concrete as used in the dam for the new Spring Valley reservoir. Mr. H. Schnesler says that they have given the utmost satisfaction, and the writer was lately enabled

to see the thorough manner in which the mixing was accomplished.

Mr. Ransome has given much attention to the construction of a cheap and secure pavement, arched over a cellar or otherwise, especially important in a city like San Francisco, where in many places of its business portions large cellars are much in request, and where the amount of goods recklessly piled up on the sidewalks must amount to many tons.

There are two patents for this also. In the first the arch forms the pavement, the joint being over the iron beams, the surface marked with artificial flags. In the second, there is a joint especially adapted to allow for settlement; on either side of the upper portion of the beam there is left a small space, and adjoining this girder a recess is formed in the pavement. This latter can be filled in when the pavement has settled, and as it is uniform with the marking of the pavement, it is imperceptible.

Well Construction.

In contriving a simple mold for the walling up of a well with concrete, Mr. Ransome has met a long-felt want. The cleanliness and lasting power of a well so constructed are advantages which, were the cost greater instead of less than bricks, can be appreciated by the most inexperienced.

The woodwork of the mold is so arranged that any carpenter can put it together in two days, even though it be for a reservoir 50 feet in diameter.

It will last an indefinite time, and the small amount of iron used in its construction costs less than \$20. The mold, of which a drawing is given, can also be changed from one size to another.

The latest patent applied for by Mr. Ransome was that of imbedding twisted iron bars in concrete. It is now an established fact, and, strange to say, a newly discovered one by Mr. Ransome, that an iron bar when twisted without heating is increased in strength upward of 30 per cent. In this last patent there is a great improvement upon Mr. Hyatt's invention, where the bars or blades were perforated at every few inches, and anchored by short rods or wires threaded through the holes, which latter would tend to weaken them—a further disadvantage being the difficulty of making it perfectly fireproof.

Mr. G. W. Peroy, in a paper read before the Technical Society of the Pacific Coast, said that while Mr. Jackson's late experiments in the strength of iron and concrete were being conducted, "Mr. E. C. Ransome, also a member of this society, and a very successful maker of concrete, was experimenting with a different method for the purpose of obtaining the same result."

"For several years he had used old wire cables as a band in concrete walls, the irregularity of the wire ropes, caused by the twist of the strands, preventing the possibility of slipping when imbedded in concrete. This probably suggested to his mind the idea of twisting square bars of iron or steel and imbedding them in the bottom of concrete girders or flat slabs."

"It was evident that this method would be a great improvement over that invented by Mr. Hyatt. The twist in the bar would cause it to be held securely at every point along its length, instead of at intervals of several inches; no metal would be lost by punching holes, and no extra iron required for anchors. The labor of twisting cold rods would be but a trifle, and the entire sectional area of the iron could be placed just where it would be most effective."

"Mr. Ransome promptly patented his improvement, and since 1885 it has been used quite extensively in this city."

For withstanding dampness, concrete is admirably adapted; for withstanding heat and fire, even better. The comparative expansion on the application of heat to iron and concrete is: For iron, .0014; for concrete, .00137, at 180°.

Iron and concrete can be used together without any ill results from the deflection of the former or the rigidity of the latter. The most intense heat has no effect in destroying that homogeneity.

I may add, for the information of those who desire more practical information on the subject, that Mr. Ransome's fireproof construction can be seen in the following places:

Masonic hall, Crown Mills and Insane asylum, Stockton; Brown & Wise's large wine cellar, St. Helena; also, the following buildings in San Francisco: Sub-Treasury, Union Iron Works, Riedon Iron Works, Fulton Iron Works, Starr & Co.'s large Flour Mill at Port Costa, Arctic Oil Works, Bank of California, building corner Stockton and Washington streets, Starr King building, Langley & Michaels' building, Sheldon building, Wells, Fargo & Co.'s new building, Commercial wire Works, Light Works and California Wire Works.

WM. G. HODSON.

Fig. 3.—MOLD FOR CONCRETE IN WELLS.

Within this wheel are a series of hinged iron plates which are connected with the machinery so that a flapping and scooping motion is constantly kept up. By a simple device the motion of these plates can be reversed so that their motion backward and forward within the revolving wheel contributes to a thorough and even mixing of the materials. These, when mixed, come out in a ready flow at the other side, ready for wheeling away for immediate use.

The machine is made of different sizes, from an output of 1000 to 15,000 cubic feet per day with from three to six men.

MECHANICS' INSTITUTE LECTURES.—At a meeting this week of the trustees of the Mechanics' Institute, a communication from President Horace Davis of the University of California was read. In it Mr. Davis suggested that a course of 16 lectures should be given by four professors of the University—Prof. B. Moses, four lectures on American History; Prof. Wright, four lectures on American Literature; Prof. Joseph Le Conte, four lectures on Geology; and Prof. John Le Conte, four lectures on Light. After some discussion, the matter was referred to the Lecture Committee.

Labor Organizations.

A Much-Needed New Departure Originated.

The labor problem is one of the most difficult and important of any with which this country has to deal. It has been discussed by able and well-meaning men from all points, and by those occupying various positions in life; and yet the whole question still remains as much in doubt as ever. It is truly a many-sided subject, with good reasons to urge all around.

We believe in the progression and elevation of the laboring man. He is entitled to every reasonable consideration and advantage compatible with the existence of the conditions of laborer and employer. These are conditions which can never be wiped out. Under them it must be evident to every thinking mind that those who class themselves as laborers—as workingmen—are the ones who can least afford to place themselves in needless antagonism with capital. Hence it is to be regretted that such an open and bitter hostility should exist between the two classes as has been growing up within the last three or four years.

The Mistakes of the Past.

There is no objection to labor organizations. They are perfectly right and proper when properly conducted, and should be sustained; but it has ever been found a difficult matter to organize large masses of human beings for any purpose in a short time, even when officered by the very best of men. Hence it is not to be wondered at that the attempt to organize and put in active operation from a half to three-quarters of a million of men, scattered through almost every State and large town in the Union, should meet with grave difficulties. The rank and file, as a general thing, were inexperienced and uneducated in matters of comprehensive organization, and it was perfectly natural that among the leaders should be found many who were reckless and ambitious, and who, in entering upon an aggressive warfare, should, by their incompetence and lack of judgment, lead the organizations into mistakes and disaster. Such, unfortunately, for both the laborer and employer, has been the result. There is no occasion to enter into details in this matter. The facts are known and read by all. The uncalled-for and unnecessary strikes of the past two years; the terrible sufferings which they have imposed upon thousands of families; the stopping of the wheels of commerce suddenly and without notice; the great damage to the public at large, which has fallen with far greater force upon labor than upon capital; the forcing of men with families to stop work against their will and interests, are things which cannot be tolerated in a free Government, where each is so dependent upon the other in the performance of needful labor and social duties.

The great body of the workingmen of this country may be misled for a time by reckless leaders, but they have sufficient intelligence and patriotism to soon get their eyes open, and on the second sober thought, to strike out for the right. This has been the result of the mistakes of the last two years, and now these reckless leaders are being sent to the rear all along the line, while their places are being filled with men of better judgment, who think more and talk less.

The Labor Convention at Indianapolis

Which recently adjourned, as the representative body of the Knights of Labor, has fully vindicated the honor and intelligence of the American working people in sustaining General Master Workman Powderly in his honest and earnest endeavor to secure a just and honorable administration of the affairs of the organization of which he has long been the head. Notwithstanding the most determined efforts on the part of the reckless minority opposed to him, he has most signally triumphed over his opponents and has been fully established in his position as head of the Order for another term, with the added privilege of henceforth choosing his own cabinet advisers. His chief opponent and late lieutenant, Thomas Barry of Michigan, has been ignominiously expelled from the Order by a decided vote of 123 to 24. On its being ascertained that, owing to the troubles and consequent falling off of membership of the K. of L., that body was in some pecuniary straits, the representatives of the Glass Workers' Assembly of Pennsylvania, the wealthiest, most conservative and most influential local

labor organization in the country, promptly came forward and offered all the money that was necessary to carry on the affairs of the Knights of Labor, to the extent of \$100,000. This offer was promptly accepted, and as the organization is now placed upon a sound financial basis, it is to be hoped that it may soon be also permanently established as a thoroughly useful and beneficial Order. To accomplish this end, some modifications in the rules and practice of the Order have been adopted.

The K. of L. as It Was and Is to Be.

The organization of the Knights of Labor, from whose past misdirected influence so much of evil has been experienced, and from whose future action so much of good may be expected, was formed some eight years ago for the purpose of obviating strikes by the adoption of some means of arbitration as a plan for settling disputes about wages, hours of labor, etc. So beneficial an object naturally commended itself to the approval not only of the workingmen throughout the country, but of employers as well. The Order grew rapidly and soon attained a membership of fully 800,000. The great mistake of the organization grew out of the fact that no power was lodged in the central body to control local assemblies, more particularly in the matter of strikes. Consequently strikes, in many cases, were ordered instead of being averted. Arbitration was about as often declined as courted, at least until the mischief of an unnecessary strike and all its concomitant evils were set on foot. The intervention of Master Workman Powderly pleading for a more loyal adherence to the organic principles of the Order was disregarded and often contemptuously spurned by some of the more reckless managers of the local organizations. The natural consequence was a long and bitter series of conflicts between both labor and capital, and between the local and central organizations of the Order. As a result of these differences, the Order became badly demoralized and with a depleted treasury, the membership fell off in about 18 months from 800,000 to less than half that number. The trouble first took tangible shape at the General Assembly held a year ago in Richmond, Va., and finally culminated at Indianapolis, where Mr. Powderly, who, as much as any man in the country, holds the welfare of the wage-worker at heart, has made a complete triumph over his own and the workingmen's most dangerous and persistent enemies. It is to be hoped that since the organization has now been thoroughly purged of the disaffected and reckless element in its leadership, it will soon regain the most of its lost membership and hereafter exert a healthful and highly beneficial influence over the general labor organizations of the country.

ZELLERBACH'S SUIT.—After a trial lasting over two months, the jury in the case of Mark Zellerbach against M. Allenberg and E. L. Goldstein has returned a unanimous verdict for the defendants on each of the 74 special issues on which the case had been presented to them. The case involved the title to mining property valued at several million dollars, which has been in litigation for many years. Allenberg was formerly the confidential agent and manager for Zellerbach, and it was charged in the complaint that he sold the products of the mine and gave the money to Goldstein, who in turn loaned the money to Zellerbach on his mining property. When the loans became due, Zellerbach's property was attached and was bought in by Allenberg and Goldstein. He charged that his former agent Allenberg conspired with Goldstein to defraud him, but the jury found that there was no foundation for the charge of fraud.

MINING COMPANIES SUED.—P. J. Kenna, as a stockholder in several companies, has brought suit to recover \$1000 in each case against the directors of the Mount Diablo Mill and Mining Company, of the Chollar Mining Company, and also of the Potosi Mining Company, for failure to publicly post the monthly financial transactions, as required by law.

THE State Mining Bureau Museum has been the recipient of a present of a large collection of shells from J. Z. Davis. The shells are from the seacoasts of various countries, and there are several thousands of them. Among other additions to the museum is a box of Toltec mummies from New Mexico.

Coast Industrial Notes.

CALIFORNIA OIL.—A Pennsylvania oil expert says: There is more oil under the soil of California than in all of Pennsylvania.

DREDDING OAKLAND HARBOR.—Active work will soon be once more commenced in dredging Oakland harbor. The sum of \$350,000 is the amount of the present appropriation.

BRICKLAYERS SCARCE.—It being impossible to find bricklayers out of employment on the Pacific Coast, the contractor for the new public building at Carson imported his force from the East.

ALAMEDA SALT WORKS.—The U. P. Salt Works at Mount Eden, Alameda county, are loading from two to three schooners a day with salt, of which they have now about 20,000 tons on the grounds.

ICE MEN all along the Truckee river are now prepared for their winter harvest. Several of the companies have enlarged their storage capacities. The new ice-house at Essex is about completed, as is also the additional one at Ouba.

A NEW V FLUME IN EL DORADO.—A surveying party is now at work a little northeast of Placerville, and it is reported that they are laying out a line for a V flume to convey the waters of Silver creek to Folsom, for the purpose of floating wood, etc.

BOX FACTORY AT VERDI.—O. Lonkey has commenced the construction of a box factory at Verdi. It will be one of the largest on the Truckee river, and give employment to a large number of hands, adding much life to this already wide-awake and prosperous camp.

STEEL SUPERSEDING IRON.—Eight hundred tons of American steel rails, which recently arrived from New York for the Southern Pacific Company, are being forwarded to the Roseburg division of the Oregon and California Railroad, and enough more are coming on three ships to replace all the iron rails on the road, and give a continuous steel rail from Portland to San Francisco.

NEW FOUNDRY IN NEVADA.—Wm. H. Martin, Robert Martin and Dave Muir, Jr., have commenced the construction of a foundry and machine shop at this city. The site selected is the Stiles lot on Spring street, in the rear of the Methodist church. The engine, tools, etc., have been ordered and will soon arrive. The company will make a specialty of furnishing mining machinery, so says the Nevada Transcript.

REMOVAL OF DUNCAN'S MILLS.—These mills have recently passed into the hands of a syndicate, and it is now in contemplation to remove them to Petaluma, that being the most favorable point on the line of water navigation with San Francisco. There everything could be utilized. Sawdust, slabs and oil refuse stuff could be made to pay a profit. It is believed that this arrangement will be accomplished in the near future.

FLOURISHING.—Rocklin, Placer county, is a lively town, according to the Sacramento Bee. The two hotels there are crowded every night and another hotel is in process of erection. At Rocklin, they are getting out the granite for the new courthouse at Stockton, and the contract caused the employment of one hundred additional quarrymen. All the towns in Placer county, along the line of the Central Pacific Railroad, seem to be flourishing.

SHIPPING HOUSES FROM THE EAST.—Several houses, all ready made, and only needing to be put together, have recently been received at Los Angeles from the East. This is a somewhat suggestive matter. Our lumbermen must be prepared to compete with the lumbermen of the Northwest, or their occupation will be seriously interfered with. Just now, lumber is very low, so low, in all probability, as to preclude any such further importations. It should be noticed that labor is also an important factor in this new business venture.

BORATE OF LIME.—It has long been known that a deposit of borate of lime existed in Curry county, Oregon, but it has only quite recently been known that it was of vast extent. The deposit is a dry one, in a bluff directly upon the ocean shore, and in a locality very convenient for shipment. The deposit, it is said, has been traced for half a mile, and is 300 feet wide and 30 feet deep. If the accounts of this discovery are to be relied upon, this is the most valuable deposit of this kind on the Pacific Coast, or anywhere else, in fact. The convenience for shipment is an important factor in connection with this discovery.

THERE seems to be an unusual activity manifested just at this time in all the various industries. The old works are being enlarged, and new industries being established all through the State. There is the promise of a larger influx of visitors from the East this coming season than has ever before been known, and a much larger portion are coming to stay. The present outlook for California is most especially encouraging. The recent election registration and the vote cast has developed a much larger population in

the State than had been supposed to exist here. The same is true of the country at large. The latest estimates are that the next census will reach very nearly 70,000,000. This would give an increase of nearly 20,000,000 in ten years.

ERECTING THE PLANING-MILL AT BERKELEY. Preparations are being made in West Berkeley for the erection of some large planing mills. Nichols & Co. will be the owners. A lot directly upon the water-front has been graded and a bulkhead is now being built to prevent the sea from washing away the earth. The mill will be 100x125 feet and two stories high. A floor made of concrete, eight inches thick, will be laid, and the latest improvements in machinery will be made to the mill they now are running. It is also their intention to build a wharf for the accommodation of their business.

THE CANNERS.—There are indications that the canners are about to suffer a raid from a patentee of the soldering process which is universally used for closing cans. It is said that the royalties in prospect amount to \$50,000,000, and one may expect a repetition of the scenes which attended the enforcement of the Good-year rubber patents. This fear comes from a verdict rendered on the 22d of last month in Boston by a jury in the United States Circuit Court, said to involve the collection of millions of dollars in royalties annually from the canners of fruit, salmon and other commodities in the United States for the use of soldering iron. The case was made a test. The verdict was at the rate of \$187.50 per 1000 cans on which the soldering iron was used by the defendant. This decision, it is said, will open the way to suits against a majority of the fruit canners of the country.

REDUCTION WORKS IN SAN DIEGO.—According to the National City Record, all the machinery has been received for the establishment of Reduction Works at National City, and the works have been started. The building contains four floors, and the ore, which is deposited on the upper floor, passes, during the different stages of the process of reduction, successively downward to the lower floors, until the refuse reaches the vast dumping-grounds in the rear of the establishment. An invoice of ore has been received from San Bernardino county, and contracts have been made with a number of other parties for supplies of ore, which will follow in intervals so as to keep the Reduction Works busy continuously for many months to come. The handling of the ore, the operation of the machinery and other work connected with this establishment, give employment to over one hundred men right along, and when the large refinery, with its big smelters, scales and furnaces, which will immediately be built, in connection with these works, is completed, the number of employes will at least be doubled, and National City will have one of the completest plants of its kind in existence.

BOLT MAKING IN SAN FRANCISCO.—Nearly fifty people are employed in a local bolt factory on Mission street. Bolt-making, says a contemporary, as a distinct industry has attracted little attention here that there are doubtless many persons in this city who have never before heard of the existence of such an establishment in San Francisco. But although quietly conducted, the works are really of great importance, and they add another proof of San Francisco's advance in the industrial world. The establishment was founded in 1871, when everything in the line of bolts was obtained from abroad. Success has attended the efforts of the manufacturers, although at the start it was dearly won, as outside competition was strong. The products of the works have for some years past been supplying the local trade, and have also been shipped as far East as Utah and adjoining Territories. They have also been sent to the islands of the Pacific in great quantities, as well as to South America. Great superiority is claimed for the bolts made in this city, and they are said to be of such good quality that they never break under ordinary usage. Carriage bolts are the specialty of the establishment, and these are made in large quantities.

FURNITURE FACTORY AT RANDALL, LOS ANGELES CO.—A reporter of the Los Angeles Times recently made a tour through the above establishment, and found that important changes and improvements had recently been made in the factory. The reporter remarks that it is very evident that the factory officials and the operatives thoroughly understand their business, for every man is kept busily at work, and there is no time lost. Wood is taken from the dry kiln and taken to the sawyers; then it is run through the planers and surfaced, then taken to the band and jig saws to be cut out on the patterns, thence to the chapers and sand papering machines; if the wood is for tables the legs are turned on the lathe; the wood is then sent to the carver, thence to the men who set it up—put the pieces together—thence to the upholsterers and then to the finishers. And the beauty about it is that this work is going on continually, making a steady stream of wood from the lumber-yard to the shipping-room. The shaving collector is a great institution. In the basement is a double fan that creates a severe suction on one side and a blast on the other; large pipes are run from each machine collecting the shavings and sawdust and conveying it to a reservoir over the boiler; the dust is thrown out of the collector, and nothing but the clean wood is left; this drops into an au-

tomatic feeder into the fire-box, thus doing away with a fireman, for the refuse at the factory is enough to feed the boiler. The establishment has a first-class designer, and he is getting out some beautiful pieces of furniture. Every man in the building thoroughly understands his business, and there is some beautiful furniture being turned out.

EXTENSIVE BRICK-MAKING WORKS.—The *Livermore Herald* of a recent date says that Messrs. Remillard & Co., proprietors of the extensive brickyards near Pleasanton, are now making arrangements for the erection of a mammoth patent kiln in which the manufacture of brick may be carried on throughout the year, instead of only during the summer months, as at present. The building will consist of a series of twenty furnaces, inclosing a circular court, from the center of which will rise a high chimney. The diameter of the whole will be one hundred feet. The outer wall will be nine feet thick and about twenty high; the inner of nearly equal height but not so thick. Each chamber will have a frontage of twelve feet and a depth of twenty. The chimney will be 130 feet in height. Each chamber will have a flue communicating with this chimney. The brick will be burned in the chambers, and once started the work never stops—some burning, others being filled and others emptied all the time. Coal will be used for fuel instead of wood. Two extensive storage sheds, each of a capacity of 2,000,000 brick, will flank this mammoth kiln. The capacity of the kiln will be about 8,000,000 a year. This will be in addition to the present work of the yard, which will go on as usual. The present output is about 11,000,000. The new works will go into operation by the first of May next.

BET SUGAR A SUCCESS.—Claus Spreckels is meeting with the fullest success in his Watsonville sugar enterprise. He is satisfied and enthusiastic. From the first he has been confident of the success of the beet-sugar industry in California, when properly managed, and the beet modern mechanical appliances, and the product that is being turned out daily only serves to bear out his predictions. The first shipments of crude sugar came from Watsonville to the Portrero refinery about ten days ago, and trains have since been bringing carloads daily. The beets produced about Watsonville are proving very satisfactory. One farmer whose beets contained about 22 per cent saccharine matter will net \$8 a ton for his crop. When the seed was distributed the farmers were guaranteed \$4 a ton, but few anticipated they would realize double that figure. That the project is as much a success as could be is unquestioned. The understanding now is that when the busy times are through at the factory, Mr. Spreckels will think matters over and arrange for the location at one or two favorable points in the State of other plants for the carrying on of the industry in which he has such confidence. It has ever been the boast of this millionaire sugar refiner that he was trained to labor, and no one who has seen him at his factory during the first work of beet crushing can wonder that such earnest activity has brought him success. Dressed in old clothes, surrounded by the necessary dirt of the factory, he has set all his workmen an example of industry. The pulp which is left after the saccharine juice is expressed is used as cattle food. About seven carloads of pulp are being shipped daily from the beet factory to Henry Miller, Gilroy. Farmers who have fed pulp to their stock are well pleased with it. Cattle like it, and it is fattening feed. Beet sugar is the great coming industry of California.

A NEW INDUSTRY—TERRA COTTA LUMBER.—The International Terra Cotta Lumber Company has its headquarters for the Pacific Coast at Los Angeles. Its representative here, Mr. T. P. Lawrence, was recently in San Diego, looking into the advisability of establishing branch works there. Terra cotta lumber is a new building material, for which patents have been taken out covering the world. The name indicates the character of the material. It is made of fireclay and sawdust, in proportions of two-thirds of the former to one-third of the latter, and is burned in lengths of several feet, in form resembling sawed timber or dimension stuff, or in brick or block form, as may be desired. The wooden ingredient burns out, leaving a porous brick less than one-third the ordinary weight. The advantages claimed for this lumber are numerous. Among them, indestructibility, non-conduction of heat, cold and sound, dryness, lightness, ease of tooling, permeability to nails. Its porous surface also makes a prime anchorage for plaster and cement. Its fireproof quality makes it desirable as a means of reducing cost of insurance. It does not expand or contract with heat or cold. Can be heated white hot and cold water thrown upon it in that condition will not break it. It is said to be cheaper for house-building than lumber at \$16 per thousand. In the immense building in Chicago, where the National Republican Convention was held, \$180,000 worth of this material is being used for ceilings, etc. There are factories in Europe, Canada, Australia, and about thirty-six in the United States. There is also one at Los Angeles. There is an immense deposit of clay at Elsinore, directly upon the line of the Elsinore and San Diego Railroad now being constructed, which is used in this manufacture. There will soon, no doubt, be a factory for the manufacture of the new material started at San Diego.

COTTON AND WOOL.

Cotton Manufacturing at the South.

There appears to be a constantly increasing activity in the cotton-manufacturing interest of the South. Georgia and the Carolinas appear to take the lead. All through those States the capacity of existing mills is being increased and many new mills are being built or planned. There is also a gradual widening of the character of the manufactures being produced—more fine goods are constantly being made.

One of our exchangers makes an enumeration of a large number of mills that are being enlarged, and of new ones in progress of construction. The time when this enumeration was taken was during August and September—the two dullest months of the year. Among the new mills being built are the following:

In Georgia, the Richmond Co., near Augusta, is building a second mill with over 3000 spindles; a mill is being built at Newnan; the Paragon Co. at Columbia is building a mill to make fine ginghams; a mill is under contract to be built at La Grange; a 3000-spindle mill is just being started at Dallas, and a new mill in contemplation at Macon.

In South Carolina a \$100,000 mill is being built at Chester; one at Cowpens, and another at Seneca.

In North Carolina a \$100,000 mill is being built at Pineville, and another of the same capacity at Kotherfordton; mills will also be built in this State at Forest City, at Morgantown, at Fingerville (with 5000 spindles), at Iron Station, at Laurel Hill, and at Gibsonville.

A \$100,000 mill is going up at Lynchburg, Va., and one of same capacity at Enfield, Ala.

Three new knitting factories are also reported—one at Union Mills, Va., to employ 100 hands, and one each at Charlotte and Tarboro, N. C. These are all in addition to numerous enlargements of existing mills, and many others are supposed to be under construction or early establishment at other places. This information furnishes abundant evidence of the rapidly increasing industrial growth of the Southern States. There was never a time when such industries were more rapidly increasing at the North.

American Wool.

Qualities—In What Localities Produced and In What Amounts.

Everything relating to wool production in the United States has special interest just now. Questions concerning the amount produced, quality, classes and uses having been referred to Mr. J. R. Dodge, statistician of the Department of Agriculture, he answers:

The first of the three classes is clothing wool. This is the fleece of full-blood and grade merino, of fine, short fiber, remarkable for its felting quality. These wools are prepared for manufacture by carding rather than combing. The highest type of this race, the registered thoroughbred, is found in Vermont, where breeding flocks are more numerous than elsewhere, and in considerable numbers in Western New York, Ohio and Michigan, and scattered throughout the Western States.

The merino type of wool prevails almost exclusively in the three States named, in Texas, and throughout the Rocky mountains and Pacific Coast areas. Few sheep of other blood are found west of the Missouri river.

Western Pennsylvania and West Virginia furnish wool of the merino type mainly. The seaboard States of New England also furnish some grade wools of this type.

The second class, the combing wool of the tariff classification, includes the medium and long wools of the English breeds, the Cotswold, Leicester, Lincoln, several families of Downs, and other breeds of long and coarse wools, also popularly known as the mutton breeds. These are few in number compared with the merino type. Nearly all the sheep of the South, exclusive of Texas, are of this class, mostly descendants of less improved English sheep of a hundred years ago, with occasional infusions of better blood from England, Canada, or the Northern States. In Kentucky probably 99 per cent is the combing-wool class. A considerable portion, too, is highly improved, giving to this State the reputation of having a larger proportion of high-quality mutton sheep than any other State.

In the vicinity of the Atlantic cities, from Maine to Virginia, sheep husbandry is principally lamb production, the males being downs or other English breeds, and the ewes grades of both merino and the English types. This combination produces a mixed wool of a useful character. Then there are considerable numbers of the English breeds, though fewer than merino, scattered through the Western States, from Ohio to Kansas, and a still smaller proportion on the Pacific Coast and in the Territories.

As to the third class, the carpet wools, they are represented in the United States only by the Mexican sheep, which are the foundation of a large proportion of the range flocks, but so improved by repeated crosses as to furnish wool of the merino type, much of it of high grade.

It is also stated that the carpet-wool product of the United States is almost exclusively the fleece of sheep of Mexican origin, which are raised chiefly in Texas, New Mexico, Arizona, and certain other Territories of the mountain region of the country situated between the Mississippi valley and the Pacific Slope.

The imports of combing wool into the United States are chiefly English long wool, which enters into competition with the delaine or combing merino wool produced in this country.

As to relative quantity of clothing, combing, and carpet wools, respectively, produced in the United States, Mr. Jas. Lynch of New York, a recognized authority on wool statistics, writes under date of Sept. 26, 1887, as follows:

Iowa, Missouri, Minnesota, and States east of the Mississippi, except lower Southern.....	160,000,000
California.....	40,305,000
Oregon and other Western States and Territories.....	56,000,000
Colorado and New Mexico.....	21,000,000
Texas.....	26,000,000
Georgia, Lake and Southern.....	16,000,000

Total.....322,305,000

With the improved combing machinery now in use, nearly all of the first mentioned 160,000,000 pounds could be passed through the combs, and so also could a small portion of the 40,305,000 pounds of California, and perhaps five-eighths of the 56,000,000 pounds of Oregon and other States and Territories. A good deal of the 24,000,000 pounds of wool from Colorado and New Mexico can be combed, but very little use is made of it for that purpose. There is a small portion of the 26,000,000 pounds of Texas and the 16,000,000 pounds of Southern that could be combed, but hardly any of it is used.

All the wool can be used for clothing purposes, harring a trifling quantity of hairy and kempy, which comes chiefly from Colorado, New Mexico and Texas.

It may be said that the coarse wool from any section may be used for carpets. No one has embarked in the business of growing carpet wool by itself, nor is there any likelihood of its ever being done.

A considerable portion of the wool product of this country which, according to the tariff now in force, is classed as clothing wool, has, by comparatively recent improvements in machinery, been rendered susceptible to the combing process, and thus has been utilized in the manufacture of worsted goods, embracing certain higher grades of wearing apparel, women's and children's dress goods, as well as fabrics for men's clothing. Such wools, though in the trade regarded as combing wools, under the terms of the revenue-law tariff, would be classed as clothing wools.

COVERING FOR COTTON BALES.—The manufacturers of jute bagging for cotton will, from present appearances, go into some other business in the near future. They doubled the price of jute bagging, thinking, not wisely, that there was nothing else that would serve the purpose. But it has been demonstrated that jute is only one of a dozen materials of which bagging for the purpose named can be made. If the outcome is that the jute men are left in the cold, the verdict will be, served them right. It is an unwise proceeding to kill the goose that lays the golden egg. Pine straw bagging made from the needles or leaves of the pine tree finds favor among merchants and shippers at Charleston, and it is predicted that before another season 100 factories will be engaged in its manufacture in North and South Carolina. Wire gauze has also been recommended as a covering equal to jute bagging, having withstood the severest tests when exposed to fire, and the subject is being favorably considered at the New York Cotton Exchange.

THE INCREASING DEMAND FOR COTTON AND IRON.—Not very many years ago people wondered what on earth the world was going to do with the constantly increasing yield of our Southern cotton crop, which then had reached an annual output of 2,000,000 bales. But the world found use for it all, and now finds use for our 7,000,000 bales. The people of the South went to manufacturing the staple after awhile, and thought they would soon close every Northern mill. They have not done it thus far, nor are they likely to do it. The manufacturing interests of the North will continue to increase, and so will those of the South, and the world will find use for the constantly increasing product. Just so the world will find use for all of our iron, as it did for our continually increased cotton crop. In the meantime the blast furnaces of the North will continue for a long time to furnish her share of the product, and the same business will continue to increase at the South.

COTTON MILLS IN JAPAN.—The number of cotton-mills in Japan two years ago was only about 8 or 10; now there are 21. Considerable interest has sprung up in that country in this industry since its introduction.

BOOT AND SHOEMAKER.

Improvement in Leather Manipulation.

A new system of connecting several thicknesses of leather, either in making double or triple thicknesses of leather belting or in affixing the soles of boots to the upper, is being introduced into England, where machines are being exhibited as used for attaching the soles of boots. The new system partakes more of the character of riveting than any other known method, the new rivets being made of metal-covered wax thread. Each fastener is thus a tubular rivet filled with firmly inclosed wax thread. One of the chief objects of this tubular rivet or piece of metal-covered thread is a firm fastening, with greater flexibility than has

hitherto been obtained with machine work. It would be impossible to explain the construction of the machines used without drawings, but we may say that the covering process is performed on a machine in which a strip of brass is pulled through dies which inclose the wax thread fed to them. The tube-covered thread from this machine passes to another in which the tube is roughened or corrugated circumferentially by small rotating disks with fine teeth. The corrugation helps to give the fastener a firm hold, and also to make it more easily flexible than it would be if the metal tube were plain. The edges of the strip are not soldered or brazed so as to make it into an actual tube. Boot soles are affixed in a few seconds by another machine which pierces the leather out off a length of the metal-covered thread, automatically adjusting it according to the thickness of the leather being fastened. The covered wax thread is then driven vertically into the sole of the boot. It thus presents an end-wearing surface; the brass covering, as the leather wears, burrs over, forming a head on the outside of the sole, and prevents its working into the foot, an objection which attaches to other metallic fastenings.

Changes in Shoe Manufacture and Styles.

Skilled labor in shoe manufacture has been greatly reduced by the introduction of machinery into the business, and the production of cheap shoes has been increased in proportion. This inexpensive mode of turning out footwear has at length been subjected to such keen competition, and the product consequently as reduced in real value, that it is said by a Philadelphian experienced in the art that the best opening for a shoe manufacturer to-day is on hand work. People are willing to pay for what may be called exclusive style. A welt shoe, bottomed and finished by hand, will probably cost 15 cents per pair more; but if skilled mechanics are employed, the shoes will easily sell at 50 cents extra and not meet with the same competition either.

The machines constructed to make shoes are a marvel of ingenuity, and many pages would be required to fully describe them. Suffice it to say that shoes are lasted, sewed, nailed, trimmed, heeled, burnished and finished by machines constructed for that purpose.

A writer, in alluding to the changes in style, says: A change is impending in styles of shoes which, if accomplished, will deprive the street gamin to a great extent of a favorite occupation. Russet shoes are becoming fashionable. The demand has been much greater than the supply this year, and manufacturers are preparing to introduce them and push their sales for next spring and summer. Samples will be out and on the road in November. Patent leather shoes are being more used for business wear. They are commended on the score of economy. They don't require to be "shined up" every day, a matter which calls for both money and time.

Pretty woolen shoes for women, misses and children are being introduced for house wear, and a stouter make is put up for men. They are made with thin leather soles, which are covered with lamb's wool, and are warm and comfortable. For those for the women the colors and designs are lovely, and at from 65 cents to \$1 per pair they sell well.

A stylish shoe is a woman's Oxford, made with patent kid vamps, oozie quarter and calf tip, made on an opera last, with trimmings to match the colors of the quarter. The combination of colors in this shoe is, in many instances, extremely tasteful.

"The manufacture of boots for cowboys," says R. G. Haskell of Boston, "used to be quite extensively carried on. A few years ago we couldn't put too much money into them. They wanted them of the very best quality—stays, and perhaps the sun and moon, inlaid in bright-colored leather about the top, sometimes with fancy lacing up the front, and sometimes with fancy patterns on the sole by driving nails. It was not uncommon to get several dollars for a pair. The demand is changing; plainer and more unpretentious goods answer the purpose; many of these fellows wear common boots now. One distinctive characteristic of cowboy boots has been the high heels. From two to three inches was the common height. These heels are of much service when riding in keeping the feet in the stirrups, but when it comes to walking the cowboy has to take his shoes off, for pedestrianism is almost impossible with such high heels."

Among changes that are taking place in the shoe trade is that of manufacturers who have been making shoes for jobbers only, now seeking the favor of the retail trade. This process is reported to be constantly going on among the manufacturers of Lynn, for instance. It would seem, reasoning on this line, that the jobbing business is likely to find itself out in the cold after awhile. That such will not be the case, however, is made evident, if in no other way, by noticing just how such processes have gone on in other lines of trade, and the jobber is quite as important a factor as ever.

THE FIRST TO MANUFACTURE SHOES, it is said, were Saints Crispin and Crispianus, two pious Italian monks and philanthropists who lived in the third century, and since their day all followers of the shoe-making craft have been called Knights of St. Crispin. Before their day, history tells us, only sandals were worn.

THE WATCHMAKER.

American vs. Imported Clocks.

There are a good many imported clocks in this country; those imported in late years are here for no other reason in the world than because it is the fashion to buy things made abroad. The imported clock is not as good a timekeeper as the American clock. On the contrary, it is well known that this foreign-made clock will not compare with the American clock so far as telling the hour of the day is concerned. But there are a good many people in the world who do not buy clocks to keep time, it is, in a very cheap way, fashionable to possess a French or a German clock, and that is all there is of it. Fashion covers a multitude of deficiencies. These imported clocks are mounted in fancy cases, and there is quite a large class of Americans to whom the name of Paris or Berlin has a sort of undefined fascination.

It is safe to say that the American who buys an imported clock does it from some other motive than an utilitarian one.

This fancy cases in which French and German clocks have been enveloped has undoubtedly had something to do in the past with their importation. But to-day American clocks put in cases *bizarre* enough to suit the taste of the most fastidious can be found. The style of the case or the quality of the works does not cover the reason why foreign-made clocks are bought in this country. As to cost, the American clock is much the cheaper. The simple reason to-day why French clocks are popular is because they are French.

American clocks are exported in large quantities, and sold just where French and German clocks are made. The exported clocks are sold because they keep time and are cheap as to cost.

A great many things of foreign make are used in this country for the same reason that French and German clocks are used. "It is English, you know," or "It is French, or German, don't you see?" has a good deal to do with it.

NON-MAGNETIC WATCHES—Watches are now made, so protected from magnetic influence as to be absolutely free from it, even when held in the immediate vicinity of the most powerful dynamo. Ever since the great railroads of the country have compelled their employees to provide themselves with timepieces that would not be affected by the magnetism generated by the car-trucks, there has been much speculation as to whether such a watch could be made, and a sharp rivalry has been going on between the American and Swiss manufacturers. The test was highly satisfactory, and once more proved that whenever a new invention was imperatively demanded American genius could fully hold its own against the whole world. Major King's magnet was so powerful that an ordinary watch was stopped stock still as soon as it came within three feet of it. Before the test was made there was quite a diversity of opinion among the experts present as to how far it would prove successful. Those who believed that a watch might be constructed that would resist magnetic influence under ordinary circumstances, were also of the opinion that when it was subjected to this most powerful magnet in the world, the steel pinions would jar so on the working parts that the watch must necessarily stop. For ten minutes the watch was held in front of the magnet, without any effect being desirable in its movements.

A TRANSPARENT WATCH has recently been manufactured by the Waltham Watch Co. The case and plates are of Brazilian pebble, or rock crystal. Holes are drilled in this crystal plates for the various screws and fittings; the pivots are set in rubies and sapphires, and the plates are held apart by sapphire pillars. The dial is a skeleton of gold. Diamonds mark the hours and rubies the minutes. The watch is, of course, transparent.

THE HAND MADE TIME-PIECES of the Swiss and French, who have so long held the supremacy as clockmakers, are not now regarded as superior to those of American machine make. The American machine-made watch is as finished and accurate as its foreign competitor, and is, of course, vastly cheaper.

SHOP NOTES.

TRAINED MECHANICS.—It is a notable fact, and one, too, not generally known, says the *Industrial World*, that some of the "best all-around" mechanics, i. e., those who can turn their hands to all kinds of general machine work, are men who learned their business in small shops, where all sorts and all classes of work are done. An ingenious thinking man placed in such a shop has the best possible chance to develop all the talent there is in him. The hundred and one odd jobs required to be done will cause him to devise ways and means, and "to think," and in these ways he will grow to be a man fertile in resources, dexterous in touch, and ready for nearly any kind of work which may come along. Now mark the difference. A man trained in a large shop, with its score or more of departments, learns or works through, as a rule, one, two or three differ-

ent departments, of course becoming an expert in the several branches; but should occasion arise for him to do some particular work of which he has but a slight knowledge, he is out of his latitude and makes poor progress, simply because he has not done all kinds of work, while the man trained in the small shop can adapt his hand to almost anything which turns up.

FINISH WHAT YOU BEGIN—Thousands start well, but never finish one thing at a time. They have a dozen things on hand and no one completed. Time is wasted on unfinished work. Always finish what you begin. One thing finished is worth a hundred half done. The completion of an undertaking yields more pleasure and more profit than dozens of plans. The man who is always planning or scheming is rarely, if ever, successful. He often furnishes ideas for others who go persistently to work and finish what his ideas suggested. "That was my idea—my plans," we frequently hear some one say, but the man who carried it out was the one who benefited himself and others. Do not begin what you cannot finish. What you undertake to do, do, and reap the reward of your own ideas and skill. This is good advice both in and out of the shop.

WASTE OF LUBRICATING OIL—A great deal of oil is wasted through not employing a suitable filtering device. The needs of high speed machinery—and higher speeds is always the order of the day—call for the passing of more oil by and over the journals, and while the intention is to make some kind of a second use of this oil where there is any purpose for which it may be used, practically it goes mostly to waste. Oil filters are cheap and simple, and their use ought to be more common. In hundreds of cases their use would effect a very material saving, and frequently they would be the means of bringing about the use of a better quality of oil, which now seems to be too valuable to be wasted.—*American Machinist*.

A NEW BELT FASTENING of English origin is described as follows: Each end of the strap is divided into series of fingers about one-quarter or three-eighths of an inch in width, one end having an odd and the other an even number. Each division is pierced with a small hole and twisted 90°, and the two series having been placed together, a pin is put through the whole and secured by riveting its end over a washer. From the average of four experimental tests made in a large steel works establishment in Sheffield, the fastening gave a breaking strain of 644 pounds in a belt 1½ inches wide. It is said to give much satisfaction, particularly for driving fans and other machinery with small quick-running pulleys.

INGENIOUS WAY OF COOLING A JOURNAL.—Wood and Iron says that quite an ingenious way of cooling a journal that cannot be stoppied is to hang a short endless belt on the shaft next to the box and let the lower part of it run in cold water. The turning of the shaft carries the belt slowly around, bringing fresh cold water continually in contact with the heated shaft, and without spilling or spattering a drop of the water.

Meetings and Elections.

The following mining companies have elected officers for the ensuing year:

MEXICAN M. Co., Dec. 4. Directors, Chas. H. Fish (president) A. B. Hull (vice-president), A. W. Havens, Con O'Connor and Geo. Frier. Chas. E. Elliot was reappointed secretary, D. B. Lyman superintendent, and the Nevada Bank treasurer. The secretary's financial sheet shows receipts for the year of \$76,975.90, and a cash balance on hand December 1, 1888, of \$13,167.93. The superintendent's report is a brief statement of the work performed during the year.

BALTIMORE S. M. Co., Dec. 4. Directors, John H. Dickinson (president), E. M. Hall (vice-president), L. S. Rose, Chas. Hirschfeld and A. R. Grim, Trustees, Alfred R. Grim was re-elected secretary and E. Strother superintendent. The secretary's report shows an expense account of \$70,827.83 for operating the mine during the year, and a cash balance on hand of \$7310.25.

PERSONAL.—Mr. David T. Day of the U. S. Geological Survey is on a visit to this coast. Mr. Day is the Chief of the Division of Mining Statistics and Technology, and his annual report is entitled the "Mineral Resources of the United States." This volume is the most important to the mining community that the Survey publishes. It treats of all the mineral substances of the United States except gold and silver, which are in the care of the Mint Director. Mr. Day is collecting material for his forthcoming report, and familiarizing himself with the mineral regions of this coast. He will make but a short stay in California, business requiring his attention in Washington early in January.

THE TRUCKEE REPUBLICAN says: The rain has spoiled all the ice that has formed on the ponds. Should the season be propitious there will be 100,000 tons of ice cut along the Truckee this winter.

THE MOHAWK CANAL in Yuma county, Arizona, irrigating 50,000 acres of citrus and vine lands, was sold recently for \$200,000.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for the Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING NOV. 27, 1888.

- 393,693.—TAPE MEASURE—C. L. Bard, San Buenaventura, Cal.
393,686.—ORGAN—A. Birkeland, Sacramento, Cal.
393,559.—HYDRAULIC MINING APPARATUS—Hendy & Loveridge, S. F.
393,706.—STATION INDICATOR—J. I. Irving, S. F.
393,439.—DREDGER DIPPER—M. C. Laaton, Staten Island, Cal.
393,512.—SCAFFOLD BRACKET—J. A. Long, Spokane Falls, W. T.
393,440.—ROCK CRUSHER—J. B. Low, S. F.
393,479.—SELF-CLEANING WEED CUTTER—F. E. Lux, Walla Walla, W. T.
393,443.—MAKING IRON CASTINGS—G. G. Mullins, Los Angeles, Cal.
393,487.—EDGE SHAVE—A. Schillmoller, Oakland, Cal.
393,433.—SUBDIVIDING MATCH BLOCKS—Sverio & Case, S. F.
393,454.—LEAD BATH APPARATUS—A. M. Shields, North Temescal, Cal.
393,593.—BONNET HOLDER—Nancy E. Veatch, Gales Creek, Ogn.
393,456.—MECHANICAL MUSICAL INSTRUMENT—Geo. F. Wells, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business, for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

STATION INDICATOR.—JASON I. IRVING, S. F. No. 393,239. Dated Nov. 20, 1888. The invention relates to one of that class of station indicators for use in the cars of street or other railroads for the purpose of giving information as to names of streets or stations which the car is approaching, and also for advertising suitable display matter in connection therewith. It consists in a rotary shaft by which the motion is imparted or transmitted to a suitable indicating mechanism, this shaft being actuated by a spring or stop for limiting the motion of the shaft, a novel trip for relieving the shaft and rendering its motion periodical; an electric circuit normally open, and an electric magnet in said circuit for operating the trip, a circuit closer and a novel mechanism for automatically condensing the spring which actuates the main shaft.

SPRING CLASP.—HENRY ELEAU, S. F. No. 393,222. Dated Nov. 20, 1888. This is one of that class of catches or clasps in which a spring tongue enters an opposing month-piece and engages shoulders therein, said tongue being provided with a button or knob, pressure on which relieves it from its engagement. These clasps, though applicable to many devices, are to be found principally in articles of jewelry, and usually in bracelets. The invention consists, in connection with the spring tongue, of a knob or button having a threaded stem or shank seated in a fixed nut on the free end of the tongue, and constituting a set screw for locking the clasp at the same time that it serves, when not set up, as an ordinary pressure knob to relieve the tongue. The object is to provide a clasp of this character which may be securely locked, thereby avoiding accidental disengagement by unintentional pressure on the knob.

MACHINE FOR SUBDIVIDING MATCH BLOCKS.—FRANK SVERIO and JOSEPH D. CASE, S. F. No. 393,453. Dated Nov. 27, 1888. This improvement in match-making machinery consists in a table or frame having a curved top through which operate a gang of circular saws, and over which the match block passes. The table or frame has side rails and an adjustable clamp, for the match block is guided by the rails and has a handle plate for drawing it and the confined block over the top of the table and against the saws. The ordinary sulphur match is made from blocks of wood, which, after being subjected to the splitting operation in one form or another, are put through the proper treatment, whereby their split surfaces are spread to separate each splint down to the fibers or web which still holds them together at the base, so that the blocks assume a curved shape, their outer and inner surfaces being concentric, and their ends and sides in radial planes. They are then dipped in proper chemicals and left to set. These blocks contain thousands of matches, and are too large to be put on the market in that shape, so it is usual to handle each block, counting the number of matches generally, in square sets, and then by hand with a separating knife dividing these sets and forming thus small blocks, in which shape they are packed for sale. This invention has for its object the subdividing of these large blocks into the smaller ones, doing this by machinery accurately and avoiding all handling, which is very objectionable and injurious.

PARK PLACE.

(LAUNDRY FARM.)

Between Fruitvale and Mills Seminary Near Oakland.

To parties desirous of establishing Homes, a rare opportunity is offered to secure land at a price lower in comparison than anywhere else in California.

It is located only a short distance from Oakland, between Fruitvale and Seminary Park, and immediately adjoins the grounds of Mills Seminary.

The land is just rolling enough to render it beautiful for building sites. Situated at the base of the foothills, it has a most desirable climate, and its proximity to the best Female Seminary in the State makes it suitable as residence property for families having girls to educate whom they wish to have live at home.

The land can now be purchased at a low price, in Lots or Blocks, with the certainty of a quick rise in value.

For investment, it is an opportunity which rarely occurs, as Oakland is rapidly extending in this direction, and must, in the near future, include this land within its limits. This is proved by the fact that in 1860 Oakland had but 1000 people; in 1870, 10,000; in 1880, 30,000; now, 65,000 and growing more rapidly than ever.

People in the interior who desire to educate their children at the State University, in Berkeley, or at schools in Oakland or San Francisco, can establish here a rural home and be constantly with them.

This land was part of the Laundry Farm, that old and well-known Summer Resort, and is just far enough from the Picnic and Camping Grounds to be desirable and add value.

PARK PLACE is connected with Oakland and San Francisco by the Alameda County Railway, having eight trains each way daily. For particulars, inquire of the owner.

JOSEPH H. DORETY,

529 Commercial St., San Francisco, Cal.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents,
220 Market St., Elevator, 12 Front St., S. F.
TELEPHONE NO. 658.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

The EXPLORERS' and ASSAYERS' COMPANION.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.
Price, \$6.00 post-paid. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulae as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

STORAGE

DEWEY & CO., 220 Market street, San Francisco, Cal.

THE DUCKER PORTABLE HOUSES

Combine all the comforts and advantages of a permanent building with the qualities of simplicity, stability, lightness, ease of transportation, quickness of putting up and taking down, ventilation, heating, and electricity for lighting. Equal

ly serviceable for Contractors' Uses, for Sheep and Cattle Ranches, Mining Camps and for Surveyors and Prospectors, Hospitals, Seaside and Summer Resorts, and in all localities where material and skilled labor are scarce, and where it is sometimes desirable to change location. These Buildings can be especially constructed for Hunting and Fishing Camps, Billiard Rooms, Photographers' Studios and Law Pavilions. They are built in sections and are put up without the use of screws, nails or any external appliances whatever. Two men can put up the building on ordinary ground in 2 hours' time with out skilled labor. Price, \$250 to \$750. Thoroughly reliable and inducive business men only, may communicate with this Company relative to using its representative.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description

ALL WORK TESTED AND GUARANTEED.

IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

MARSHUTZ & CANTRELL.

Send for Circulars and Price List.

B. E. HENRIKSEN'S
PATENT

Automatic Safety Clutch

For ELEVATORS.

Constructed upon Scientific Principles.
Operates and Sets Automatically and Ever Ready for Service.

Entirely free from all springs, pawls, triggers, governors and other unreliable parts likely to stiffen, corrode or gum up.

ALWAYS IN FULL SIGHT, BUT NEVER REQUIRING ANY ATTENTION.

Has been practically tested in six actual elevator accidents and saved 51 persons from injuries and death.

SILVER MEDALS awarded by the Mechanics' Institute in 1880, 1882 and 1883. SPECIAL CENTENNIAL GOLD MEDAL awarded by the American Institute of New York, Dec. 3, 1887. Apply to
B. E. HENRIKSEN, Architect.
218 Post St., San Francisco.

ENLARGED!

RAND, McNALLY & CO.'S

BUSINESS

ATLAS,

1889.

WILL BE DOUBLE THE SIZE OF
ANY OTHER ATLAS
PUBLISHED.

New Size of Page, 15x21 Inches.

It will contain new large scale maps occupying two pages only (no cut-up maps) of all the important States. The entire arrangement will be new, embodying the most improved methods of reference and indexing, clearly showing the location, population and commercial advantages of over 200,000 towns in the United States, Canada and Mexico.

COAL MINES OF THE WESTERN COAST.

A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for \$2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager.

461 Howard St., San Francisco.

HOOKE & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

—THE—

PERFECTED DOUBLE Economic Stamp Mill.

BEST and
CHEAPEST
In the World.

AFTER SEVERAL YEARS OF EXPERIENCE we have finally perfected this Mill. Our principal improvement consists in oscillating the stamps by means of sleeves with universal joints, allowing the stamps the utmost freedom of movement, without tendency to bind or clamp in the working parts.

Special machinery of all kinds. We have a large list of Standard Patterns, Gears, Pulleys, Boxes, etc. REPAIR WORK SOLICITED.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

PORTABLE and DURABLE.

WEIGHT, 4 TONS.

It is a Full Fledged Quartz Mill without Gears, Cogs or Pulleys.

Power applied direct. Works Ore at Low Cost. More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working. The first one crushed used in Durango, Mexico, was built at my shop in Sacramento, and under my patent. Any infringement on this Patent will be prosecuted to the full extent of the law.

WM. GUTENBERGER, Sacramento Foundry, corner N and Front Sts., Sacramento.

THE "ECLIPSE"
Copying Apparatus.

One thousand copies in black. No special pen, no special paper, no stencil required. The "Eclipse" reproduces the natural handwriting to exceedingly faithful that in most cases "Eclipse" circulars have been taken for ordinary written letters. Specimens and circulars on application.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Dec. 6, 1888.

Although this is the closing month of the year, general trade is good. Iron workers expect 1889 to be a prosperous year, provided raw material (iron, coal and lumber) do not cost too much. Many new buildings and other improvements will be let out under contract, if the iron and wood parts are not excessively high. Merchants report continued free collections. Exchanges on New York are not so strong, which goes to show that remittances to the East are falling off in volume. Bankers look for an active money market in this month, based on the heavy sums to be paid out for taxes, interest, dividends, etc. The drafts on the banks to meet these requirements will largely reduce the surplus funds now on hand, but while doing this no friction is looked for, owing to the lateness of the season, conservative and all heretofore well-informed mining stock operators do not look for much if any of an upward movement in stocks before the turn of next year, if it comes even then. If this shall prove true, then the money requirements from stock brokers will be light, for many outside operators will sell their stocks for fear of a lower range of values before an important upward move. In grain options and for other speculative purposes the call for funds is light.

SILVER—The market the past week was firm at the decline quoted in our last issue. Some sales were made at 93½¢, but afterward 93¼¢ was obtained. The supply is still said to be light, causing buyers to pay full prices. While the news from the mining districts is of the most important character, yet the many delays in the work going on in them, due chiefly if not entirely to stock manipulation, cause many to form the opinion that the silver bullion output will not be materially increased before the turn of the year, unless the association lately organized in this city to have the many abuses which have crept into the management of the mines listed on the two exchanges compels the managers to pursue a more honest and equitable course toward the outside stockholders. From the Comstock mines there is confirmation of the new development on the 1650-foot level in Con. Virginia. It is said to be more important than before claimed. They have gone into it over 50 feet to a northwest course. The ore is said to be quite rich, but for stock purposes its importance is not admitted, which is substantially shown by the company passing the November dividend. In Alpha, Belcher, Crown Point, Con. Imperial, Challenge, Yellow Jacket and Confidence, work of an important character is going on, but then the work is being done with the view of "killing time." From the middle mines, Hale & Norcross, Chollar, etc., advances of the above tenor are also at hand. In the Tuscarora district the mines promise to increase their output of silver in this month. In the Quijotoa district important prospecting work is going on, with the outlook favorable for an increased development. The mill is not run to full capacity, so that the silver-bullion output will not average much over \$15,000 a month—enough to meet all expenses in the mine that is being chiefly explored. In the Calico district in this State the mines are being well prospected, with the outlook favorable for a large output of silver bullion.

London cables came through to-day reporting silver 42.9-16d. This decline was indicated yesterday by the low prices. Indian Consol bills were allotted. New York came through at 92½¢. In our market buyers bid 92½¢ to-day. There was quite a panicky feeling in stocks to-day. At the declining prices insiders are reported to be buying.

QUICKSILVER—An improved home demand for the mining districts is reported, as the recent rains have allowed the starting up of quite a large number of mills. For export there is a fair movement. The latest quoted sale is \$42.50.

LEAD—The market is featureless. Values appear to be slowly giving way. No important movement is looked for until after the turn of the year.

COPPER—The market has a firmer, more confident tone, due to gradual absorption by the syndicate of the output of the more promising mines and also to the fire in the Calumet and Hecla mines. The trade call is slow.

TIN—The market for both pig and tin plate has a weaker tone in sympathy with the slight decline abroad. Buyers of round parcels to arrive are trying to obtain further concessions. The consumption in 1889 will be larger than ever before.

IRON—The market is dull and inactive for both spot and to arrive. Iron workers do not appear disposed to anticipate their wants to any great extent unless offered inducements, but importers say that the supply markets are very strong, which combined with higher freights precludes a lower range.

CHROME IRON ORE—Kruse & Euler, who handle supplies on this coast, report steady shipments to the East.

COAL—For spot an advance of \$1 per ton has been established on Australian. For domestic, prices are unchanged. Under the stimulus of high prices the output of coal costs is not only largely increased, but constantly enlarging in volume. Arrivals of coal at this port in November were 140,600 tons, against 121,600 in November, 1887. For the first 11 months of 1888 they were 1,272,800 tons, against 966,800 for the same time in 1887 and 875,950 in 1886. This year's arrivals are the largest ever known.

COKE—The market is bare of English, even \$20 per ton failing to draw out supplies. Two vessels are leaving England for this port having coke on; it is held at \$15 to arrive.

Eastern Metal Markets.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":
Prices generally ruling for metals not regularly

dealt in on Call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, @—; Biliton Tin, \$24.50@—; Banca Tin, \$24.25@24.50; Baltimore Copper, \$—@—; Orford Copper, \$16.00@16.25; P. S. C. Copper, @—; Foreign Lead, \$4.75@5.00; Foreign Spelter, \$6.00@6.25; Antimony, \$10.00@13.50.

TIN—Trading has reached a total of 110 tons, or within 20 tons of last week's figures; but the aspect of the market has been less spirited.

COPPER—With another perfectly blank record of sales, has yet been more irregular, tending on the whole to increased firmness. The relative position of the several options has been twice reversed, the earlier deliveries having been most preferred; but at the close these weakened.

LEAD—Less interest has been taken in the metal, and recorded sales have fallen off to 116 tons.

SPELTER—Became heavy early in the week, losing an eighth of a cent; but has partially recovered toward the end, at the same time receiving more attention.

PIG IRON—Prices are remarkably steady considering the apathy of buyers. Large buyers are not in the market to any extent as yet, and are evidently waiting for sellers to make their first move. Meantime only small lots are taken at quoted rates.

MANUFACTURED IRON—The mills are all fairly well supplied with orders for the balance of the year, but offerings at low prices by Western concerns unsettle the market. There is a disposition to make moderate concessions to desirable parties, but no quotable changes can be made as yet, as a large proportion of the demand is for small lots.

By Telegraph.

NEW YORK, Dec. 6, 1888.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42½	93½	17 45	3 70	22 15
Friday	42½	93½	17 45	3 70	22 30
Saturday	42½	93½	17 35	3 75	22 20
Monday	42½	93½	17 40	3 70	22 00
Tuesday	42½	93½	17 40	3 70	22 00
Wednesday	42½	93½	17 40	3 72½	21 85

The market closed as follows: Borax is steady at last week's figures. Quicksilver is something firmer. There were light sales at 59¢/c. Last week's copper prices are not immediately affected by the Calumet and Hecla fire. No speculative impulse was aroused and few spot orders appeared. Calumet and Hecla stock declined about 50 points on the news and closed at \$2.70. Offerings of pig lead are light. General business was dull. Refined petroleum—Barrels—\$7.20; plain cases, \$9.20.

Mining Share Market.

The Comstock lode is looking very well at present, and many persons think a lucky strike anywhere along the line would send stocks up at a hoisting rate. More interest is being paid to work on the lode than for some time past.

At the Consolidated California and Virginia office it is estimated that the gross yield of the mine for the fiscal month now drawing to a close will be between \$220,000 and \$225,000, which, together with the surplus previously on hand, will give a sum that will fall short between \$7000 and \$10,000 of the amount required to pay the monthly expenses and a dividend. The company will carry over about \$100,000 in coin into the next month.

The following companies have cash on hand according to the monthly financial statements placed on file:

Alpha, \$1848 64; Alta, \$43,108 23; Andes, \$19,887 54; B. lcher, \$14,933 41; Best and Belcher, \$16 606 49; Bodie, \$34,396 48; Bullion, \$14,234 49; Bulwer, \$7694 99; Benton, \$3318 42; Caledonia, \$13 746 49, and the balance of an assessment to collect amounting to \$1535 10; Chollar, \$2918 89; Con. Cal. and Virginia, \$56,507 09, and \$165 508 72 in unpaid bullion. Confidence, \$75,653 80; Con. Imperial, \$21,618 47; Crocker, \$4843 66; Crown Point, \$8423 88; D. I. Monte, \$142 66; Exchange, \$16,436 25; Found Treasure, \$769 79; Gould and Curry, \$11,837 08; Hale and Norcross, \$893 30; Independence, \$3080 16; Julia, \$1059 28; Lidy Washington, \$24 828 18; Locomotive, \$3297 62; Mexican, \$13,167 93; Monna, \$21 642 14; Navajo, \$2,003 47; Pondera, \$99 27; Ophir, \$30,488 46; Overman, \$13,028 69; Scorpion, \$2247; Standard, \$4191 45; Syndicate, \$9273 43; Utah, \$17,526 54; Union, \$2445 88; Welden, \$2623 40.

The following companies have an indebtedness: Belle Isle, \$156 23; Challenge, \$4832 24; Commonwealth, \$49 154 18; Grand Prize, \$31,540 29; Holmes, \$1382 80; Nevada Queen, \$35,928 80; North Belle Isle, \$16,083 02; North Commonwealth, \$1749 88; Peer, \$5550 45; Peerless, \$4769 48, but has an offset of bullion valued at \$7791 63; Potosi, \$1273 40; Occidental, \$2972 88; Savage, \$35,373 74; Seg. B. lcher, \$26,681 19; Sierra Nevada, \$5535 20.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Peerless, Nov. 29, \$7791; Mt. Diablo, 29, \$7154; Germania, 28, \$4790; Hanauer, 28, \$2800; Queen of the Hills, 28, \$1100; Hanauer, 29, \$7500; Queen of the Hills, 29, \$8500; Hanauer, 30, \$2075; Germania, 30, \$3019; Con. Cal. and Virginia, Dec. 1, \$24,964; Confidence, Dec. 4, \$16,672; total for November, \$82,729; Savage, Dec. 6, \$8377; Mt. Diablo, \$6, 8536.

Our Agents,

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Assessment Notices.

William Penn Mill and Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Devil's Gate Mining District, Lyon county, Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 5th day of November, 1888, an Assessment (No. 3) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 59, Nevada Block, No. 300 Montgomery street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 15th day of December, 1888, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 31st day of December, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. J. SCOVILLE, Secretary.

OFFICE—Room 59, No. 300 Montgomery street, San Francisco, California.

Lord of Lorn Gold and Silver Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Gold Hill Mining District, Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 13th day of November, 1888, an Assessment (No. 4) of Ten (10) Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 313 California street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 28th day of December, 1888, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the 22nd day of January, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

L. G. HARVEY, Secretary.

OFFICE—313 California St., San Francisco, Cal.

Gover Mining Company—Location of

principal place of business, San Francisco, California. Location of works, near Drytown, Amador County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors held on the 23rd day of November, 1888, an Assessment (No. 1) of Fifteen (15) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Nos. 13 and 15 Fremont street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 5th day of January, 1889, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the 22nd day of January, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

L. G. HARVEY, Secretary.

OFFICE—13 and 15 Fremont Street, San Francisco, Cal.

FOR SALE.

The Empire Foundry and Machine Shop in the city of Marysville, now and for many years doing a remunerative business, is offered for sale at less than half its value. Everything as it stands—stock, machines, patterns, real estate, etc., etc., will be sold on easy terms. A first rate opportunity for establishing an agricultural implement manufactory as an adjunct. This is the only foundry and machine shop in the neighborhood.

For further particulars address

R. HOSKIN, Marysville.

PACIFIC ROLLING MILL CO., Cast Steel Castings and Steel Forgings

.....MANUFACTURERS OF.....

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1/2 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angles, Channels, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

BRYAN'S ROLLER QUARTZ MILL,

The most perfect Roller Mill made, for the following reasons:

1. It is cheaper.

2. It is more durable.

3. It crushes a larger amount of ore with less power.

4. It amalgamates a larger percentage of the gold.

5. Its "clean-up" is quicker and fuller.

6. It is portable, requires no frame-work, and is ready for the foundation as it leaves the shop.

OFFICE OF THE CADELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

Bryan's Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60-mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screen 12 tons in twenty-four hours; through 50-mesh, 15 tons; and through 40-mesh, 18 tons. This proportion has been continuous. One set of Dies will crush from 1500 to 1600 tons. One set of Tyres will crush 1500 tons. One ring plate will crush from 2200 to 2300. The mills require very little attention. At our mill an ordinary "poon" earning one dollar per day has complete charge. In regard to slimes, in comparison with stamps by reason of the discharge surface and the continuous agitation by the scraper, a much less amount of slimes is created. A three years' experience teaches me that, in every respect, the mills are a complete success and of material benefit to the mining world. They can be set up and running in 48 hours, and can be dismantled in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator, it is unequalled by any mill now in existence.

Yours truly,
D. M. WURNS, Superintendent

THE GATES,

THE GREATEST ROCK CRUSHER ON EARTH!

WHAT IS SAID OF IT BY ONE WHO HAS USED IT THREE YEARS.

OFFICE OF ERNEST L. RANSOME, MANUFACTURER OF ARTIFICIAL STONE AND CONCRETE,
No. 508 CALIFORNIA STREET, SAN FRANCISCO, November 9, 1888.

Pacific Iron Works—GENTLEMEN: In answer to your request for my experience with the Gates Crusher would say, that I have used one for the past three years crushing trap rock, basalt and granite for making concrete, the most of it being very hard and calculated to test severely the strength and durability of any machine.

I have crushed in that time probably not less than 10,000 tons of this material, without any repair being necessary, and without any change of shoes and dies, and, as far as I can judge, they appear to be good for as much more service.

I have had more or less experience with nearly every crusher in the market, and regard the Gates as infinitely superior to them all. In fact its efficiency, durability and capacity for work is simply wonderful. For crushing all kinds of ore, ballast or macadam—fine or coarse—nothing can compare with it. You are at liberty to refer any parties to me who may want further evidence as to the merits of this remarkable machine. Very truly yours,

\$1,000 CHALLENGE ACCEPTED,

PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

THE "TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

A Tereido-Proof Pile Covering.

The accompanying engraving represents how wharf-piles are protected from the ravages of the tereido, limnoria and other marine insects by the Anderson & Elias tereido-proof pile covering, after they are driven and placed on a wharf. The piles are always attacked between high and low water, or down to the mud. The piles are prepared and covered before they are driven with a steel, iron or galvanized iron jacket which is tightly fitted.

The pile is first stripped of its bark and properly smoothed down to a straight line. After that it is covered with hot coal tar mixed with asphaltum. The jacket is then riveted firmly in place around the pile so that underneath it is perfectly water-tight. The jacket has flanges with holes to receive rivets every three inches.

The greatest trouble in driving piles prepared by ordinary methods has been in driving them without injuring or loosening the covering, or preparation. Coverings nailed or cemented on are shaken loose by the heavy jar caused by the blows in driving. In this instance no nails or spikes are used to secure the covering, only one single bolt through the top of the jacket passing through the pile. Driving the pile will not loosen the jacket; neither will the motion of ships alongside the wharves in stormy weather, as the spring of the pile will be between the jacket and the mud.

The metallic jackets and flanges add strength to the piles, and it is claimed that 800 piles prepared in this manner will make as equally strong a wharf as 1000 ordinary ones by being put further apart. The difference will about cover the cost of preparing them. The company is of the opinion that an eight-inch steel-jacketed pile will be as strong for service as the bare 12-inch pile.

Numerous inventions to ward off the attacks of limnoria and tereido have been made. The destruction caused by this worm and insect in the different harbors of this country is estimated at about \$3,000,000 every year, and piles in many places only last from two to five years. The metal-jacketed piles can be prepared and shipped to any part of the world without injury to the covering which protects them.

This company claims that the reason so many others have failed to preserve piles is that the majority have tried to poison the wood by injecting different liquids into it; but the tereido does not live on the substance of the wood, but merely bores a hole for a habitation and enlarges it according to its growth. Even with arsenic in the wood, the tereido bores as long as he has salt water from which to draw nourishment. Creosote, they claim, is also ineffective for the same reasons, though very costly experiments have been made with it.

When copper or other metal is nailed to piles, the jar of the pile-driving hammer loosens the fastenings and holes are left for the tereido to enter when any of the nails drop out. In this way they get access to the wood. By riveting the jacket around the pile there is no chance for any hole to be made in the wood. "The limnoria or grebble attacks the piles in shallower water than the tereido, and more so around a rocky bottom. The theory of these inventors as to the habits of the insect is this: They are much like a shrimp in form, but only about one-sixteenth of an inch in length. They have many legs, and the two hind ones are quite long, so that they spring or

jump like a grasshopper. They attack a pile or piece of wood which is stationary and will destroy it in a few months by steadily jumping on to it. It has never been discovered whether they live off the wood or merely stay there for a place of habitation. No wood is too hard for them to penetrate. They only attack a few feet of the pile, but finally cut it off trans-

Pacific Coast Steel and Shipbuilding.

Some of the Eastern shipbuilders seem to be rather jealous of the success made by the Pacific Rolling-Mills of this city in the matter of manufacture of steel castings for the new cruisers. An interview with Mr. Cramp, the builder of the Baltimore, represents him as

the Union Iron Works were based upon their making the steel castings. That they did make them is in evidence by the fact that the Charleston was launched July 19, 1888, the Baltimore October 6, 1888. The Pacific Slope does not like to follow in anybody's wake. The statement that the rolling-mills had to send East to Chester for a foreman who had been trained in the Standard Co.'s works before they could make a success of the casting, is also incorrect. The man referred to only came in August as foreman molder, not steel-maker, and the Charleston's castings were made before he arrived.

As before stated in the PRESS, the steel made here at the Pacific Rolling Mills for the Union Iron Works to put into the cruiser Charleston is of exceptionally fine character. It has been highly commended by the Government inspectors, and also officially by the Secretary of the Navy, and has given satisfaction to all except rival builders.

As Mr. Scott says, our Pacific Coast weather and good steel castings help shipbuilding amazingly. This industry is only in its infancy among us. The enterprise of the Union Iron Works in building such an establishment as they have and so successfully accomplishing any work intrusted to them, has proven not only to ourselves, but to the people of the country, that the shipbuilding industry will flourish here. Our timber resources are unsurpassed for building ordinary vessels, and now that the big shipyard on the Potrero is in running order, we have proven that iron and steel vessels can be as profitably constructed.

THOMAS PRESTON, superintendent of the Sierra Buttes gold mine, Sierra City, died in this city on Monday last after a brief illness. Mr. Preston was a native of Manchester, England, and was 43 years of age. He entered the service of the Sierra Buttes Company in a subordinate capacity about 1872, and has continued with them since, for a number of years past, as superintendent. The company employs several hundred men, and the works are the most complete in Sierra county. The mine is the deepest worked gold mine in the world, a tunnel now approaching 9000 feet in length tapping the vein at a depth of 3000 feet, from where it was worked at the drop-pings. Mr. Preston has managed the mine not only to the satisfaction of the company, but of the employees. The writer of this paragraph passed several weeks with him at the mine not very long since and can cordially testify to the reputation Mr. Preston had achieved as a hospitable and genial gentleman. He was well known and liked throughout the region where he lived, and was recognized as an upright, honest and capable man.

MR. LOUIS BLANDING has shown the editor of the Sonoma Banner a contrivance to be attached to mining cars used on inclines. It is placed on the front end of the car and is so arranged that if the rope should break a clasp falls and catches an iron plate fastened to the ties. By such an arrangement it would be impossible for a car to rush down when a rope gives way.

THE new steamer Yaquina Bay, in making her first trip from San Francisco, went ashore at Yaquina bay. It was at first thought she would be a total loss, but it is now hoped she may be saved.

IRON-JACKETED PILES FOR WHARVES.

versely." The inventors of this covering are confident that they have solved the problem of preserving piles. They have formed a company for building wharves and piers under this patent. The directors are: Senator A. J. Meany of Merced; Hon. James A. Orr, Hon. John Gamble, James M. McCarty, M. McCarty and Ben F. Kohlberg of Stockton, and L. H. Anderson of San Francisco. The president is A. J. Meany, secretary L. H. Anderson, and treasurer J. M. McCarty. The general manager is Henry Anderson of this city. A pile 65 feet long, prepared in the manner described, is on exhibition in this city at the corner of Lombard and Battery streets, near the seawall.

rather disparaging the steel made here for the Charleston, and claiming that "only one of the great manufacturers of steel in the United States—the Standard Steel-Casting Co. of Chester, Pa.—had the courage and energy to undertake the work of making the steel castings for the cruisers."

Mr. Scott of the Union Iron Works, which built the Charleston and are building the San Francisco, very properly contradicts this statement. He says as it applies to the Pacific Rolling-Mills it is untrue. They contracted to make the steel castings for all cruisers the Union Iron Works might obtain before any bids were opened at Washington. The bids of

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Alien Ownership of Tin Mines.

EDITORS PRESS:—Having read your article in the issue of Oct. 20th on the subject of "Alien Mine-Owners," I find that a committee of Congress has been appointed to investigate and report at the next session of that body. Now, while I agree that it is all very well to allow aliens to hold mining property of certain kinds in the States and Territories, but not all kinds, it is well known that foreigners buy gold and silver mines for the purpose of making and realizing a profit on their investment; and as those metals are always of a stipulated value, the sooner they can realize an income from them the better it is for the stockholders. But it is not the case with all kinds of mining. I allude more particularly to the article of tin. Now it is well known that English capitalists have monopolized and almost controlled the tin mining of the world, with perhaps the exception of the Dutch East India Company, who operate on the Island of Borneo in the East Indies.

The tin mines of Cornwall have been worked almost from time immemorial, according to statistics—say from 1500 to 2000 years—and the stock in those mines has been handed down from one generation to another to enrich a few at the expense of the whole world.

Now we have within 100 miles of this place, in the county of San Bernardino, at Temescal mountain, an immense deposit of tin ore, enough to supply the United States hundreds of years to come. This mine has been looked up with a lawsuit for over 25 years, and, if reports are true, it has only been decided a short time ago, and it is also reported that two Englishmen have been kept there to watch it all this time, and they are paid regularly from some source, but no one seems to know where it comes from. According to reports published in your paper, there are also large deposits of tin ore at Mt. Harns, in Wyoming Territory, of both vein and stream tin in inexhaustible quantities. There are also tin mines in Mexico, but there is no account of any shipments from that country. All the tin seems to come from England; and whenever a tin mine is discovered in any part of the world, an agent from England appears on the ground to investigate its extent and value, and if it is of importance enough to create a competition to their monopoly, what is the most likely thing for them to do? Of course, buy it, and lock it up. We hear of no tin being produced in Wyoming Territory, although we had reports of a company being organized in New York over two years ago to operate them. Have Englishmen been over and bought them off?

But why should they buy them off? For the very best reason in the world. It is well known that the mines of Cornwall are now being worked to a great depth, and miles under the sea; and in order for the stockholders to get dividends from them, they have got to keep up the price of tin to 22 and 25 cents per pound. It is said they work ore that only yields five per cent, and even as low as three per cent. What could they do in attempting to compete with American tin, where you can go and dig it out of the surface, that will yield 15 and 20 per cent, as it does here at Temescal? Now, if Cornwall miners can make it pay to work five-per-cent ore at 25 cents a pound, 15 and 20 per cent ore ought to be made pay, even to sell it at 15 cents a pound. Tin is a metal that as yet has been found in few places in the civilized world, and I do think that if Congress passes a law allowing foreigners or aliens to hold mining grounds in this country, there certainly should be an exception made in regard to tin miners. Tin is a metal that enters largely into scientific and domestic use, and to allow it to remain a monopoly in the hands of alien mine-owners, to be looked up or worked at their option, I think certainly would be one of the greatest mistakes that Congress could possibly make. At this very time a child cannot take a drink of water at the spring out of a tin cup without being indebted to England for that cup.

I venture to say that if aliens are allowed to buy and hold those mines, there will not be a pig of tin produced in the United States for the next two generations to come. Can the United States afford to do that when we are paying millions every year for foreign tin?

N. A. BEGOLÉ.

San Diego, Nov. 28, 1888.

[The alien law in regard to mines is not to apply to States, but to Territories. Whatever is finally done in the matter by Congress will have no reference to the subject in California or any other State of the Union, but will to the Territories.—Eds. Press.]

Mineral and Agricultural Land.

EDITORS PRESS:—It is generally conceded here among the mining class that the owners of agricultural patents, or the possessors of such, almost invariably have rich gold-bearing ledges upon the land. There is not a piece of patented land in this district but what has rich ore. In other words, productive mines. No person or persons can deny this.

Wiser's patented land has numerous pro-

ductive ledges that give an "A No. 1" showing for a big mining property. Also Miller's, better known as the Myers ranch, not less valuable than the former for mining purposes. Debrasky of Shasta, Georges of Shasta, and B. Swasey, all owners of patented land, have valuable gold-bearing quartz ledges on the land. Otherwise the mere land and timber is worth nothing until after five years of toilsome life. Some ledges are productive from the grass-roots, and the ore can be brought to the mill with but little expense. Here these ledges lie undisturbed, and will, perhaps, for many years to come. The Government has set aside our mineral land district from the agricultural land districts, and why do not the miners of this district join hands and prove up our mineral resources? J. C. FRICK.

Lower Springs, Nov. 25, 1888.

The Gold-Quartz Region of Idaho.

EDITORS PRESS:—The old placer region in Idaho, viz., about Leshburg, Salmon City, Gibbonsville, and on west to Warren's and Florence, is a most excellent quartz field. During the past year quite a number of rich discoveries have been made. It is free-gold quartz, from a granite, slate and porphyry formation. The veins are all sizes up to immense fissures. This great gold-field is about four times as large as the Black Hills of Dakota. Quartz mining in Idaho is still in its infancy. The day is coming when this great mineral belt will be the most important as a gold-silver producer of any other portion of the Northwestern Territories. Most of this Salmon-river region is yet unprospected. It is a rough, broken country, consisting of numerous mountain ranges running in all directions—a regular panorama of ruggedness. The geological character of the country is profoundly varied. In fact, about all rocks are represented in this section, especially the older series—volcanic, metamorphic, crystalline and sedimentary. A great many of the metalliferous veins are contacts, still there are numerous fissures in the broad zones of granite and porphyry. The country is well watered and timbered. Various kinds of game abound in this mountain region, such as elk, moose, deer, bear, mountain sheep and goat. All the larger creeks, rivers and lakes contain trout and salmon. It is a delightful country during the summer season for the prospector, and now since the Indian troubles are all over, there is no reason why this most desirable mining country should not be explored and the mines developed. Several railroads are heading this way, and it will only be a few years when the great mineral resources of this region will be known to the mining world. It will be made known by the stream of precious and useful metals that will flow from these rugged mountains of Idaho. The mines are here in goodly numbers, and their development will give fortunes to the fortunate owners. In a future article the writer will endeavor to give a more specific account and description of some of the gold-quartz mines that are now being worked in this Salmon-river region.

CHAS. F. BLACKBURN,

Salmon City, Idaho.

Careless Prospectors.

We have had occasion heretofore to refer to the practice of writing out location notices so vaguely that no one can tell the exact whereabouts of the property intended to be claimed. We condemn the practice decidedly, but it prevails to a considerable extent through ignorance and carelessness. Many notices are posted which contain no reference to immediate surroundings and no definite description by which the particular ledge sought to be claimed may be distinguished. Some of them may be moved a mile and made to apply to other than those ledges upon which they were originally posted. This is wrong, and not only wrong, but positively unlawful. The law contemplates that the posted notice shall describe the property in such a definite manner that no mistake can be made as to the exact location of the ground intended to be claimed, otherwise it is imperfect and illegal. It is just as easy to accurately describe a ledge as it is to write a shambling notice that "the undersigned" claims a ledge somewhere in Homer district, and by so doing the locator protects himself from intrusion and litigation. Half the disputes about mines originate in neglect to build proper monuments and in the posting of imperfect notices. Locators will do themselves and the district a service by complying with the letter of the law.

A claim must be fairly defined in some manner, and the law says distinctly that it shall be so described that any well-intentioned person may readily find it after an examination of the records. And the Index would give another hint: A vein must first be found before a location may be made. It is not sufficient that A has discovered a ledge and B locates an extension on the supposition that it continues its course into adjoining ground. B must also find it, or C may come in and discover it, in which case B is left out in the cold and has no rights in the premises which C is bound to respect.—Homer Mining Index.

The London Exhibit.

No enterprise of greater importance has come before the people of California since the State was organized than the proposed exhibition of her products in the City of London.

What will it do? In connection with the development of the resources of the State, the chief object to be sought for is an outlet for her products at the highest prices which the world is prepared to give. These prices we have hardly been in a position to obtain hitherto. The reason is apparent, because the product is new, the State is new, and the laws of distribution are only to be mastered by many years of trial and experience. Our early efforts met with encouragement until the time came when the production increased in so great a ratio as to make the problem of disposal and distribution one far too difficult for the experience of our producers to master. This same difficulty will only increase with time, as more available land is put into fruits and vines, and the endeavor to overcome this difficulty by inducing further immigration will only tend to complicate the chances for success, and make more certain the tendency to glutted markets and ruinous prices.

What must be done to right matters and bring us a profitable return for investment and labor is to find new avenues for disposing of and distributing those goods which we have and are likely to have. This can best be done by bringing to the centralized markets of the world our products and obtaining for them the highest ruling prices.

An exhibition in London would afford the most speedy method of bringing about the desirable state of affairs, consistent with the prosperity and growth of our State.

It may be asked whether it is desirable for us to try to compete with the pauper labor of Europe—for it is implied that we would aim to do so were we to exhibit our products in London. Were the State depending on manufactured goods, the product of hand labor and manipulation, it would scarcely be possible for us to succeed, but when we take into consideration that the articles we offer for sale are mainly the productions of new and fertile lands and are produced by the aid of labor-saving machinery, and when we further consider that our land-ownership in California is a simple affair, that every box of raisins or can of fruit has charged upon it only a State and county tax and incidental expenses of interest on investment, as against the old feudal systems of European land-ownership, where the tiller of the soil is a sub-renter, above him a larger renter, negotiator or agent—above him the lord who owns the land, above him an immense navy (Spain, for instance, has a navy second only to that of Great Britain, without India to support it, a great standing army, an aristocracy and a king), when it is taken into consideration that all of this body take their pay out of the box of raisins or can of fruit, we do not hesitate to aver that we can compete with the similar productions of Spain and Italy, and do so to our advantage, just so long as our system of land ownership exists as against that in vogue among the people of Europe. So true is the above proposition that we need only point out the fact that we have been able to supply bread and meat to the people of Europe, and were it not for the protective tariff of Austria, Spain, Italy and Germany, it would be impossible for the people in these countries to till their soil in competition with ours at all.

The question before us is of the utmost importance; it deserves the active co-operation of every one interested in the products of the State, and demands prompt and effective action.

Below are the names of the representatives of the various counties who are to meet in convention at San Francisco in the Chamber of Commerce on Tuesday, Dec. 18th, at 10 o'clock A. M. It is imperatively necessary that each and every delegate should be present, and each county should see that its own man is on hand, or represented by an efficient substitute.

The plan of the proposed exhibition has been warmly indorsed by the people of Southern and Central California, and some of the leading northern counties of the State. There should not be a single county unrepresented in the coming convention, for the work to be considered is of moment to each and every one of them.

Let each county make a grand effort to be represented properly in the London Exhibition and thereby insure a complete success for the entire State.

When once we have obtained a firm foothold in the markets of the world, and our products bring remunerative prices, it will no longer be necessary for us to go out seeking settlers and investors. Capital and energy will flock to California because it will be profitable for them to do so, and our State will enter upon a career of progress and greatness unequalled by any other in the Union.

Let all attend the convention, then, and let each county see that it is surely and properly represented at the Chamber of Commerce in San Francisco, on Tuesday, December 18th, at 10 o'clock.

Below will be found the names of the representatives chosen by the State Board of Trade:

Alameda—J. S. Emery, E. W. Playter, V. D. Moody and M. J. Kellar.
Alpine—Judge N. D. Arnot.
Amador—A. Caminetti.
Butte—John Bidwell, D. N. Friesleben, E. T. Reynolds and E. W. Fogg.

Calaveras—C. V. Gottschalk.
Colusa—Dr. R. A. Grey and J. B. De Garnett.
Contra Costa—E. B. Smith and Dr. Strentzel.
Del Norte—W. H. Woodbury.
El Dorado—Henry Mahler and Thos. Frasier.
Fresno—Thos. E. Hughes, A. B. Butler, T. C. White and Louis Einstein.
Humboldt—John Vance.
Inyo—Patrick Reddy.
Kern—R. E. Houghton and C. W. Brower.
Lake—D. C. Ramsey and P. B. Graham.
Lassen—C. C. Hutchinson and E. B. Spencer.
Los Angeles—Eugene Germain, E. W. Jones, Dr. J. P. Widney, M. L. Wicks and J. B. Lankershin.
Marin—F. C. de Long and Wm. T. Coleman.
Mariposa—Major Ben. C. Truman.
Mendocino—J. Mervyn Donahue.
Merced—H. H. McCloskey and Geo. H. Bonfield.
Modoc—J. J. Reavis.
Mono—W. B. Thompson.
Monterey—Jesse D. Carr and W. Nance.
Napa—M. M. Estee and Leonard Coates.
Nevada—C. W. Kitts.
Placer—A. P. Hall and P. W. Butler.
Plumas—C. Lee.
Sacramento—Dr. G. L. Simmons, Eugene J. Gregory, David Lubin, Chas. K. McClatchy and S. E. Carrington.
San Benito—Dr. Thos. Flint.
San Bernardino—L. M. Holt, J. G. Burt and A. S. White.

San Diego—Frank A. Kimball, T. S. Van Dyke and Chas. B. Turrill.
San Francisco—M. H. De Young, Col. J. P. Irish, G. K. Fitch, W. R. Hearst, Capt. W. L. Merry, Wm. H. Mills, Frank Dalton and A. T. Dewey.

San Joaquin—L. U. Shippee, S. D. Woods and J. A. Morrissey.
San Luis Obispo—J. M. Fillmore and W. D. Haley.

San Mateo—Timothy Hopkins and Alexander Gordon.

Santa Barbara—Ellwood Cooper.
Santa Clara—T. Beach, N. Cadwallader and W. C. Andrews.

Santa Cruz—John A. Shivor.
Shasta—C. W. Pope, T. W. Shanahan and Fred H. Deakin.

Sierra—Daniel Cole.
Siskiyou—Hon. John Daggett.
Solano—G. N. Platt and G. P. Plaisted.

Sonoma—H. W. Byington and John Adams.
Stanislaus—J. B. Caldwell and E. B. Beard.
Sutter—R. C. Kells.

Tehama—N. P. Chipman and Bruce B. Lee.
Trinity—W. J. Tinnin.

Tulare—W. R. McQuiddy and Capt. Thompson.
Tulumbine—J. D. Nicholls.

Ventura—H. M. Newhall.
Yolo—Chas. W. Reed and R. B. Blowers.

Yuba—J. B. Montague.

Gravel Mining.

The Industry as Now Prosecuted.

It is very certain that the auriferous gravel belt of California is far from being exhausted, remarks the *Call* editorially. The surface has been scratched; but that surface is merely the comparatively modern covering which dates from the later quaternary, in some places overlying the beds of the old rivers. Here and there a few of these old beds have been discovered and exploited for a few hundred feet. But by far the greater portion of them are buried under so deep a deposit of volcanic matter and detritus that they have never been reached. Portions of Mariposa, Tulumbine, Calaveras, Amador, El Dorado, Placer, Nevada, Sierra and Plumas are underlaid with gold, and sooner or later it will pay to delve for it and get it out. The gold-bearing belt may, indeed, run from the extreme southern limits of the State into Oregon. There are more chances that it does than that it does not. How much gold it does contain the most fertile imagination cannot presume to conjecture; but judging from what has been found in grubbing here and there in the old river channels and bars the quantity must be large.

The student of science will amuse himself by constructing theories to account for the presence of gold in the gravel. To the man of business it is enough to know that gold is there, and that with labor directed by skill it can be got out. There must have been a time when the surface of California was intersected in every direction with rivers and streams which flowed from a golden source; when the mighty power of water eroded this source and carried the gravel down, the gold came with it, and the fable of Paeolus was repeated in almost every portion of the State. Then came the period of volcanic overflow, and the age of natural detrital deposits, during which these great treasure vaults were hidden under vast layers of lava and dirt. It is the business of our time to reverse the process, to tear away the upper cloak of lava and debris, and to get at the river-beds where the precious metal was deposited by the water, and lies in its gravel envelope. In a word, the gold of the future in this State bids fair to be found rather in the "high gravels," which must be reached by sinking and tunneling, than in quartz veins. This will not be as easy work as the washing of the fifties, when a lucky miner on a rich bar cleared his thousand dollars a day. But with skillful direction and good luck, the industry may pay very well.—*Nevada Transcript*.

IMPROVEMENT IN TRACTION WHEELS.—In an invention relating to wheels for traction engines, made by Boulton, Ashton-upon-Tyne, England, wooden blocks are inserted in the face of the wheel, these blocks resting upon a cushioning material. This, it is said, effectually avoids the jar and shock incident to the running of such engines.

The Metropolis of the North.

No doubt many readers of the PRESS who hear so much of progress and development in our sister State, Oregon, will be pleased with a glimpse of the city of Portland from a recent photograph. To give also an idea of the picturesque surroundings of the city we include a sketch taken when Portland was a much smaller city, but which has the merit of showing the valley and the majestic Mt. Hood towering above the lesser heights which lie eastward of the city.

The city of Portland is situated on sloping ground, with the river on one side, and on the other a range of hills, which, within easy walking distance, rise to an elevation of several hundred feet above the river, and which afford the most picturesque building sites in the world. From the streets of even the thickly settled portions of the city, the Cascade mountains, with the snow-capped peaks of Hood, Adams, St. Helens and Rainier, are in plain view—the first named at almost any stage of weather, the latter three upon a moderately clear day. As the hills to the west of the city are ascended,

population of the city will be increased to 60,000 and over. The construction of two iron bridges across the river has done much to strengthen the feeling toward consolidation, and it would seem that corporations which are so closely identified in business interests should be one in fact.

As a center of transportation Portland equals, if it does not excel, San Francisco. She has competing transcontinental connection over three lines of railroad—the Northern Pacific, the Union Pacific (via its Short Line and the O. R. & N. Co.) and the Central Pacific in conjunction with the Southern Pacific. Three other local lines converge here, which extend southward and tap the rich agricultural region of the Willamette valley. The railroads which now center at Portland were not built by the people of that city, nor with their capital; but they were built for the same reason that the trade and commerce of the country centered here before their construction, and the cause for both is in the general lay of the country. The city is located at the confluence of the Columbia and Willamette rivers, at the point of discharge of a natural funnel, of which the mountain ranges act as the sides, bringing the waters, and with the waters the trade and com-

United States Mints.

Dr. Kimball, Director of the Mint, has submitted to the Secretary of the Treasury his report of the operations of the Mint service for the fiscal year ended June 30, 1888. The value of deposits of gold was \$80,894,456, including \$8,668,959 of redepósitos. The deposits and purchases of silver were 39,941,507 standard ounces of value, at a coining rate of \$41,822,846. This included redepósitos of the value of \$491,831. Of the gold deposits, \$32,406,306 was classified as of domestic production, against \$32,973,027 in the preceding year. These figures tend to a reduction of half a million of dollars in the production of gold in the United States. Foreign gold bullion deposited aggregated \$21,741,042, and foreign gold coin \$14,596,885, a total of \$36,337,927, against \$32,467,840 in the year preceding.

The value of United States light gold coin deposited for recoinage was \$492,512; old material was deposited in the form of jewelry, bars, plate, etc., containing gold of the value of \$2,988,750; of the silver bullion deposited and purchased, \$37,393,648 (32,315,156.79 standard ounces) was classified as of domestic production, \$1,668,384 as foreign silver bullion, and \$87,336 as foreign silver coin. The total coinage was 109,030,547 pieces, of the value of \$63,719,242, of which \$28,364,170 was gold, \$32,718,672 in silver dollars, \$1,417,422 in subsidiary silver coin and \$1,218,976 in minor coins. The minor coinage of the Mint of Philadelphia was the largest in the history of the Mint service, being occasioned by the demand for five-cent nickels and one-cent bronze pieces.

Gold bars were exchanged for full weight United States gold coin as authorized by the Act of May 26, 1882, of the value of \$15,846,936, against \$7,604,059 in the preceding year. Silver

The aggregate coinage of the world, including recoinage, during the calendar year 1887, was \$124,992,363 of gold and \$160,985,877 of silver. The value of gold bars furnished for industrial use during the calendar year 1887 was \$11,672,606; silver bars, \$5,241,998; total, \$16,914,604. The stock of gold and silver coins in the United States on July 1, 1888, is estimated to have been: Gold coin, \$595,349,837; silver dollars, \$299,708,190; subsidiary silver coin, \$76,406,376. At the same date there was gold bullion awaiting coinage in the mints to the value of \$110,469,013, silver bullion \$3,950,388, and melted trade dollars \$1,092,439,963. Of this there was in the Treasury of the United States \$594,533,172, in national banks \$105,435,492, and in other banks and in general circulation \$392,461,299.

The Engineers' Code.

The following signals, taken from the standard code, are used by the majority of the locomotive engineers employed on American railroads:

The sign **O** means a short, quick sound, while the dash — means a long sound.
 Apply brakes, stop **O O O**
 Release brakes, start **O O O**
 Back **O O O**
 Highway crossing signal — **O O O** or **O O —**
 Approaching station, — blast whistle 6 seconds. **O O O O**
 Call for switchman **O O O O**
 Cattle on track **O O O O**
 Train has parted **O**
 Railroad crossing, same as approaching station. **O O O O O**
 For fuel **O O O O O**
 Bridge or tunnel warning **O O —**
 Fire alarm **O O O O**
 Will take side track **— — —**

Red signifies danger; green signifies caution, go slowly; green and white signifies stop at flag stations for orders for passengers or freight. One cap or torpedo on rail means stop immediately; two caps or torpedoes means reduce speed immediately and look out for danger signal.

A MINER'S BAROMETER.—“We will have snow or rain before to-morrow, and the storm will be a heavy one,” remarked a veteran miner yesterday. “My barometer is infallible. I am working in a long tunnel, and when the

EARLY VIEW OF PORTLAND, THE WILLAMETTE AND MT. HOOD IN BACKGROUND.

A GENERAL VIEW OF THE CITY OF PORTLAND, OREGON.

the view broadens, until from the extreme top of some of the higher points there is a panoramic view unequalled in few localities in the country. But not alone has the resident of Portland these advantages of a beautiful outlook over the face of Nature. To the glaciers of Mt. Hood is but a little more than a day's travel; the gorge of the Columbia may also be visited within the compass of a day; the upper Willamette, within the limits of a few hours' trip, offers beauties equaling the Rhine; while 36 hours gives the lower Columbia, beside which the Hudson sinks into insignificance. Within a few hours' walk are beauties rivaling the White mountains, and the grandeur of the Alps lies within the limits of a day's picnicking. Upon the higher ground of the city many elegant homes have been made. A city park, overlooking the river and valley, has also been laid out, and is being rapidly improved.

Portland has a present population of 50,000. All movement is now on foot, by petitions to the next session of the Legislature, to bring about the annexation of East Portland, and possibly Albina, both on the opposite side of the Willamette river. If this is effected, the

merce, of a great extent of country together at her doors. Between the Coast and Cascade ranges of mountains is a stretch of fertile lands, in extent double the size of Massachusetts, which is compelled to seek its outlet at Portland. The country to the north and east of the Columbia is also largely tributary to Portland, and the city finds a great business at present in supplying this vast territory with goods and receiving in return its grains, stock and minerals.

At the taking of the census of 1880, Portland was the third wealthiest city in the world in proportion to population. Among all her wealthy men, not one can be singled out who did not make his money in that city—who did not come comparatively poor to grow rich by his well-directed labors. The same causes that made Portland grow in wealth in the past are at work to-day causing the increase of her trade and wealth. She can now point to a jobbing trade of \$60,000,000 per year, which is a fair index of the extent of her relations with the regions penetrated by rail and reached by river from this focal point of the North-west.

ver hers were manufactured to the value of \$59,313,015, and 1397 medals were manufactured. The average cost per fine ounce of all silver published for the standard dollar was 095.47.

The seignorage on the coinage of silver dollars during the year was \$8,407,922, and on subsidiary coinage \$71,191. The seignorage on the coinage of silver from July 1, 1878, to June 30, 1888, amounted to \$47,536,680. The earnings of the mints and assay offices from all sources amounted to \$9,788,592, and the expenditures and operative losses to \$1,534,209. The total imports of gold coin and bullion during the year were \$43,934,317, and total exports \$18,376,234, or an excess of imports of \$25,558,083. There was a net loss of \$8,238,788 by the export of silver. The production of gold and silver in the United States for the calendar year 1887 is estimated to have been \$33,000,000 of gold and \$53,357,000 of silver. The production of gold throughout the world has remained nearly constant, while the production of silver has increased in the last four years about \$25,000,000.

weather is fair candles burn brightly in the face, but when a storm is approaching they burn more dimly, and when they are extinguished I can count on a storm in less than 24 hours to a dead certainty. This morning, before I had passed through one-half the tunnel's length, my candle was extinguished as suddenly as if it had been snuffed out, which conveyed a double warning—that a heavy storm was approaching and that I must take a holiday until it is over, as the extinguishing of the candle indicated that the light atmosphere outside would not admit of the foul air passing out of the tunnel, and where a candle will not burn in underground workings every miner knows a man cannot live.” The miner's simple barometer is certainly more reliable than modern weather prophets and costly mechanical devices for indicating the approach of a storm, as it began snowing in less than 12 hours after the above conversation.—*Virginia Chronicle*.

THE rigorous application of the chain-gang remedy has pretty nearly cleared Napa of tramps.

Passing Events.

The order to close down the Anaconda copper mines, M. T., followed next day by one to continue operations, grew out of differences between the mining and railroad company, and had nothing to do with the copper market. The mines are again being worked, greatly to the joy of the people of Anaconda.

While the abundant rains which have fallen in this State will stop the operations of river-bed miners, the water will set a good many mills going which have been entirely or partially stopped during the fall months.

The exhibition of California products by the State Board of Trade, which leaves this week for the East in two cars specially prepared for it, will prove an excellent advertisement for this State. The cars will be taken to different parts of the United States. The exhibit is permanently arranged for inspection.

Great attention is now being paid to electrical power for running quartz-mills and hoisting ore. The large plant on the Comstock will soon be ready for use, and in other places excellent practical results have been obtained.

The tunnel of the Hidden Treasure gravel claim at Auburn is now in 8000 feet, and the gravel is very rich.

Alien Mine-Owners.

The subject of alien ownership in mines is being investigated by the Government of the United States in view of probable changes in the Alien land law. We have several times referred to this subject, contending that no harm is done in permitting foreign companies to purchase mining property in the Territories of the United States. On the contrary, a definite benefit is the result. The companies buy the mines from the discoverers and develop the properties, putting up expensive plants and spending money in regions where money is needed. Many examples could be cited to show where the expenditure of capital has benefited highly not only our citizens, but the regions where the mines are located. Many of the ventures have been unprofitable, it is true, perhaps more of them than have shown a balance the other way, but this is perhaps due more to the fact that fancy prices have been paid to middlemen than to any other reason. Last week, during the visit to this city of Mr. Ivan C. Michels, statistician of the Committee on Mines and Mining, U. S. Senate, we questioned him concerning what he had thus far noticed in looking up this question, which was the principal reason of his presence on this coast. He said:

"On my trip to Utah, Idaho, Montana and Wyoming Territories, I have found so far the foreign capital invested, with very few exceptions, has been very unprofitable. The mines have been sold in England, France and Germany at very high figures, thus handicapping the mines from the start as to declaring dividends. Another cause of complaint is that parties have been sent from Europe who really have no knowledge of mining at all. They erect expensive works, getting expensive machinery, economize in no way, charge themselves with very high salaries, indulge in expensive living, and very seldom attend to business. There are more of these mines owned by aliens in Montana and Utah than any other places.

"I am on my way to Arizona and New Mexico, but so far I have not been able to get a full list of all the mines owned by aliens, but expect to have a complete one by the first of January."

Morongo Mining District.

The district of Morongo is in San Bernardino county, about 70 miles from the town of San Bernardino and 100 miles from Colton. By wagon-road, it is 60 miles from the S. P. R. R., an equal distance from the A. P. R. R., and 44 miles by trail from Whitewater Station, S. P. R. R. The miners make one day's drive from Whitewater Station. Only a few mines are thus far opened in the district, but some promising prospects have been made of late. There are no mills as yet, but arrangements are now being made for machinery.

Mr. Joseph Johndrew of this district was in the city this week, and from him we learn some facts concerning the mines. The most prominent one is the Morongo King. Water is obtained for the mine at Antelope springs near by, and a mile distant is a good millsite between the water and the mine.

The ledge runs northeast and southwest, and is about 15 feet wide on the surface. At the bottom of the shaft—200 feet deep—the ledge is about the same width, the ore improving with depth. The ore is all free-milling, and there are 200 or 300 tons on the dump ready to be worked. The owner has been working some of the ore in arastras to "keep going" during the past eight years. It has averaged about \$20 a ton in gold. In some places there are rich spots that assay up to \$500 and \$600 per ton. There is plenty of wood and water in the district.

Quite a number of miners are now in the district prospecting and working for themselves. The climate is fine and work can be carried on without difficulty all winter—in fact it is pleasanter to work there in winter than in summer, though it does not get very hot in these mountains. The district is not new, but is only now attracting outside attention.

A Volcano has broken out in the State of Tabasco, Mexico. The political chief of the municipality of Huamantla reports to Governor Sarlat that the mountain of Mono Pelado is in eruption.

Coin Certificates for Gold and Silver.

A bill introduced by Senator Stewart of Nevada in October last is a matter of interest to miners of gold and silver. It provides for the issue of coin certificates. Anybody having five ounces of gold or 80 ounces of silver may deposit them at any mint or assay office of the United States and receive full coinage value for the gold and silver deposited, thus virtually establishing the price of silver as \$1.29 per ounce instead of the present price of about 94 cents. This gold and silver is to be melted and formed into bars, and the coinage of gold and silver shall be done whenever there is a demand for coin. Should this bill be passed, it would abolish the Act of Feb. 23, 1873. The full text of the bill is as follows:

A Bill to provide for the issuance of coin certificates to circulate as money.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that any person may deposit at any mint or assay office of the United States either gold or silver bullion, or both, in quantities of not less than five ounces of gold or eighty ounces of silver, and demand and receive coin certificates therefor, at the rate of one dollar in certificates for twenty-five and eight-tenths grains Troy weight of standard gold, nine-tenths fine; and at the rate of one dollar in certificates for four hundred and twelve and one-half grains Troy weight of standard silver, nine-tenths fine.

The coin certificates issued under the provisions of this section shall be of such denominations as the Secretary of the Treasury shall prescribe, provided that they shall not be of less denomination than one dollar or more than one thousand dollars, and that one-half of the amount issued shall be in denominations less than fifty dollars, and shall be redeemable in gold or silver coin at the option of the United States. And the Secretary of the Treasury shall cause to be coined from time to time such portions of the bullion deposited under the provisions of this section as may be necessary to enable him to furnish coin for the redemption of such certificates.

The coin certificates issued under the provisions of this section shall be a legal tender at their nominal value for all dues, public and private, except where otherwise expressly stipulated in contracts heretofore made, and when such certificates shall be received for public dues they shall be reissued. And a sufficient sum to carry out the foregoing provisions of this section is hereby appropriated out of any money in the Treasury not otherwise appropriated. And the provision in Section one of the Act of February twenty-eighth, eighteen hundred and seventy-eight, entitled, "An Act to authorize the coinage of the standard dollar and to restore its legal-tender character," which requires the Secretary of the Treasury to purchase at the market price thereof not less than two million dollars' worth of silver bullion per month, nor more than four million dollars' worth per month of such bullion, is hereby repealed.

PLAIN AND TWISTED IRON.—Lieutenant F. P. Gilmore, U. S. N., who is here on duty inspecting the material used in the construction of war vessels, addressed the Technical Society on Friday last, on the relative strength of plain and twisted iron and steel bars. As the question had been raised whether iron rods used in the construction of cement sidewalks were weakened by first twisting them, in order to make the cement hold, Lieut. Gilmore volunteered to conduct some experiments at the Rolling Mills and the Union Iron Works, and submit the result to the society. A large number of tests had been made by him in the most accurate manner, and the result proved that twisted bars of iron or steel will bear a greater tensile strain than before being twisted. As many as 13 turns were made in a three-quarter inch steel rod eight inches long before it broke, while rods of iron of the same dimension broke at 3½ and four turns. Mr. Gilmore stated that iron and steel will bear a greater strain a few weeks after it has been manufactured than it will immediately after leaving the mills. He paid a handsome compliment to the Pacific Rolling Mills and Union Iron Works, and said he was not a little surprised on his arrival here to find such extensive and perfect plants for turning out heavy work, and particularly with the great variety of work handled by these concerns.

SENATOR REAGAN has introduced a bill for the free coinage of silver. It provides that all holders of silver bullion of the value of \$50 or more shall be entitled to have it coined into standard silver dollars of 412½ grains Troy to the dollar upon the same terms and conditions as gold is now coined for private holders.

QUARTZ showing good assays in gold has been found in Jimbo district, west of Mount Davidson, Nev.

Rolling Seamless Tubes.

A system of rolling seamless tubes from solid bars or ingots by what is known as the Mannesmann process is attracting great attention in England and Germany. Mr. Frederik Siemens described it in detail before the British Association, and the *Iron Age* gives his paper with engravings, which we reproduce, (see next page.)

The process consists generally in a method of rolling metal into seamless tubes, and it will contribute greatly to increase the use of steel. Tubes occupy an important place in the wants of mankind. Besides their use as tubes, properly so-called, they possess, also, the most advantageous form for columns, rods, axles, bearings, struts, etc. A given quantity of material can be formed into no shape so strong as the tubular.

Hitherto steel tubes could only be made with difficulty and at high cost by a complicated process with imperfectly welded seams and a longitudinal fiber. Now from a rough ingot of cheap steel with one, or at the most two, operations, a perfect tube without seam and with a circular fiber is produced. It may be seen from this bare statement how great is the importance of this invention. By the process in question tubes of great length and diameter, and of almost any desired thickness of metal, can be produced at a comparatively low cost.

At the present time, to roll a bar of iron, two horizontal rolls, as shown in Figs. 1 and 2, revolving in opposite directions, are used. If the section of the finished bar is required to be of any given form, grooves are cut around the rolls of the sectional form which the bar is required to assume. Passed longitudinally between the revolving rolls, the bar is forced into the grooves and reappears molded to the desired form. The rolls do not make the bar revolve, they act simply on its surface, drawing the material forward, and forcing it into the prepared grooves, at the same time elongate it and reduce its sectional area. The fiber produced in the finished product is, of course, longitudinal. Tubes are also made in this way. The prepared sheet of wrought iron is bent till the sides overlap and the longitudinal seam thus made is welded while passing through the rolls on a mandrel placed inside. The ordinary patent welded wrought-iron tubes made in this way have also a longitudinal fiber.

Another way (Figs. 3 and 4) of rolling is known and is used for straightening and polishing bars to which a rotating motion is imparted by two or three rolls revolving in the same direction. These rolls are for the most part placed parallel to one another, and the bar to be operated on is introduced in the direction of their longitudinal axis—that is, at the ends instead of at a right angle to the rolls. In such rolls the bar is not drawn forward but simply rotates, and if sufficient pressure is given the bar is elongated, but no decided fiber is produced.

Between the two kinds of rolling described above, which may for convenience be called longitudinal and circular respectively, another system of polishing and straightening bars and tubes occupies a kind of middle position. So also does the Mannesmann tube-rolling process. The systems differ, however; the first acts on the surface only of the bar or finished tube, whereas the latter actually makes the tube, and, in making it, displaces the material of the bar or ingot acted on, and imparts to it a fiber running in a spiral around it.

In both systems two or three rolls may be used together, turning in the same direction, and, consequently, imparting a rotating movement in the opposite direction to a bar laid between them. The two or more rolls (Figs. 5 and 6), however, do not lie normally, nor even parallel, but at angles to the axes of each other, and the axes of these rolls cross one another and that of the bar, forming somewhere in space acute angles in opposite directions with each other, and with the bar lying between them. When thus set the rolls act on the bar to draw it forward as well as to make it revolve—or, in other words, they impart to it a spiral movement. Though constructively both systems of mills may appear much the same, they differ widely in their mode of working and in their results. This arises from the position which the article acted upon and which we will continue to call a bar, is made to take up, and the very different action and form of the

rolls. In the Mannesmann machine a certain relation is maintained between the forward movement of the bar and its rotating movement, and if the proportion between longitudinal and rotary motion is properly adjusted to the special material acted on, the displacement in the substance of the bar is regulated so that a systematic twist is given to the fiber, by which not only irregular breakage of the material is avoided, but an energetic working action is secured, causing the great strength and toughness the tubes produced by this process are proved to possess.

The old straightening and polishing machine, although outwardly similar to the Mannesmann

rotates increases and it is drawn forward by each succeeding pair as they catch hold of it with ever-increasing speed.

It will be understood that a bar passing through such a series of disks, no slipping being possible, the material of which it is composed cannot retain its original area or volume. The diameter of the bar being regulated by the disks, while simultaneously a violent stretching action is carried on, the material required can only be drawn from the inside of the bar, and thus a hollow space is formed. Instead of this peculiar arrangement of disks, a conical or rather conoidal pair of rolls, which amount to the same thing as the disks,

A Plate Amalgamator.

In the ordinary amalgamating device which receives the ore pulp from the battery, the silver amalgamating plates are usually placed at a considerable inclination and a good deal of water is used so as to effectually carry away the sand. This object could not otherwise be accomplished in the use of the ordinary plates, because they are stationary, and if they were set at a slight inclination and but little water were used the sand could not separate easily.

Apolinaire Gauthier of Grass Valley has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency a plate amalgamator in

at will. Normally, the machine acts positively on its sills on the floor; but to move it closer to or further from the mortise, rollers are put in the sills, which wheels travel on fixed tracks on the floor. The wheels or rollers are in vertically sliding bearings, and can be moved up or down by hand-screws. When the machine is in place, the wheels or rollers are withdrawn into the sills, so the sills rest on the floor, but when the machine is to be moved, the wheels are projected so as to raise the whole machine up on the tracks, thus providing for its easy motion.

By the construction described, and shown in the engraving, the inventor is enabled readily to regulate the inclination of the machine, and to impart to it a necessary shaking motion, and at the same time he can adjust the machine perfectly with respect to the battery.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 250 Market St., S. F.

FOR WEEK ENDING DEC. 4, 1888.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DREDGER DIPPER.—Manley C. Lawton, Staten Island, San Joaquin Co. No. 393,439. Dated Nov. 27, 1888. The invention relates to that class of dredger dippers in which opposing jaws of the clam-shell pattern are pivoted to a carrying frame and are operated by a sliding crosshead connection and pulleys and chains. The ordinary clam-shell dipper has its jaws pivoted on a common shaft in the center of the frame, and they can therefore open only their own width. The advantage of the improved dipper is that, opening to such a width, it has a greater cut and freer dump. In this one the jaws of the dipper are pivoted in parallel planes by rods at the extremities of the dipper-frame, closing to the center and opening out their full width beyond the sides of the frame.

MECHANICAL MUSICAL INSTRUMENT.—George F. Wells, S. F., assignee of one-half to Manley C. Lawton. No. 393,450. Dated Nov. 27, 1888. This invention relates to that class of musical instruments in which a strip of suitable perforated paper is caused to travel over the apertures in the range, said instruments being of the general organ type, known as automatic. The invention relates especially to a power apparatus or motor for effecting the travel of the perforated paper. The main object is to provide a motor for this class of instruments of such a nature and so operated that, without interference with the main functions of the pedals—namely, that of operating the bellows, it shall transmit its power to effect the travel of the music-paper, permit variation of its rate of speed, and allow for its proper control, so as to give a variation of tune to the music according to the will of the performer. Means are also provided for rapidly rewinding the music-roll. The invention consists essentially in the combination, with power-transmitting mechanism by which the travel of the paper is effected, of a motor of suitable construction, whose operation is effected by springs, the power of which is developed and controlled directly or indirectly by the pedals. In connection with this is a suitable speed regulator by which the speed of the motor may be varied independently of the stroke of the pedals and of the consequent power transmitted to the bellows of the instrument.

ROLLING SEAMLESS TUBES BY THE MANNESMANN PROCESS.

tube-rolling machine, owing to the form and position of the rolls and bars, admits of no twisting and displacement of material, and, consequently, this machine confines itself to surface action, as, indeed, it professes to do by its title. The following remarks may assist in clearing up this singular difference, and explain the peculiar action of the Mannesmann roll, which, while acting on the outer surface of a solid bar, produces a regular hollow space inside the same—in short, a tube. To obtain a single forward spiral action of the bar, the

considered as joined together, may be provided. It follows that a bar or rod of suitable dimensions which is passed through the Mannesmann rolls will, provided its substance is sufficiently homogeneous and plastic, undergo a violent twisting and stretching action, the fiber being spun as is the fiber in a rope, on account of which the process may be called a torsional process. The bar in its passage through the rolls is twisted as thread is twisted in a spinning machine. As, however, it cannot be fed from the outside as is the thread, and as the diameter

which the plate surface is given a vibratory or shaking motion. The top frame of the machine which is shown in the engraving on this page, carries the amalgamating plates. This top frame is supported from sills by means of spring standards. The inclination of the frame and its plate surface is a very slight one. The upper end of the plate surface is just under the apron of the battery mortar and receives the ore pulp from it. The vibratory or shaking motion is imparted to the frame and plate surface by an eccentric upon a rotary drive-shaft

GAUTHIER'S VIBRATING AMALGAMATING PLATES FOR QUARTZ MILLS.

length of the rolls is immaterial; it will take place when the rolls are reduced to the form of thin disks. Supposing the disks to be infinitely thin, or what is the same thing, that their outer edges are reduced to a mathematical line and no sliding motion takes place, the bar must still move forward spirally, its spiral velocity being equal to the velocity of the outer circumference of the disks. If, instead of one pair, several pairs of thin disks of regularly increasing diameters are made to revolve on the same axes, the outer circumference of each disk will revolve with greater rapidity than the preceding one. The same bar is, however, drawn forward through the several pairs of disks, and thus, as each part of the bar enters successively a more advanced pair of disks, the velocity with which that portion of the bar

cannot be reduced on account of the action of the rolls, it is forced to draw on the interior for a supply of material. It will be seen that we have in the Mannesmann process a system of rolling as new as it is capable of producing effects hitherto not contemplated. The hollow in the interior of the bar is produced without the intervention of a mandrel. Though the bar is converted into a tube by the action of the rolls, a mandrel is generally used to finish and smooth the interior and enlarge the tube.

THE output of the Green coal mine at Cherillos, N. Mex., on Monday last filled 105 cars.

A BILL has been introduced in Congress to repeal the Interstate Commerce law.

extending transversely, this eccentric playing between jaws bolted up under the top frame. This eccentric is driven at a high speed, so that the plate surface is moved back and forth with a longitudinal shake on its spring standard.

The inventor claims that more quicksilver can be used on these plates without subjecting it to loss or waste, while at the same time the sand is disposed of without having to use much water. To effect these results this amalgamating surface is set at a very slight inclination, and more quicksilver is used. The inclination being slight, the quicksilver has little tendency to flow off, and by reason of the shaking motion there is no necessity for using much water, the sand being separated without it, and the quicksilver remaining. The inclination of the plate-frame and plates is subject to regulation

MECHANICAL PROGRESS.

"Mitis" Metal—What Is It?

The name "mitis metal" has recently been given to a peculiar modification of wrought iron or steel, by which such refractory metals are made more easy to melt than in their ordinary conditions. These castings are produced by adding small quantities of aluminium, or aluminium alloy, to molten wrought iron or soft steel. This addition has the effect of lowering the melting point of the iron, so that the contained gases are allowed readily to escape, and the metal is rendered so fluid as to run freely into the smallest mold. Mitis castings are easily welded and worked, and are good substitutes for complicated smiths' forgings in iron or steel. The strength and toughness of the cast metal being fully equal to that of the best wrought iron admits of extreme lightness in the castings; and by increasing the percentage of carbon, tools and parts of machinery may be produced of any desired degree of hardness.

These characteristics open a wide field of application for the new metal or alloy. This field will be still further enlarged by improvements which tend to cheapen the cost of aluminium, which enters somewhat largely into its composition.

A casting of "mitis" metal is entirely devoid of the brittleness of ordinary cast iron, being very much like fine wrought iron, and may be drawn out under the hammer, welded, punched, or otherwise worked. "Mitis" castings can be produced of any degree of hardness, and when, as already intimated, through the wonderful strides which are being made in the science of electricity, the electric furnaces are brought to such perfection that aluminium can be produced at a price which is not prohibitive, it would seem that castings of "mitis" metal will take the place of forgings very generally.

The name given to this metal seems to be very appropriate—the term "mitis" is from the Latin and means soft or mellow. It is applied more to the process by which its peculiar characteristics of softness, flexibility and ductility are secured, than to the metal itself.

Discovery and Method of the Process.

The discoverer of this process was Mr. Peter Ostberg of Stockholm, Sweden. In the process of the manufacture of "mitis" iron the wrought-iron scrap is melted in plumbago crucibles in a special reverberatory furnace fired with petroleum. The crucible is covered, and a hole in the cover corresponds with, and is directly under, a hole in the top of the furnace. Additions to the charge of the crucible are made through these holes by means of a pipe, thus avoiding the necessity of opening and cooling the furnace. Wrought iron fuses at a temperature of say 4000° Fah., and it would be necessary to heat it far beyond the point of fusion before it would be fluid enough to cast into molds and to make it possible to handle it before it would consolidate. Now, it is in this unheating that the iron absorbs gases, and consequently it is impossible to make solid castings in this way.

In order to obviate this difficulty, Mr. Ostberg has made use of the well known fact that certain alloys of metal possess a fusing temperature much lower than that of the metals composing them; and among these aluminium alloys are especially notable. In making mitis castings, a very small quantity, about five-hundredths of one per cent of aluminium, in the form of a seven or eight per cent aluminium alloy of cast iron, is added to the charge (about 60 pounds) of wrought iron in the crucible the moment this has been melted. The fusion point is at once once lowered some 500° and the charge, now an alloy of iron and aluminium, becomes extremely fluid and can be cast in the finest molds, while the great difference between its temperature and its fusing point gives all the time necessary for manipulating it without danger of its solidifying. The extreme fluidity of the charge allows the ready escape of gases, which otherwise would make a porous casting, and the result appears to be a remarkably fine, solid and tough casting of wrought iron.

These mitis castings are said to be from 30 to 50 per cent stronger than the iron from which they are made.

A singular and rather depreciatory circumstance connected with these castings is the fact that although the aluminium greatly increases the strength of the iron in a casting, it loses a large portion of that increase of strength after hammering, and returns to the strength and fibrous appearance of fracture of the original iron. This, however, is of but little consequence, as the castings need no hammering.

The alloys of aluminium and iron and steel have long been known, and reference is made to the addition of such an alloy to steel by Faraday only a few years after the discovery of aluminium; but this application to wrought-iron castings is both new and interesting. No other process melts wrought iron and thus produces a wrought-iron casting. An important change in the manner of making the molds is necessary, different grades of sand being required from the other styles of castings, while it is necessary to dry the molds before they are used.

Another noteworthy feature of this iron is that no annealing is necessary, the castings being ready for the market from the sand. The castings made are designed to take the place of blacksmith forgings, and an examination of their qualities shows the ductility of malleable

iron with a corresponding absence of the brittleness of ordinary castings. The castings are really not castings in the common acceptance of the term, though made from liquid metal, but are wrought iron molded into shape.

This patent process is now the property of Mr. Nordenfelt, of gun and ammunition notoriety. Not only is the improved process of melting being applied to the production of wrought iron and steel castings, but for other purposes, and wherever adopted it has proved highly beneficial. By the successful adoption of the process, a new era has been opened out in the iron and steel world. Wrought iron is now used in commerce by being rolled and hammered as near as possible into the form of the article required, and by the subsequent treatment of the engineer and machinist, planed, turned, bored, slotted, and otherwise shaped and manipulated; thus the articles desired are eventually produced at considerable cost. The mitis work is turned out perfect directly from the mold in any shape desirable. The process is now in use in Sweden, St. Petersburg, Russia, Sheffield, England, and in the United States.

CURIOSITIES OF ALLOYS.—The way in which an alloy of gold and copper or other metal is affected by a small quantity of impurity presents one of the most serious difficulties with which our case-makers and jewelers have to deal in working gold, and referring to this, in a lecture at Birmingham, Professor Austen of the Royal Mint said: "It may be well to demonstrate the fact. Here are 200 sovereigns. I will melt them, and will add, in the form of a tiny shot, a minute portion of lead amounting to only the 2000th part of the mass; first, however, pouring a little of the gold into a small ingot, which we can bend and flatten, thus proving to you that it is perfectly soft, ductile, and workable. The rest of the mass we will pour into a bar; and now that it is sufficiently cold to handle, you see that I am able to break it with my fingers, or, at least, with a slight tap of a hammer. The color of the gold has become orange-brown; and the tenacity of the metal has been reduced from 18 tons per square inch to only five." In the same lecture Professor Austen said: "Here is a bar of tin, two feet long and one inch thick, which it would be most difficult to break, though it would readily bend double. If only I rub a little quicksilver on its surface, a remarkable effect will be produced—the fluid metal will penetrate the solid one, and in a few seconds the bar will, as you see, break readily, the fractured surface being white, like silver."

HARD STEEL.—Some experiments have been made by M. Osmond before the French Academy of Science, showing that if a bar of hard iron be allowed to cool from a white heat to dull redness, there is a spontaneous disengagement of heat, and its magnetic properties suddenly change. In order to ascertain whether the result might be due to the heat set free by the modification of the iron, or if it required the presence of carbon, M. Osmond operated with iron containing from 0.16 to 1.25 per cent of carbon, and found the first phenomenon above mentioned to be due to the molecular transformation of the iron, and the second corresponding to a change in the relations of the iron with its carbon. It takes place in 675° O., when the thermometer suddenly stops and rises to 681° C., afterward resuming its regular fall as the metal cools. This was observed with steel containing 0.57 per cent of carbon; with only 0.16 per cent of carbon a much slighter effect of the kind was noticed about 749° C. With 1.25 per cent of carbon, the two effects appear to confound themselves. When the proportion of carbon is increased, the temperature of transformation of the iron seems to be lowered and that of recalcence raised, so that both come to coincide in hard steel.

MUSKET STEEL. says a correspondent of the *American Machinist*—J. Torrey—owes its peculiarities to the presence of the metal tungsten, which is usually obtained from its principal ores, wolframite, and resembles iron in properties physically, though not chemically. The steel in question is said to be made by mixing wolframite with its own weight, or about that proportion, of pitch, and adding this mixture to an ordinary crucible charge of steel, the whole being subsequently melted at a high temperature. It is claimed that the product is of great value as a tool steel, from the fact that it does not need hardening and wears very slowly indeed. The experience of machinists with it has been rather different. I have had a small experience with it myself, and have, in some cases, found it all that was claimed for it. In other cases, results were not so good. Perhaps the working of it was the trouble. At all events, it is a very difficult steel to work, and usually costs a blacksmith some time and patience. A uniform product, which would be like some samples I have handled, would be invaluable.

WEIGHT OF DIFFERENT KINDS OF IRON.—The average weight of a cubic inch of wrought iron is .28; of a pound; a cubic foot of steel averages to weigh 490 pounds; a cubic foot of cast iron averages about 450 pounds. The volume of one pound of cast iron is 3.84 inches.

CAR WHEELS last about 23 months on the Second-avenue line, N. Y. They are all bought of Frank H. Andrew of New York.

SCIENTIFIC PROGRESS.

Chemical Action Between Solids.

One of the most interesting papers read before the Washington Philosophical Society last spring was that by Mr. William Hallock on the formation of alloys at lower temperatures than the melting points of either of their constituents. Mr. Spring, a distinguished chemist of Belgium, has been pursuing researches in the same field as Mr. Hallock, and has criticised some of the latter's work. At the last meeting of the Philosophical Society, Mr. Hallock turned the tables on Mr. Spring by examining some experiments, a description of which had been published, to prove that chemical action takes place between solids.

Mr. Hallock placed potassium and sodium in contact, arranging a thermometer to register the temperature. As they united, the temperature fell 2° 4 C. below that of the room. A block of ice and one of rock-salt, the temperature of each being reduced 10° or 12° C. below the melting point of the ice, when brought into contact began immediately the formation of the solution of salt.

One of Mr. Spring's experiments to show chemical action between solids consisted in placing copper filings and sulphur in contact. The sulphur attacked the copper. Mr. Hallock doubted that this was a case of chemical action between solids, and prepared the following described experiment to satisfy himself: A piece of bright copper and a small mass of sulphur were placed near, but not in contact with each other. After a time the face of the copper was blackened by the sulphur. Thinking it hardly possible that particles of copper might fly across the space between them, Mr. Hallock then varied the experiment as follows: The copper and sulphur were placed in a glass tube, with a wad of absorbent cotton an inch thick between them. The experiment was varied in several ways, in one case the tube being filled with dry air, in another the air exhausted, and in a third the tube being filled with oxygen, etc. In every case the copper was affected by the sulphur, although in some more than in others. Mr. Hallock's conclusion was that the chemical action did not take place between the copper and sulphur as a solid, but that the active agent was the vapor of sulphur. In the same manner reaction took place between copper and mercuric chloride, the vapor of the latter passing through absorbent cotton.

Mr. Hallock does not deny that chemical action may take place between solids—indeed, he is inclined to think that it does—but he holds that Mr. Spring's experiments do not prove it.

A REMARKABLE SPRING.—A company has recently purchased the Siltzer spring at Saratoga, near London, England, with a view to utilize its waters for the purpose of liberating and storing, in liquid form, the carbonic acid gas with which it abounds. In carrying out the arrangements, made under the supervision of Mr. Oscar Brunler, a German expert, a remarkable discovery has been made. This Siltzer spring was discovered by Dr. Haskins about three years ago, and a drill was put down to the depth of 500 feet. At this depth an abundant supply of water was found flowing from a crevice in the rock bottom. Recently, to assure himself of the depth of this spring, Mr. Brunler ended it with a line and plummet; but, instead of resting at 500 feet, the weight sank the whole length of the line, 900 feet. Other soundings have since been taken, the weight used being a piece of one-inch gas-pipe filled with lead, and weighing 34 pounds, until a depth of 3300 feet had been reached, and yet without touching bottom or any obstacle. No further soundings will be made until instruments specially designed for the purpose can be procured. Mr. Brunler admits it as possible that the line and weight may have been carried away by some powerful current, but he holds to his belief in the existence of a subterranean sea of greater or less extent, and of there being undoubtedly some connection between it and the water of the ocean. In other words, Saratoga is over a vast water-filled cavern, the roof of which is about 500 feet thick. Mr. Brunler also thinks it probable that at a given depth and temperature carbonic acid gas may be found in a liquid form. His discovery appears to dispose of the various theories and scientific speculations regarding the origin of the Saratoga springs.

HOW MAINSPRINGS OF WATCHES, LAMP CHIMNEYS, ETC., BREAK.—Writing on the breaking of watch mainsprings, Mr. W. B. Croft of Winchester College says: My neighbors, Messrs. Jacob & Rose, watchmakers, often tell me their experience in the breaking of mainsprings. Unreflecting people fancy they have broken the spring by over-winding, or, in other words, have drawn asunder a piece of steel by the force of finger and thumb. The springs, of course, break through a subtle molecular change produced in the steel by atmospheric causes; they usually fly asunder a few hours after being wound, at three or four o'clock in the morning. Many watches and clocks come to the workshops for new springs after a frost, but not until a thaw has set in; still more come after thunder-storms. A watchmaker speaks of a clock spring which had not been placed in any clock, but which on being taken out of the case was found to be broken into 17 pieces;

there was a complete fracture in each coil along a radial line from the center. The same person had previously found one with three such radial lines of fracture. Of course this subject is not new, but it gains by recorded experience. Glass vessels, particularly lamp chimneys and globes, frequently fly into pieces from no apparent cause, and in positions in which they have been remaining for weeks and months. The writer was once sitting at his desk writing, on a summer's day, when the bottom of a lamp chimney, which had been lying in a pigeon-hole for weeks, suddenly snapped and flew off, landing upon the floor several feet from the desk.

IMPROVED TELESCOPES.—When the object-glass for the Lick telescope was ordered its manufacture was considered an exceedingly difficult task on account of its large size—36 inches. The great Russian telescope at Pulkwa was the largest then in existence and measured only 30 inches. The addition of 6 inches to 30 was a very large increase in size, and the final success of the casting was reached at very great expense and only after a large number of failures. Now, however, it is said that Mr. Clark has contracted for a 40-inch lens for this observatory to be erected near Los Angeles, and he further claims that, in consequence of the improvements and late experience in glass casting, he will now be able to secure and prepare for mounting a lens 60 inches in diameter—one which will bring the moon within a few thousand feet of the earth. It is simply a question of time and money—mainly money, as a telescope with a six-foot lens, properly mounted, would cost \$1,000,000. If Mr. Clark's position is true, astronomy, a science which has been practically at a stand for years, will take giant strides. There will be practically no limit to the discoveries it can make, and there should come from it some practical benefits. Each year we will know more of the heavens, and of all sciences astronomy will be changed from the slowest to the most progressive. Of the world's refraction telescopes nine have apertures exceeding 20 inches, viz.: Lick Observatory, California, 36 inches; Pulkwa, Russia, 30; Yale College, 25; Littrow, Vienna, 27; University of Virginia, 26; Washington Naval Observatory, 26; Gateshead, England, 25; Princeton, N. J., 23; and Buckingham, London, England, 21. Six of these instruments are the work of an American firm.

PILE-DRIVING.—Scientific investigation shows that when a pile is struck on the top what is known as a wave of compression passes through it, and this wave requires time for its passage. Such a wave is set up in all columns when stress is suddenly brought on one end, as, for example, if the muzzles of a rowing piece containing a column of air is plugged up with a cork, or with snow or mud, the barrel may be burst when the weapon is fired, simply because, while the pressure at the muzzle is yet too small to move the cork, the pressure at the breech end is great enough to burst the barrel; or, in other words, the force of compression will not reach the muzzle until the breech has been burst. In the same way the detonation of a lump of dynamite on a rail will break it, the action being so sudden that the wave of transmission of pressure has not time to pass through the air surrounding dynamite, and the air really plays almost the same part as a block of steel round the explosive.

THE EARTH'S CLOUD BELTS.—We learn from the researches of M. Teisserenc de Bort that there is a marked tendency of the earth's cloudiness throughout the year to arrange itself in belts parallel to the equator. A belt of maximum cloudiness may be traced near the equator, two bands of light cloudiness extending from 15 to 35 degrees of latitude north and south, and two zones of greater cloudiness between 45 and 60 degrees, beyond which the sky seems to become clearer toward the poles. These zones have a noticeable tendency to follow the sun in its change of declination, moving northward in spring and southward in autumn. The zones of clear sky correspond with regions of high pressure. The distribution of cloudiness, according to M. de Bort, is a direct consequence of the course of the wind.

DANGER IN DUST.—Whoever thinks of dust as anything more than an inconvenience? Of what is dust made up? Think of this a moment, and its very complex and dangerous character will become apparent. Here are a few of the components of dust: Fine earth, fragments of wood, cotton, wool, feathers and almost everything under the sun. Dried excrement, spittle, filth from the gutter and every possible kind of offensive matter. Dr. Mackenzie, of London, has observed that there is much more sickness in dusty weather than at other times. Sore throats, catarrhs, colds, sore eyes and numerous other maladies abound during dusty weather. House dust is simply street dust brought indoors by the wind, or adhering to unclean boots and shoes.

A SIGNIFICANT FACT.—It is a significant achievement of science when a physician can be taken into consultation at a distance of 6000 miles. This was done recently by means of the telegraph and cable between Victoria, B. C., and London. The annihilation of time and space has rarely been more strikingly shown, and if the patient should recover the incident would deserve an honorable place in medical annals.

USEFUL INFORMATION.

Effect of Time on Slaked Lime.

Led by the statement that the keeping of the lime in a slaked condition for a couple of years is a great advantage to it, I took, says M. Faraday, specimens from the stores which have been so long laid up at the Houses of Parliament for the purpose of examining them in this respect. It appears to me that this lime (which is in a state of paste) is in a very soft and smooth condition in comparison with what would probably be the condition of the lime recently slaked, a condition which seems to be due to its thorough disintegration as a mass, and its separation, particle from particle. On analyzing it I found that it contained a little carbonic acid, but not much, for in 100 parts of the dry substance there were but 51 parts of carbonic acid; these 100 parts, therefore, would contain 88 parts of quick or uncarbonated lime and 12 parts of carbonated lime, which, considering the process of burning, carrying, slaking, etc., that it had to go through, and the necessary time of exposure to air before it was laid up in store, is a very small proportion. I do not believe that the lime which is more than four inches in from the exterior has received any portion of carbonic acid during the two years of its inhumation. In respect to the effect of keeping lime for a time, I am led to think, without, however, having formed any strong opinion on the subject, that the benefit is due to the fine texture that it gradually acquires, and as there is no doubt that if two surfaces were prepared, the one with fine sand and lime in particles comparatively coarse and the other with the same kind of sand and lime in particles comparatively far more perfectly divided, these two would act very differently both as to the access of carbonic acid from the atmosphere and the transition of lime dissolved in the moisture of the mass from the interior toward the surface, so there is reason to expect there would be a difference in the degree of action upon the colors at that surface, and also in the time at which that action would come to a close.

SILVERING IRON.—A manufacturer in Vienna employs the following process of silvering iron: He first covers the iron with mercury, and silver by the galvanic process. By heating to 300° C., the mercury evaporates and the silver layer is fixed. Ironware is first heated with diluted hydrochloric acid, and then dipped in a solution of nitrate of mercury, being at the same time in communication with the zinc pole of an electric battery, a piece of gas carbon or platinum being used as an anode for the other pole. The metal is soon covered with a layer of quicksilver, is then taken out and well washed and silvered in a silver solution. To save silver, the wire can be first covered with a layer of tin; one part of cream of tartar is dissolved in eight parts of boiling water, and one or more tin anodes are joined with the carbon pole of a Bunsen element. The zinc pole communicates with a well-cleaned piece of copper, and the battery is made to act till enough tin has deposited on the copper, when this is taken out and the ironware put in its place. The wire thus covered with tin chemically pure and silvered is much cheaper than any other silvered metals.

AN INGENUOUS RAILWAY APPLIANCE.—It will soon be just as safe to travel on a railroad train as to remain quietly and comfortably at home. It is a shrewd and inventive native of Australia who proposes to bring this longed-for blessing about. He has designed a truck which is to be run at any desired distance before every train. The motive-power is to be furnished by a dynamo placed upon the engine. If the truck should come into collision with anything on the track, certain glass tubes in which the electric current is conducted are broken, and at the same moment the brakes on the train are automatically applied and the cars brought to a quick standstill. Those who have seen the working model say the invention is a great success; but even if it be a failure it furnishes absolute evidence that the inventive geniuses of the world are now at work upon the problem of how to make high-speed travel absolutely secure.—*N. Y. Graphic.*

THE GAME OF MARBLES IN ENGLAND.—Marbles, which once boasted as many games as there are days in the year, are now fallen upon evil times. Knuckling down is clean forgotten—if the art continues, it is called by another name; the alley law is confounded with his brother of the rank and file; there are no longer sold the finer varieties in stone and glass, or in colored and streaky marble, nor do boys, like sportsmen, yearn for a full bag; nor do they study any longer the intricacies, the possibilities and the subtleties by which their bag may be filled. The game is now only played by little boys—their bag is small; their game is simple, and whenever they can raise a penny, the marbles become a vehicle for gambling.—*Saturday Review.*

THE MILITARY DRILL FOR LADIES.—The military drill has been introduced in the Middle Georgia Military and Agricultural College for the physical development of the female students. The young ladies have been formed into a company and are taught military movements. They recently marched to the Methodist church to attend the service, occupying

seats in one corner, while the young men, who also marched thither, occupied seats in the opposite corner.

TREE GROWTH.—George M. Woodruff of Litchfield, Conn., who carved his initials 35 years ago on the limb of an apple tree, found the souvenir the other day just as a piece of the tree was going into the fire. Mr. Woodruff has often looked for the initials "G. M. W.," but they had disappeared from the surface. A short time ago the tree was cut down, and the letters, as found, must have been about four inches from the surface.

CAMEL'S HAIR BELTING.—Recent experiments at the Royal Polytechnic School at Munich show that belting made of camel's hair has a strength of 6315 pounds per square inch, while that of ordinary belting will not stand a strain of 2230 to 5260. The camel's hair belt is said not to be affected by acids, and works exceedingly smooth and well.

DREDGING THE THAMES.—The tedious work of removing bowlders and the remnants of an ancient forest from the bed of the Thames river still goes on. It began seven years ago. At last accounts 300 trees and 1300 bowlders had been taken out. The latter varied in weight from one to four tons.

VEGETABLE GROWTH ON A TELEGRAPH WIRE. A telegraph wire is the last thing one would expect to support vegetation, yet a traveler in Brazil writes to a German horticultural journal describing a crop of mistletoe which he found clothing the wires not far from Rio Janeiro.

ETCHING MIXTURE.—A mixture that will etch deeply or give a beautiful frosted appearance to metal is prepared in the following manner: Sulphate of copper, one ounce; alum, one-fourth ounce; powdered salt, half a teaspoonful; vinegar, one gill; nitric acid, 20 drops.

SUNFLOWERS are used in Wyoming Territory for fuel. The stalks, when dry, are as hard as maple-wood, and make a hot fire, and the seed-heads with the seed in are said to burn hotter than the best hard coal. An acre of sunflowers will furnish fuel for one stove for a year.

A BABEL OF LANGUAGES.—The Bible has to be printed in 29 different languages to supply the people living in Pennsylvania. The largely varied industries of Pennsylvania attract to that State a much more cosmopolitan population than any other State in the Union.

ABOUT 30,000 cords of hickwood has been manufactured into spools at Foxcroft, Me., the past few years.

GOOD HEALTH.

The True Cause of Baldness.

How it May be Avoided.

The habit of wearing warm coverings on the head is not of recent date; the armies of Europe, for instance, no inconsiderable number of men, with heads close cropped, have worn for a long period warmer and heavier head-gear than the modern dwellers in cities, without the same tendency to baldness. Nor are the heavy fur coverings of northern races incompatible with luxuriant hair. It is also difficult to understand what injury can result from close cutting, *per se*. The growth is in the hair-follicle, and in it alone; there is no vital connection between the hair outside the scalp and within; it is usually cut closest at the back of the head and neck where baldness never occurs. Would not close cutting rather stimulate the growth by exposure of the scalp? Such at least is the popular belief. So, too, with indoor life; women, who ought to show it most, whether in the home or in the factory, are never bald as men are; on the contrary, it is most common with men in good circumstances, men who spend a larger proportion of their daytime in the open air than the indoor worker.

I believe the common form of baldness is due entirely to the kind of hat that is worn, principally to the high hat and the hard felt hat, but also to any other head-covering that constricts the blood-vessels which nourish the hair bulbs. To have a clearer understanding of this, we must remember that the scalp is supplied with blood by arteries at the back, sides, and front of, and lying close to the skull, which diminish in size by frequent branching as they converge toward the top of the head. They are in a most favorable position to be compressed, lying on unyielding bone and covered by thin tissue. Consider what effect must be produced by a close-fitting, heavy, and rigid hat; its pressure must lessen to a certain extent the flow of arterial blood, and obstruct to a greater extent the return of the venous; the result being a sluggish circulation in the capillaries around the hair follicles and bulbs, a consequent impairment of nutrition and final atrophy. This pressure is not trivial or imaginary, as any one will admit who has noticed the red band of congestion on the forehead when a hard hat is removed after moderate exercise.—*W. C. Gouin-lock.*

PUBLIC HEALTH—NATIONAL LEGISLATION.—An important bill was introduced into the Senate at Washington on the 4th instant by Senator Gibson for the establishment in the Interior Department of a bureau of health, to be

under the direction of a commissioner, who shall receive an annual salary of \$5000. The bill also provides for the appointment by the President of a health commission, to be composed of 20 members, who shall be divided into six sections, as follows: Five for the yellow-fever section, and three each for the cholera, typhoid fever, scarlet fever, smallpox and diphtheria sections. Each member shall receive an annual salary of \$1200, and it shall be their duty to investigate the cause, origin and best mode of prevention of the diseases mentioned. Five members of the commission shall be organized into a quarantine commission, whose duty it shall be to examine into and report on the efficiency of quarantines at the various seaports of the United States. Upon the report of the commission to the Health Commissioner, if the quarantine service at any point is ineffectual, the commissioner is commanded to direct the Collector of Customs at the port to refuse entry to any vessel, goods or persons coming from any infected place unless the vessel shall have undergone quarantine at some national quarantine station. The Health Commissioner is directed whenever called on by a Governor of a State to make rules and regulations and take measures for the suppression of any infectious disease. It is made the duty of the consular office to make weekly reports to the Health Commissioner in regard to the sanitary condition of foreign ports. It is made unlawful for any person to obstruct commerce between the States or with any foreign country except in accordance with the rules prescribed by the Health Commissioner.

NURSING OUR ACHES AND PAINS.—Some who are always sick seldom think that they have it in their own power to do for themselves that which no other one can do for them, but are always presenting their cases to all who meet them, with comments and suggestions, until their auditors are weary. Daily and almost hourly these feelings are talked over without the least alleviation, until both sick and well become discouraged as to any favorable result. If such would only become acquainted with the principles of mental hygiene, and act accordingly, how much suffering to self and friends might be saved. Human nature is generally prone to extremes, and by these conditions diseases of various kinds and grades are induced, and with impatience to regain health and still retain old habits, physicians and friends are expected to contribute to the demands of the patient while they themselves act as an independent party. No greater mistake could be made. There must be co-operation of both patient and attendants to insure success. Patients who constantly worry about themselves and study every ache and pain, very seldom make rapid recovery.

WHY WOMEN SWIM WELL.—Their precious bones are lighter and their flesh is more buoyant. The records of the humane societies on both sides of the Atlantic show that of late years a fair proportion of their medals fall to the lot of girls. There were several notable instances of rescue from drowning last summer by girls under 20 years of age. Many women are accomplished swimmers. This is not natural. As their bones are generally lighter than those of men, and their flesh more buoyant, they have less difficulty to overcome in acquiring the art. Some of them could float at their first attempt if they could acquire the requisite faith in the power of the water to hold them up. Swimming is very much an act of faith, for it is generally the case that when a person believes sufficiently in the buoyancy of the water to trust it to his precious body, lo! he is a swimmer. There were young girls at Newport last summer who could float on the surface of the ocean with no more difficulty than they experienced in lying upon a sofa. They could have floated for hours if necessary. Some of the most famous swimming feats have been accomplished by very young women.—*Philadelphia Record.*

EFFECT OF CLIMATE AND CHANCE OF LOCATION ON LONGEVITY.—The Philadelphia Medical News prints an important address delivered before the American Climatological Association at its late meeting, by Dr. Loomis of New York City, dealing with the novel question of the climate and environments best suited to people who have passed the prime of life. The author shows that old age thrives best in moderately warm climates, and that a change of residence once or twice a year is a necessity, while the locality selected must invite an outdoor life, with surroundings which stimulate to mental and physical activity. He emphasizes the importance for persons of advanced age of an abundance and variety of simple, nutritious and well-cooked food, the avoidance of the exhaustive business habits and excitement of earlier life, and the utility of warm alkaline baths.

INTERESTING STATISTICS.—According to the following statistics, France must be peculiarly blessed with a healthy climate. The number of persons in each 1000 between the ages of 50 and 60 are: France, 5373; Holland, 4984; Sweden, 4954; Great Britain, 4722; United States, 4398. The highest average ages of the living are: France, 31.06; Holland, 27.76; Sweden, 27.66; Great Britain, 26.05; United States, 23.04. Out of every 100 deaths those persons over 60 are: France, 36; Switzerland, 34; England, 30; Belgium, 26; Prussia, 19; Austria, 17. France has the lowest birth rate, which is 23.8 to 1000, Great Britain 31, Germany 38.

Technical Training in Public Schools.

On Thursday, Nov. 23, a paper was read before the Polytechnic Section of the American Institute "On the Value of Technical Training and the Teaching of Drawing and Handwork in Public Schools," by Edward Combes, C. E. C. M. G., Officer of the Legion of Honor and president of the Board of Technical Education of New South Wales.

The following is an abstract of the paper: The subject has occupied the attention of great statesmen and eminent educationalists. Nearly every Government in the civilized world has instituted inquiries concerning it. All of these resulted in recommending the organization of a system of technical education. The old system of apprenticeship having broken down, it becomes the duty of the State to devise other means of teaching the various handicrafts.

Drawing the foundation of all technical teaching, and should be taught in every primary school. Its importance in an industrial education. The study of drawing directly valuable as an educating and humanizing influence, training the mind to be observant, judicious and active. Drawing connects the culture of good taste with culture in morals, especially developing industry, order, decency and purity.

Description of Herr Jessen's method of teaching drawing, the distinguishing figure being individual personal instruction, as opposed to the ordinary system of teaching in class. Great success of his method and general adoption.

The question as to the best method of teaching in technical schools. Importance daily becoming more significant. Public opinion more and more prevalent that radical modifications must be made in primary schools.

The impossibility of making all our young men parsons and clerks, consequently something should be taught adapted to the manufacturing requirements of the country.

Manual training or handwork should be compulsorily taught in every primary school. Children must be taught to use their hands as well as their heads.

The Swedish system of teaching handwork called the *slöjd*. Its success. Normal school for teachers of the system, instituted and endowed by Herr Ahramson.

Opportunities and facilities for the acquisition of technical knowledge greater in France than in any other part of the civilized world.

Political aspect. Cost of technical education repaid to the State by the extra quantity and quality of the work.

MT. RAYMOND MINING DISTRICT.—At this district in Fresno county the Star Mining and Reduction Company are pushing work on their concentrating plant as fast as men and means can do it. They have purchased one of A. S. Hallidie's elevated wire ropeways to carry their ore from the mine to the mill, a distance of 1½ miles, which is now almost erected. They will have their whole reduction plant in operation about December 15th, when they will commence the shipment of concentrates at the rate of 25 tons per day. The concentrates will net \$100 per ton in gold, silver and lead. There are no other companies operating in the same district as yet, as the ores are hard and require expensive plants for profitable treatment.

SACCHARINE seems now to be extensively used as a substitute for sugar in syrups and preserves, and even in champagne. This last is a fact fully recognized in commerce. Even as a medicine, saccharine is not harmless. M. Worms says that diabetic patients who use it for a fortnight lose their appetites. M. Dujardin Beaumetz thinks, however, that as a therapeutic agent saccharine is useful in the case of the few diabetics who cannot do without sugar. The *Gazette des Sciences Medicales* thinks there can be no doubt as to the propriety of preventing its general use.

TOO MUCH WATER.—The famous Perahacker mine, Magalia, shut down the other day on account of a rush of water into the tunnel. An improved engine was at work keeping the water out, when the flume that supplied the engine with water fell some distance above the mine. This caused the engine to stop, and the engineer hastened to fix up the flume. But when he returned the pump in the tunnel were covered, and we are told that new pumps and many thousand dollars extra expense will be required to put the mine in the condition reached when the flume fell.—*Oroville Mercury.*

MELROSE, an outgrowth of Alameda on the east, is rapidly coming into prominence as a manufacturing center. Within its boundaries are Whittier, Fuller & Co.'s smelting works, now running night and day and turning out on an average 300 tons of white lead a month; the new fuse works, which are also running full blast, and also the factory of bisulphide, a poison for the extermination of squirrels. Machinery for the manufacture of mineral paint is now being placed in position, and this industry will be in operation before the end of the year.

A FULL-GROWN hawk and two does have been feeding for some weeks with the cattle of Albert Rosa at Long Valley, Lassen county. Mr. Ross does not disturb them, and he hopes the graceful animals will stay and get tamed.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

COAL NOTES.—Livermore *Herald*, Dec. 7: Work has been begun in the Pen Daren incline. Thirteen shifts of miners are sinking, and will sink to a depth of 500 feet. At the Richards vein the company will sink a double-compartment shaft at once, and will work both the Eureka and Richards vein through this shaft, prospecting so far done assuring an immense deposit of good coal. The present incline will then be used for an air-shaft. It is the intention of the company to open its mines as they should be opened, and they have ample means to do so, and they are spending their money so as to be able to ship 250 tons of coal a day, within four or six months from date, by which time the Livermore Valley Railroad Co. will have their road to the mine completed. The mine is in charge of Jenkin Richards, one of the most experienced coal miners on the coast, he having particular knowledge of this field, having nearly done all the prospecting in this locality.

Amador.

PACIFIC.—*Dispatch*, Dec. 8: At 1 A. M. Thursday week, one of the large water-tanks used in hoisting water at this mine caught in a piece of broken tract and damaged the tank to such an extent that it cannot longer be used. A wooden bucket has been provided in its stead, and they are now hoisting night and day with the tank and bucket. It is expected that the mine will be dry about the middle of February.

CASCO NO. 2.—The assessment work is being done on this mine, located between the old Hardenberg and the Truckee Lumber Co.'s claim in Hunt's gulch. A tunnel is being run into the hill south, on the ledge, and the indications are flattering for a good mine.

CUPPS' MINE.—Operations on this property, located about half a mile east of the New London, have ceased. No cause is given for the shut-down. The superintendent, Mr. John Cupps, is in S. F., and writes that the suspension of work is only temporary.

COSMOPOLITAN.—At this mine, near Drytown, they are in with their crosscut about 70 feet to the east, and have cut through several nice stringers of quartz. They expect to strike the main ledge soon.

NORTH CALIFORNIA.—A three-foot ledge of good milling ore has been struck in the west crosscut of this mine, about 80 feet below the surface.

PLYMOUTH.—*Amador Ledger*, Dec. 8: The Plymouth Consolidated is running two shifts in taking out water, and work of drainage is making satisfactory headway. In another month at the outside, the works ought to be free of water.

NORTH STAR.—They are running alongside the rich seam and have advanced the drift over 50 feet, the seam continuing the whole distance. They are not taking it out, although occasionally breaking into it, proving that it still holds out. It is probable that the shaft will be put down another 100 feet, and from that depth a drift will be run to tap this seam, as the general impression is that at the present depth they have simply encountered the apex of an ore-chimney, and that it will be found to widen out at a greater depth.

Butte.

GOLD BRICK.—*Oroville Mercury*, Dec. 7: Superintendent Gregory of the Cherokee mine was down to-day and shipped a \$62,000 gold brick, having made a cleanup of \$68,000, the result of a three months' run. The mine is nearly out of debt locally, and a few more cleanups like this one will put it on a solid basis. The payroll is about \$11,000 a month and it is the best paying institution in Butte county.

FORRESTOWN.—*Oroville Register*, Dec. 7: Three quartz ledges are being worked and employment given to about 100 men in getting out ore and running the mills. The chlorination works are now completed and are quite successful in their reduction of the ore. They are among the largest works of this character on the coast. There are a number of late developments in quartz that promise very rich.

Calaveras.

RESUMING.—*Mountain Echo*, Dec. 5: All the mines throughout the county that have been closed down during the summer for lack of water are resuming operations.

LINDSAY.—Work is progressing steadily in the Lindsay mine near this town.

Fresno.

WHITE CROSS.—*Fresno Examiner*, Dec. 7: The White Cross mine near Dunlap, owned by the Works boys, is yielding some very rich gold-bearing quartz. None of the ore has been assayed lately, as it is free-bearing rock and the gold can be seen all through it with the naked eye, and when anything better than that is wanted they "born-noon" a sample or two. A tunnel 170 feet in length is being run on the ledge, and the rock is being piled up on the dump for future working.

Humboldt.

BEACH MINING.—*Humboldt Times*, Dec. 7: The gold concentrator, which we mentioned some time ago on the south beach, was taken to Coos Bay, and lately returned to this county. It is now at work on the gold-bearing sand on the property of C. E. Beach near the mouth of Little River.

Mariposa.

WINNER.—*Gazette*, Dec. 8: The shaft on the Winner, near the cemetery, is 85 feet deep. Very good prospects have been obtained, and a contract has been let to run a drift along the lode, 100 feet in each direction. Twelve men are at work on the Pine Tree mine. At the depth of 600 feet, where they are now operating, they have uncovered about 200 feet of a vein which averages good assays and has the appearance of permanence. The vein is about six feet in width. They are storing the rock for milling.

HORNITOS.—*Mariposa News*, Dec. 1: J. B. Brown struck a rich pocket this week at the Duncan mine. It is reported that he took out over \$1000.

RED CLOUD.—Red Cloud mine expects to resume work again shortly.

LEAO AND SILVER.—*Sonoma Bayner*, Dec. 7:

Mr. Louis Blanding has just tested a piece of iron ore from a mine in Mariposa county, owned by Mr. R. B. Randall, and finds 57½ per cent of lead and \$257.20 in silver.

Napa.

QUICKSILVER SHIPMENTS.—*Calistogan*, Dec. 5: During the month of November the following amount of quicksilver from the mines mentioned was shipped from Calistoga: Napa Consolidated, 475 flasks; Sulphur Bank, 256; Bradford's, 218; Great Western, 28; total for month, 977 flasks.

Nevada.

SOLD.—*Grass Valley Union*, Dec. 7: It is rumored that a controlling interest in the old Gold Hill mine has been sold. A vein of fine ore has been opened up in the North Banner mine above the level of the lower drain tunnel. It is three feet in size. The vein in the winze 30 feet below the floor of the tunnel is showing of equal size. There is now a force of 25 men employed at the mine. The new mill is about ready to start up, the only occasion for delay being to have all the machinery in smooth working order to commence regular crushing. All the machinery of the mine and mill works will be run by water-power. The work on the new mill of the Pittsburg mine is being pushed as fast as possible to get ahead of winter weather. If the storms keep off the works will be inclosed in the next two weeks, when the placing of the machinery can proceed without interruption. A force of workmen is now engaged in putting the surface plant of the Coe mine in condition to start the underground work. About two weeks' time will be required to place everything in order.

PUTTING IN THE FRUE.—*Grass Valley Union*, Dec. 9: Mr. James Brownell, representing the firm of Adams & Carter of San Francisco, has been busily engaged putting in four Frue concentrators at the North Star mill, these concentrators to do the work from the additional ten stamps being placed in the mill. The North Star is well stocked with the Triumph concentrators, but they are going to give the Frue a thorough test.

Placer.

THE HIDDEN TREASURE.—*Placer Herald*, Dec. 7: This mine still continues to yield handsome dividends to its fortunate owners. The tunnel is now about 8000 feet in length, and on a uniform grade of 70 feet to the mile. Sometimes the grade carries the tunnel several feet into the bedrock and sometimes along its surface. The work is still done on the eastern side. Gangways are run off every 200 feet, and these are connected at the back end by crosscuts. The blocks thus formed have an area of 20,000 square feet. These gangways and crosscuts give a good circulation to the mine. The bedrock at the upper end of the tunnel is principally black slate which glistens like coal in the candle-light. Now and then this black slate is displaced by white. Occasionally a petrified tree trunk is found in the white quartz gravel. In addition to the improvements that were made in the tunnel last year the company put in nearly 1400 feet of sluices. These sluices are paved with wooden blocks, boulders and broken car wheels. The latter make splendid riffles. At the end of the first set of sluices is an under-current, 36 feet in length by 12 in width. This under-current is so made that it can be raised or lowered according to the head of water. This is a new feature and works very satisfactorily. Some 150 men are employed in the mine. The work goes on night and day, and every carload of gravel is prospected before it is rolled out of the tunnel. The getting out of lagging and timbers employs quite a number of men. E. Woodridge has charge of this work under contract. The mine is worked systematically, and is under the efficient management of Harold T. Power. Quite a town has grown up around the mine, on the El Dorado Canyon slope.

AT OPHIR.—*Placer Argus*, Dec. 7: Work is progressing at the Hathway mine at Ophir. Four men are at work cleaning out the tunnel, and six men are busy on the mill. They have erected a mill 36x64 and the hoisting works 20x40. The quartz will be raised by two friction drums on an eccentric shaft, the power to be furnished by a four-foot six-inch Knight wheel. The mill is a ten-stamp Knight and will be run by a six-foot Pelton wheel. The rock-crusher will be run by a 24-inch Pelton. Iron pipes will be laid from the reservoir and will give a fall of 230 feet in a straight line. Everything will be ready to start about Jan. 1st. There is considerable good rock in sight, and extra precaution will be taken to save all the gold, as there are 110 square feet of copper plates, almost as much as is usually used on a 20-stamp mill.

DARDANELLES.—*Placer Herald*, Dec. 7: Work in the Dardanelles has been delayed by water. Some underground reservoir has been tapped and has discharged a 20-inch stream for the last ten days. Some of the men have been laid off temporarily until the water is got under control, as there is not room for them all to work. The mill has not been run steadily for the reason that there has not been a sufficient quantity of gravel taken out, since the water trouble began, to feed it. The gravel is as rich as ever.

FOREST HILL.—J. C. Scott of Forest Hill made the *Herald* a social call this week. Mr. Scott owns in several claims in the vicinity of Forest Hill, and has been cleaning out and retimbering the tunnel on his Volcano Canyon claim. This tunnel is 625 feet in length. Mr. Scott has started an upraise about 600 feet back from the mouth of the tunnel, but has stopped work for a time on account of bad air.

San Diego.

THE OIL WELL.—*San Diego Sun*, Dec. 3: Boring for oil in Sweetwater valley was resumed this morning, a week later than had been intended by the soliciting committee who raised the money. It is believed that but a few hundred feet farther than the depth of 700 feet already attained will uncover the cheap fuel supply that experts say underlies the soil.

Shasta.

NOTES.—*Shasta Democrat*, Dec. 5: Tom Cummings, the old resident, we are told, is on the head of the McCloud river prospecting for silver. Five stamps on the Frank Wheeler mill at French gulch started up last week, and with more rain the mill and mine will be worked with full force. The Calumet M. Co.'s mill is now running night and day. They are piling up sulphurets by the ton, which they expect to work on the ground as soon as their furnaces are ready. There are about 20 applications for patents on quartz mines in this county

now going through the usual legal formula through the Shasta land office. This is in itself a good showing for the mining interests of this county. The Gladstone M. Co. of French gulch is putting in one of the Paul 12-stamp batteries. They will use water for power, and seeing the completeness of the Knight wheel at the Calumet mill, have ordered a duplicate of it for their mine. The Gladstone is one of the big mines of Shasta county and is owned by Thos. Cummings, Charles Osborne and John Morrell. O. P. Woodward of Whiskeytown believes a rich mining camp will be developed on Whiskey creek before many winters pass by. He is an old resident of Whiskeytown and knows the country surrounding that old placer camp thoroughly. The hidden sources that feed the rich placer grounds in that region can be found by close and diligent prospecting, and some good prospecting will be done there this winter. John Border & Son are developing a fine prospect on Whiskey creek, about a mile east of Whiskeytown, that promises to be a good mine. The vein is about three feet wide, well defined, and the ore they are now taking out is high grade. In close proximity George Knox has struck a rich chute of ore in the old Emigrant mine. The chute is between 50 and 100 feet long, and is cut at a depth of about 100 feet. George thinks the ore he has taken out lately will average \$50 to the ton. He is fixing up an arastra, which he will start up as soon as sufficient water-power can be obtained.

SOLO.—*Courier*, Dec. 8: John Winters, who has been one of the main men in charge of the batteries at Lost Confidence mine, Iron Mountain, for some time, has sold a mine on the Mountain, between the Lost Confidence and the daisy Little Nellie mine, to Isadore Krauss for a consideration said to be \$4000.

POCKET.—Knox, Crocker & Gerry have struck what has the appearance of a pocket bonanza near Rock creek, two miles or so north of town—a six-inch ledge of chrome and quartz conglomerate between porphyry walls smooth as polished marble.

Sierra.

THE RAINBOW.—*Tribune*, Dec. 7: At the Rainbow mine, Chips Flat, work is to be resumed in the tunnel as soon as enough water comes to run the machinery. The tunnel is in 2000 feet on a newly discovered ledge.

Siskiyou.

PLACERS.—*Yreka Journal*, Dec. 8: The Breceda Bros. are opening a placer claim at the mouth of Deadwood creek, in preparation for the rainy season, and expect to do well as soon as plenty of water is furnished during the winter storms. On the South Fork of Scott river the miners on the various tributaries are expecting to put in some good work at mining until the snow gets too deep or the storms too heavy to confine their operations to cabin life. The river miners on the Klamath still continue to take out pay gravel, but expect to be obliged to suspend most any time now, when a heavy storm or heavy frost occurs.

Trinity.

LONG RIDGE.—*Trinity Journal*, Dec. 8: Mr. Crowl brought in some specimens of coal from Poison Camp. A vein 10 feet thick is exposed in a washout. Poison Camp is in this county, about 12 miles from Hettenshaw. Coal has also been found on Bluff creek, about seven miles from Poison Camp. These discoveries will undoubtedly incite a more thorough prospecting of that neighborhood.

COX BAR.—C. J. Johnson of Cox Bar says that the miners in his vicinity are ready for their winter's work. He says that the prospects of the Vance Bar mine, of which he is owner, are very encouraging. While in town he made arrangements for more pipe and material to work the mine on a larger scale another season.

NEVADA.

Washos District.

HALE AND NORCROSS.—*Virginia Enterprise*, Dec. 7: During the past week 934 tons of ore have been hoisted and 767 tons have been sent to the Mexican mill. The average battery assays have been \$30.25 per ton. On the 500 level are stopping ore of good quality from the body recently discovered in the main west drift. On the 600 level have started a drift west to find the downward extension of the 500 level ore body. The stopes on this level continue to show considerable fair-grade ore. On account of the scarcity of water in the Carson river, the Mexican mill has been unable to work the full shipments of ore. The bullion on hand amounts to \$12,000.

SAVAGE.—On the 400 level the southeast drift has been advanced 25 feet in porphyry and clay. The northeast drift was advanced 24 feet. The face is in quartz which gives low assays. During the week have hoisted 597 tons of ore and have shipped to the Rock Point 490 tons, the average battery assays of which are \$18.01 per ton. Have shipped bullion amounting to \$940.67, and have bullion at the mill amounting to \$10,479.23.

CONFIDENCE.—The top of the raise from the 1200 still shows ore of good milling grade. During the past week 500 tons of ore assaying \$32.75 a ton have been shipped to the Brunswick mill, Carson river. Have shipped 8 bars of bullion valued at \$22,962.47, being the closing shipment on November account. The total bullion production during that month was valued, by assay, at \$105,689.51.

CON. CAL. VIRGINIA.—The stopes on the 1400 level are yielding the usual amount of good ore. On the 1600 level some ore is being extracted from above the track floor. On the 1650, ore of good quality is being mined at half a dozen different points and a good deal of prospecting is being done. The usual amount of ore is being shipped to the river mills.

YELLOW JACKET.—Running prospecting drifts throughout the mine. The men at work extracting gold ore were laid off on the 28th of November pending the result of a test run of the ore by a concentration process at the Santiago mill. Supt. Sharon went to the Bay night before last, and the result of the test would be known to him yesterday.

CHOLLAR.—The raise from the north drift on the 650 level continues in low-grade quartz. The west drifts on the 750 and 850 levels are still in clay and quartz. The Nevada mill is running 30 stamps (by water-power) on ore from the mine.

CROWN POINT.—The raise from No. 1 crosscut on the 700 level is passing through ore of an excel-

lent quality. Good progress is being made in cutting the drain and grading the Suro tunnel drift. There remain now about 250 feet to finish. Repairs to boilers and to the incline engine-room and boiler-room are about completed.

JUSTICE.—Are still engaged in repairing the north drift. The Alta Co. has commenced a raise to connect with the 490 level north drift and are up 32 feet. Are still stopping milling ore from the south-east winze. The cannon-ball crushers in the mill will be replaced by 10 stamps.

ALPHA.—The 500 level north lateral drift is north of the shaft 192 feet; the face is in clay and quartz. The south lateral drift on the same level is in south of the shaft 95 feet; the face is still in quartz that assays from \$12 to \$20 per ton.

BELCHER.—Good headway is making in the north drift on the 200 level. It is in a favorable mixture of clay and quartz. The joint (Seg. Belcher) drift on the 1100 level is in quartz carrying some metal.

BEST AND BELCHER.—The north drift, 20 feet west of the winze, has been extended 13 feet; total length, 30 feet; formation, porphyry, clay and quartz, showing some value.

GOULD AND CURRY.—On the 200 level the north drift started 100 feet from the top of the upraise has been extended 30 feet; total length, 76 feet; formation, hard porphyry.

CHALLENGE CON.—During the past week 220 tons of ore have been extracted and sent to the Brunswick mill. The average assay of this ore is \$32.95 a ton.

ANDES.—Have repaired stations No. 1 and No. 3, and are now repairing station No. 2. Are doing the usual work on the 350 and 240 levels.

SCORPION.—On the 300 level the west crosscut has been advanced 15 feet during the week; the total length is 315 feet.

UNION CON. AND MEXICAN.—The joint north-east drift has penetrated Mexican ground 198 feet.

SIERRA NEVADA.—The two crosscuts on the 520 level are in a mixture of quartz and porphyry.

SEG. BELCHER.—The joint Belcher drift on the 1100 level is in quartz carrying some metal.

OPHIR.—The south drift on the 1465 level is in porphyry, showing numerous seams of clay.

CON. IMPERIAL.—The repair work on the 1100 level is still in progress.

POTOSI.—The 650 level south drift is still showing clay and porphyry.

ALTA.—Good progress is making in the changes to the mill.

BULLION.—Hoisting works again running.

Tuscarora District.

DIANA.—*Times-Review*, Dec. 7: The crosscut being run east on the 300-foot level has been advanced 12 feet.

NEVADA QUEEN.—No. 2 east crosscut from west gangway, 200-foot level, has been advanced 14 feet. Line crosscut on 225-foot level of Commonwealth has been extended east 6 feet, and west 8 feet; the rock continues hard. On the 100-foot level Commonwealth, the joint crosscut is showing six inches of very high-grade ore. No. 1 winze, from 350-foot level station, has been cut out and timbered, and started sinking. Bottom is in ore, 14 inches of which is good grade. North drift, 450-foot level, has been extended 10 feet, encountering more water and much softer rock. Work at the concentrator is being pushed; expect to have all running in a day or two.

NAVAJO.—150-foot level: The upraise on the west vein, opposite the shaft, has been extended upward 12 feet, and has materially improved, looking well in the top. Crosscut from same vein has been extended 8 feet. 350-foot level: Crosscut from west vein has been extended 18 feet. South drift from No. 4 crosscut has been advanced 13 feet. The stopes are yielding a full supply of high-grade ore for the mill. Mill is running nicely and doing good work—shipped Monday, December 3d, \$16,978.16.

COMMONWEALTH.—100-foot level: No. 1 winze from east lateral has been sunk 11 feet, and connection made with east lateral on 150-foot level. North drift from joint west crosscut has been extended 10 feet, and intersected with east crosscut. Intermediate drift from top of No. 4 chute has been extended 10 feet in vein material, showing some good ore.

GRAND PRIZE.—The 400-foot level station is now clear of water, and the work of laying track, etc., will be begun immediately. The 300-foot level winze station is being fixed, and sinking will be resumed to-morrow.

COMBINATION SHAFT.—Work on the new hoist is progressing favorably. The building is inclosed, and machinery being put in place as fast as possible.

FOUND TREASURE.—The surface cuts have been completed. The timbers in east drift, 200-foot level, have been eased, and the drift put in good order.

NORTH BELLE ISLE.—West crosscut, 400-foot level, has been advanced 14 feet. Rock continues about the same as last reported.

BELLE ISLE.—East crosscut from north drift has been extended 7½ feet; the rock continues very hard.

Eureka District.

THE DIAMOND TUNNEL.—*Sentinel*, Dec. 7: The contractor in the new Diamond tunnel has completed the grading for the blacksmith shop, and two days ago was about entering the mountain with the face of the tunnel proper. He has received about all of his winter supplies, and in a few more days will be under cover. He has a crew of six of the best miners to be found in the district and will push the work day and night until it is completed. A blast in the face of the tunnel on Thursday disclosed a two-inch stringer of fair-looking galena ore. This is not important except as an indication that the limestone belt at that point is strongly mineralized all the way down to the shale contact. The tunnel starts in on the upper edge of the shale, a little of it showing on the lower side of the cut of the tunnel. It is the opinion of judges that the new tunnel is quite apt to cut important feeders to the main ore body within a distance of 150 feet. The small stringer met within the face on Thursday last adds strength to this opinion.

Flowsy District.

TRIBUTERS.—*Virginia Enterprise*, Dec. 7: In Flowsy district tributaries are obtaining small lots of

good ore from the North Bonanza, Lady Bryan and half a dozen other mines. The Bossell mill is running on sulphurets from blanket slices. W. Rowe, the present owner of the mill, has fitted up the dwelling adjacent and will make it his home for the future. A good milling head of water is now roaring and dashing and splashing down through the rocky channel of the canyon.

Philadelphia District.

PURCHASED.—Belmont *Courier*, Dec. 8. J. E. Severance is the owner of all the mining property, including the hoisting works, machinery, etc., situated in Philadelphia Mining District, formerly owned by the Belmont Mining Company. Mr. Severance also owns a half interest in the Monitor Belmont mill, the last payment having been made last week. Lessee J. E. Severance shipped this week 11,418 ounces of silver bullion (in ten bars) 900 fine. The Monitor Belmont mill is running constantly on ore from the Barcelona mine. This mine continues to yield rich ore in good quantities.

ARIZONA.

CLIFTON.—*Clarion*, Dec. 7: We have often been asked of late our opinion as to the mining future of Clifton. To this we can only give our humble opinion that as a copper camp it is bound to be a howling success for years to come. As a producer of the precious metals, time and development can only answer. This much, however, we can with truth say: That while there may be as good, there are certainly no better indications in the Territory of the wealth and permanency of ledges than are found in this neighborhood; and we do not know of any section which can show so many. It must be remembered that it is only within the past year that attention has been called to this district as a producer of gold and silver, and it has made a most excellent showing in that time. No real depth has been attained so far to test the permanency of ledges, but of those on which work has been done none have yet "petered out." The future of Clifton is certainly very bright from the present standpoint.

WATERVILLE.—*Tombstone Epitaph*, Dec. 7: But very little has been done on this property since last week. Aside from the fact that the machinery was delayed in transit, the rains have left the roads almost impassable, so that the completion of the works are set back about 30 days.

GROUND HOG.—H. T. Fisher, superintendent of the Ground Hog and Vizina mines, returned from the East this week, where he purchased a diamond drill, and will start prospecting the Vizina. Mr. Fisher also completed arrangements for the erection of a ten-stamp mill, and work will be commenced in a few days. The mill will be erected near Tombstone.

LUCKY CUSS.—Work on the 400 north is being pushed ahead as fast as possible to connect with the 300 winze. The south drift on the 300 is in over 300 feet. The winze between this level and 400 yields fine ore.

EMERALD.—The Rand drills are at present at work on the south drift on the 300, but one will be placed on the 400 in a few days.

HURSCHEL.—The drift is in 81 feet all in good ore. The winze is down 18 feet. Stopping has been commenced and shipments will be made regularly.

BRITISH COLUMBIA.

ORE SHIPMENT.—*Donald Truth*, Dec. 5: This week 50 tons of ore were shipped from the Monarch mine at Field to the smelter at Vancouver. The ore carries about \$25 to the ton in silver and a large percentage of lead. The value of the lead and silver combined will approximate \$5000. From this on the Monarch will make regular ore shipments. The company is building a shed over the upper tramway so as to prevent a stoppage of work on account of snow. Some 30 men are employed altogether, and work is carried on in the mine by a night and a day shift.

JUBILEE MOUNTAIN DISTRICT.—Charles F. Law, who has been absent in Ontario for some time trying to raise money to develop the Law & McIntyre claims on Jubilee mountain, has succeeded. He has raised \$8000, which is to be expended on development work during 1889. As soon as the necessary papers are signed, work will be commenced and prosecuted vigorously on the Atlanta claim. Jones & Wells on their side of the mountain have built a good wagon-road from their claims to the steamboat landing, a distance of six miles, and will at once put eight men to work taking out ore from their great Spilmichene mine. The ore will be taken from the croppings, which are over 125 feet in width, and hauled to the landing for shipment when navigation opens in the spring. This mine will undoubtedly prove one of the big ones of British Columbia. It is an immense ledge of low-grade galena, that carries \$12 in silver and from a trace to \$3 in gold to the ton.

COLORADO.

COAL.—*Elk Mountain Pilot*, Dec. 6: The coal trade from Crested Butte is gradually on the increase. All of the new coal cars the Rio Grande has built within the last year have been 20-ton cars instead of the regular 10-ton narrow-gauge cars, so while the number of cars may not have materially increased the tonnage has practically doubled. The C. & I. Co. have orders for all of their coke output, but for some reason the mine does not run on regular full time for coal shipments. The anthracite mine and breaker is now running regular and expects to do so all winter notwithstanding rumors to the contrary. Supt. Haas informs us that they have experienced some difficulty in getting good men to go to work there or stay when they could get a job elsewhere, owing to the report being circulated that the mine is going to shut down soon for the winter, which is absolutely false, and so far as known now the mine will run all winter without stopping. They have orders on hand for over 6000 tons of coal and orders coming in about as fast as they can produce the coal.

NOTES.—*Georgetown Courier*, Dec. 7: The Little Giant is said to be turning out well. Sinking is still under way on the lode cut by the Florence tunnel. Two cars of Stevens ore were milled at the Miners' Works last Saturday. Fillius & Co. have shut down the Stevens concentrating works for the winter. The miners on the Freeland are making a

vigorous kick against working seven days a week. The Hall tunnel is going ahead about five feet a day. During the month of November 58 cars of ore, containing 690 tons, were shipped from Georgetown. Denver received 40 and Argo 18. Between four and five tons of ore from the Commonwealth were milled last Saturday that returned 68 ozs, silver per ton and 61 per cent lead. The purchaser of the Orient leased and bonded the mine a couple of months ago and took out enough ore to pay for it. There's tenderfoot luck for you. Works are to be built in Denver to utilize the asphaltum found on the dividing line between Colorado and Utah, where it is said to be found in almost unlimited quantity. The shaft on the Blatter lode has been sunk 50 feet, and the bottom shows an immense vein of quartz. In 20 shifts, the time that the Florence tunnel was worked in November, the heading, 8x9 feet, was driven a distance of 82 feet, or over four feet a shift through granite and gneiss. This is splendid tunnel work and shows what our skilled miners, backed by ample power, can do. The tunnel is in 350 feet.

IDAHO.

SHEEP MOUNTAIN.—*Idaho Statesman*, Dec. 2: Geo. B. Baldwin says that he left four men at work on his mines at Sheep Mountain, who will continue all winter on three claims in which he is interested, namely: White Goat, Junbo and Birdie R. George says that he shipped five tons of ore from the White Goat the past season that went 260 ounces silver and 25 per cent lead per ton. He thinks he will be able to ship over 100 tons of similar ore from the same mine next season. Mr. Baldwin is interested in nine mining claims in this district. He is of the opinion that the Sheep Mountain country in a few years will be the best mining section in Idaho. The natural outlet is the Wood River valley, and an effort should be made by the commissioners of Alturas county to assist in building a road to that prosperous camp.

ORO FINO.—*Avalanche*, Dec. 6: The new Oro Fino mill has closed down for a few days, for the purpose of repairing and putting in new batteries. It will probably start up again soon.

NEW MEXICO.

BULLARD'S PEAK.—*Southwest Sentinel*, Dec. 4: Another important strike is reported on the Alhambra mine, owned by Miller & Dodd. The ore is almost pure native silver, and there is a considerable quantity of it.

SANTA RITA.—Mr. George D. Roberts and Wm. A. Farish were here several days for the purpose of examining the Santa Rita copper mines. It is reported these gentlemen are endeavoring to induce the French copper syndicate to purchase these mines.

PIÑOS ALTOS.—The Pacific M. Co. has not yet determined upon a location for their reduction works. They will build a 40-stamp mill and such other works as may be necessary to reduce the ores of their mines at Piños Altos. The Aztec Co. has leased the Bremen mill and will convert it into a gold-mill. Preparations have been made to be in running order by Jan. 1st. The consummation of the sale of the Atlantic mine to the Deep Down M. Co. is an assured fact.

GOLD HILL.—The success of the past year which has attended the efforts of the miners of this district is bearing its fruit in the inquiries now being made concerning the mineral resources of this particular region. The developments have been prosecuted under many disadvantages, yet the result of the year's labor has been very encouraging, and the indications for the future, in substance, may be summed up, viz.: The investment of capital, the building of mills, and a home market for the various ores of the district. During the year the abandonment of claims has been exceptionally rare, and those who have "pinned their faith" to this famous camp of the southern portion of the county have been rewarded a hundred-fold.

UTAH.

REVIEW.—*Salt Lake Tribune*, Dec. 7: Eleven months of 1888 have closed, with the bullion product, as per current reports, excluding all ores and not embracing some operations which make but annual reports, as follows:

January.....	\$ 327,141 43
February.....	255,637 79
March.....	283,263 98
April.....	234,019 30
May.....	385,735 14
June.....	333,890 42
July.....	199,083 26
August.....	169,975 46
September.....	312,511 48
October.....	290,521 59
November.....	303,589 30
Total.....	\$3,245,031 86

It is evident that the product of the year will be considerably short of the output of 1887. The receipts in this city for the week ending Dec. 5th, inclusive, were to the aggregate value of \$156,181.51, of which \$83,990.86 was ore and \$72,190.65 was bullion. For the previous week the receipts of bullion were \$155,277.20, and of ore, \$82,203.15, a total of \$237,480.35. The Ontario product for the week was \$13,428.58 of ore sold, and 37 bars of bullion, 21,807.55 fine ounces, an approximate total of \$35,236.13. The Ontario's November product was of bullion 90,540.58 fine ounces; ore sales, \$79,674.92; a total, approximately, of \$170,215.50. The Daily output for the week was \$11,031.29 from ore sales; no bullion. November output of the Daly, \$19,192.75 in ore, and of bullion 70,515.75 fine ounces, an approximate total of \$89,768.51. The Horn Silver is still dormant. It is reported that a new management will take hold on January 1st, no doubt under the auspices of the new directorate chosen at the October meeting. No report of the operations of the mine, if indeed there are any operations there, is obtainable. Fine bar receipts in this city for the week were to the value of \$39,220.42; base bullion, \$884.34. The Hanauer smelter bullion product for the week was \$18,350; the Germania's, \$5745.89. Ore receipts in this city for the week were to the value of \$31,518.67 by Wells, Fargo & Co., besides \$350 in sulphides; \$44,750 by McCormick & Co., including \$8050 Crescent; and \$7372.10 by T. R. Jones & Co.

TINTIC.—*Mining Times*, Dec. 7: Oreshipments from Tintic are crowding the capacity of the Salt

Lake & Western to such an extent that the company has found it necessary to run a Sunday train, an experience new in the history of the line. It is said by those who have an abiding faith in the future of the camp that the present tonnage will be doubled by this time next year.

LEAD.—The week past has witnessed considerable activity in the lead market. Taking the total sales, it is said that upward of 5000 tons have changed hands, and it is believed that this large quantity has gone to bona-fide consumers. The trading observed during the past few weeks has been quite astonishing, and clearly proves that consumers have been working without any stocks, and simply buying what they absolutely needed for immediate use. The white lead manufacturers have been especially conspicuous as buyers, and the smelting companies having come into the market with large offers, a large business has resulted. These heavy purchases taking place at the approach of the darkest season of the year, clearly proves that the trade has confidence in present quotations, and to all appearances it does not seem likely that prices will decline much further, as any slight drop would doubtless bring out more large buying orders. In Europe, consumption also continues on a satisfactory scale.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Dec. 13, 1888.

As usual at this season of the year general trade is inactive. Judging from the tenor of advices the year just drawing to a close has been fairly prosperous, while the outlook for the coming year is favorable to an improvement over that of 1888. This is particularly the case with foundrymen and iron-workers in general. It is asserted with confidence that more mining machinery and other iron work will be required than for several years past. The favorable weather for crops and a heavy deposit of snow, which will supply mining districts with water, are important factors in promoting the confidential feeling which pervades the commercial community. In the local market money is reported to be quite easy, more so than in December, 1887, with a conviction in financial circles that after the turn of the year the ease will be still more marked. The banks report a light call for funds, with deposits showing a gradual increase. The demand for funds to remit to the East is light, while for home purposes the inquiry is limited. For speculative purposes the call for accommodations is growing less as the year draws to a close. There was some inquiry for wheat purposes, but it appears to have about died out, while from dealers and brokers in mining stocks there is very little call for accommodations. The general tenor of advices from those in position to know is confirmatory that a large proportion of outside holders of mining stocks have been sellers, and as strong moneyed parties bought, no funds are wanted to carry their purchases, which aids very materially in giving an easy money market. It now looks as if those who have bought are preparing for a bull movement in the near future to peddle out their holdings at a higher range of values preparatory to another line of assessments. From the Comstock mines all information received is favorable for an upward move. The development in Best and Belcher is of a most promising character, but it will take time to get it in working order so as to take out ore. Con. Virginia is looking exceedingly well on all the levels, while the work going on in the Ophir, Mexican and adjoining mines promises good results within the coming year. In Hale and Norcross and Savage, ore of good value is being taken out and crushed. The Chollar and Potosi mines are getting into better position for taking out more ore when the Nevada mill starts up, which will be soon. The work in Crown Point and Belcher is being watched with great interest so as to demonstrate the richness and extent of the development made in them several months ago, and which by the outside public is forgotten. It is reported that the ore in Confidence and Challenge is grading higher. In Alpha, Con. Imperial and Bullion, exploration work of a favorable character is going on. From the Tuscarora, Bodie and Quipota districts the tenor of advices is of a favorable character. In the latter district it is stated that more extension work is likely to be inaugurated in the Indian Chief group of mines, which experts report to be rich in gold.

Totals.....	\$1,368,878,016	\$1,384,032,533	\$1,406,150,456

SILVER.—The market has ruled firm the past week at the lower quotations given in our last issue. The available supply of silver bullion is small. Some say that the holdings are not pressed on the market, owing to a general belief that a higher range of values will obtain after the turn of the year. The latest sale reported in this city was 92½c, although only 92½c was bid. The output of the mines on this coast is not as large as it was claimed that it would be at the close of the year; doubtless much of this is due to many of the mines being worked for stock manipulation purposes.

London cables quote silver to-day at 42½d. New York telegrams quote silver at 93c. Our market closed at 93c.

QUICKSILVER.—The demand holds up well, both home and shipping. A confidential feeling is expressed that the consumption on this coast the coming year will be all of 25 per cent more than it was in the year drawing to a close. The large deposits of snow in the mountain ranges insure a liberal water supply for working the mines, while many new ones are being developed that will call for considerable quicksilver. The price continues nominally unchanged.

LEAD.—The market, as usual, in December is dull, but the tone appears to be firm in sympathy with the East. Advices from New York report the sales to consumers of 7000 tons in the central markets the latter part of last month.

IRON.—The market is very firm for both spot and

to arrive, but business is at a standstill, and will likely be until after the turn of the year. The strength of the market is due to the strong and high markets abroad, and the home production being under contract. It is claimed that the consumption in 1889 will show a decided increase over 1888.

TIN.—The market for both pig and plate is in buyers' favor at irregular prices. The demand is slow, with large consumers out of the market, except at a lower range of values.

COPPER.—The market is heavy, with very little trading reported. Prices are reported to be tending in buyers' favor. The high prices ruling are promoting active work in several copper mining districts on this coast.

COAL.—House coal is weak under free offerings of coast. Steam coal continues firm under moderate supplies. English coal for shipment and to arrive is strong, but Australian for shipment is in buyers' favor. For May-June delivery, Australian is said to be purchasable below \$9 a ton.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Dec. 13, 1888.—The following are the closing prices the past week:

	Silver In	Silver In		
	London.	New York.	Copper.	Lead.
Thursday.....	42½	92½	\$17 30	\$3 70
Friday.....	42½	92½	17 40	3 45
Saturday.....	42½	92 7-16	17 25	3 50
Sunday.....	42½	92 7-16	17 35	3 50
Tuesday.....	42½	92½	17 40	3 50
Wednesday.....	42½	92 11-16	17 40	3 75

Borax is in moderate demand, but steady. Sales were made at 8½¢ (29½¢); refined, 8¢ (8½¢). Quick-silver was quoted at 60¢ (62¢), but not in a large way. Refined Petroleum—Barrels, \$1.25; plain cases, \$9.25. It is reported that a syndicate has engaged 20,000,000 pounds Lake copper to large consumers for January, February and March at 16½¢, and outside at 17½¢. Pig lead is quiet; workers are well supplied; nominally at 33¢.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

Prices generally ruling for metals not regularly dealt in on Call at the N. Y. Exchange, covering extremes of buyers' and sellers' values. All prompt delivery. Australian Tin, —@—; Biliton Tin, \$24.50@—; Banca Tin, \$24.25@24.50; Baltimore Copper, \$15.00@15.50; Orford Copper, \$16.00@16.25; P. S. C. Copper, —@—; Foreign Lead, \$4.75@5.00; Foreign Spelter, \$6.00@6.25; Antimony, \$10.00@13.50.

TIN.—London quotations have been more than usually influential in determining the course of prices here, except that our futures have been relatively firmer than spot; while in the foreign market the reverse has been the case. Only 30 tons have changed hands all week, although prices have not been absolutely stagnant.

COPPER.—Shows no real improvement in condition of trade, although 50,000 lbs. have been sold in the Exchange, which is the best week's record for November, this having been the dulllest month of the year; in strong contrast with November, 1887, when trading ran up to nearly 20,000,000 lbs.

LEAD.—Gets more and more stagnant weekly, exhibiting this time a record absolutely blank of sales.

SPELTER.—Was nominally steady until toward the end, when a decline of 5 to 10 points was made, closing weak at the lowest point, and has throughout been quiet.

PIG IRON.—The market is very firm on desirable brands. Corawall irons are held at an advance of about a dollar per ton, as the furnaces are sold so far ahead that prices are firm for new business at \$16, \$16.50 and \$17 at furnace for the three grades.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this coast now for 30 years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

THE DUCKER PORTABLE HOUSES

Combine all the comforts and advantages of a permanent building with the qualities of simplicity, strength, lightness, ease of transportation, quickness of putting up and taking down, ventilation, heating, and facility for cleansing equal to any other building.

Is serviceable for Contractors' Uses, for Sheep and Cattle Ranches, Mining Camps, and for Surveyors and Prospectors, Hospitals, Seaside and Summer Resorts, and in all localities where material and skilled labor are scarce, and where it is sometimes desirable to change location. These buildings can be especially constructed for Hunting and Fishing Camps, Billiard Rooms, Photographers' Studios and Law Offices. They are built in sections and are put up without the use of screws, nails or any other external appliances whatever. Two men can put up the building on ordinary ground in 2 hours' time with out skilled labor. Price, \$250 to \$750. Thoroughly reliable and influential business men only, may communicate with the Company relative to getting in its representative.

Address: DUCKER PORTABLE HOUSE COMPANY, 32 Nassau St., New York.

SQUARE FLAX PACKING,

Manufactured from strictly first-class flax and pure lubricants. Superior to all others for Water and Steam. Packs with less friction and makes a tighter joint than any other packing made. 27 Imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all Hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

THE "ECLIPSE" Copying Apparatus.

One thousand copies in black. No special pen, no special paper, no stencil required. The "Eclipse" reproduces the natural handwriting to exceedingly faithful that in most cases "Eclipse" circulars have been taken for ordinary written letters. Specimens and circulars on application.

THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. O. WICKHAM, Taylor Mine, Greenwood, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal. J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application

BRYAN'S ROLLER QUARTZ MILL,

The most perfect Roller Mill made, for the following reasons:

- | | |
|---|--|
| 1. It is cheaper. | 5. Its "clean-up" is quicker and fuller. |
| 2. It is more durable. | 6. It is portable, requires no frame-work, |
| 3. It crushes a larger amount of ore with less power. | and is ready for the foundation as it leaves the shop. |
| 4. It amalgamates a larger percentage of the gold. | |

Full Descriptive Circulars of any of the above sent on application.

OFFICE OF THE CADELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

Risdon Iron Works, San Francisco—GENTLEMEN: Our Company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60-mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screen 12 tons in twenty-four hours; through 50-mesh, 15 tons; and through 40-mesh, 18 tons. This proportion has been continuous. One set of Dies will crush from 1500 to 1600 tons. One set

of Tyres will crush 1500 tons. One ring plate will crush from 2200 to 2300. This mills require very little attention. At our mill an ordinary "peon" earning one dollar per day has complete charge. In regard to eluting, in comparison with stamps by reason of the discharge surface and the continuous agitation by the scraper, a much less amount of elimes is created. A three years' experience teaches me that, in every respect, the mills are a complete success and of material benefit to the mining world. They can be set up and running in 48 hours, and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator, it is unequalled by any mill now in existence.

Yours truly,

D. M. BURNS, Superintendent

1850. 1888.

— BUILDERS OF —
 MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.
 New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ore and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES, THE GREATEST ROCK CRUSHER ON EARTH!

WHAT IS SAID OF IT BY ONE WHO HAS USED IT THREE YEARS.

OFFICE OF ERNEST L. RANSOME, MANUFACTURER OF ARTIFICIAL STONE AND CONCRETE,
No. 508 CALIFORNIA STREET, SAN FRANCISCO, November 9, 1888.

Pacific Iron Works—GENTLEMEN: In answer to your request for my experience with the Gates Crusher would say, that I have used one for the past three years crushing trap rock, basalt and granite for making concrete, the most of it being very hard and calculated to test severely the strength and durability of any machine.

I have crushed in that time probably not less than 10,000 tons of this material, without any repair being necessary, and without any change of shoes and dies, and, as far as I can judge, they appear to be good for as much more service.

I have had more or less experience with nearly every crusher in the market, and regard the Gates as infinitely superior to them all. In fact its efficiency, durability, and capacity for work is simply wonderful. For crushing all kinds of ore, ballast or macadam—fine or coarse—nothing can compare with it. You are at liberty to refer any parties to me who may want further evidence as to the merits of this remarkable machine. Very truly yours,

ERNEST L. RANSOME.

Number 25.

Cheaper Coal.

Our manufacturers as well as domestic users have always had to pay higher for coal in this city than should be the case, and for a year or more past there has been much complaint on all sides, prices being advanced beyond all reason. The result has been that coal from Wyoming and Colorado has been brought into the market by rail. This the coast colliery people are desirous of preventing. It was thought coal would be high again this winter, but it has dropped instead of advancing. Perhaps the mildness of the season has something to do with it. At all events, prices are weakening, greatly

Money in Circulation.

In last week's MINING AND SCIENTIFIC PRESS was published a tabulated statement issued by the Treasury Department, showing the amount of money in the hands of the people of the United States on December 1, 1887, January 1, 1888, and December 1, 1888, which affords an opportunity for a comparison with the currency conditions prevailing a year ago. The first of this month the entire circulation of the country was \$38,277,340 greater than on December 1, 1887. Within the 12 months the gold certificates increased from \$90,780,753 to \$129,264,228, and the silver certificates from \$168,-

like month 1887, on January 1, 1889, the money circulation of the country ought to show a gain of about \$40,000,000 during the year.

AN ELECTRIC-POWER FAILURE.—We noted some time since the fact that the Big Bend Tunnel Co., Butte county, had put in a large electric-power plant, with which to do pumping and other work in the river-bed when laid bare by the water being turned through the tunnel. The electric-power was to have been utilized during the past season, but after many attempts to make it work satisfactorily, without success, the scheme has been given up. The whole plant, dynamos, motors, wire, etc., has been

Mine Hoists.

Hoists for mining purposes may be divided into two classes, viz., single and double hoists. Of these there are again two types—first and second motion engines. In the former, two engines with cranks at right angles to each other are coupled direct to the drum shaft; in the latter the engine carries a pinion, meshing with a spur-wheel keyed to the drum shaft. The rope drums in either case are proportioned in diameter to the size of rope employed, and in length, to depth of shaft. In single shafts but one drum, of course, is necessary, but double-shaft hoisting engines are provided

DOUBLE-SHAFT FIRST-MOTION HOISTING PLANT WITH TWO FUSEE DRUMS.

to the delight of consumers. With Wellington \$4 per ton lower, Coos Bay down to \$7, Seattle, Cedar River and Diamond a dollar lower, at \$10 to dealers, Rocky Mountain grades \$3 per ton off, and sales of Australian steam grades at a loss of \$1.50 to \$1.75 per ton to importers, there is hope of getting cheap coal. A new coal called the Cherry Valley has come into the market. The mines produce about 500 tons per day, and can produce 1000 tons readily when required. The other coast collieries are pushing production. There is considerable coal on the way from Australia, but arrivals of late have been light. High prices have stimulated production and it is thought coal will go a good deal lower before it again advances in price.

SAN FRANCISCO MECHANICS have sent a delegation to the Mayor urging him not to veto the franchise of the Omnibus R. R. Co., recently granted by the supervisors, as the company would have all its iron work done in San Francisco. Mr. Sutro says it will cost \$60,000 to \$70,000 more to have the iron work done at home, but the company has decided to get it done here nevertheless.

THERE are 500 men at Globe, Arizona, working in the copper mines, which are now very profitable.

149,274 to \$231,415,789. The United States notes within the like time shrunk from \$330,362,796 to \$311,478,660, and the National bank notes from \$266,751,131 to \$233,061,711. Of coin in circulation, gold has fallen from \$396,450,216 to \$381,391,086; standard silver dollars from \$64,627,714 to \$60,625,355, while subsidiary silver coin increased from \$51,751,132 to \$52,914,197.

The conversion of large denominations of money into smaller ones has been so rapid that the circulation in coin and notes of \$20 and smaller forms have probably been expanded by nearly twice the amount by which the aggregate has been increased. On December 1, 1887, the aggregate money in circulation was \$1,368,873,016; on January 1, 1888, it was \$1,384,032,833, and on December 1, 1888, \$1,406,150,456. During the month of December, 1887, the circulation increased a little over \$15,000,000, but on and after January, 1888, the circulation steadily declined for several months, or until a demand came in from the Central and Southern States for crop purposes, when an expansion set in and gained in volume until on December 1, 1888, it aggregated over \$22,000,000 more than on December 1, 1887. Taking this as a basis, and if the increase in this month is proportionately larger than was the increase in the

taken out and will be shipped from the mine for sale. The electricians were unable to accomplish the results they had expected. Whether the failure was due to the system adopted or to faulty construction we are not informed, but the fact remains that the plan has been abandoned.

W. C. WILCOX, the inventor of the Wilcox deep-well pump, died at Napa last Saturday. Mr. Wilcox will be remembered by mechanics here as having established, with Mr. Baker, the Wilcox Pump Works, in the same building where the Dow steam pump is now made. He made a very vigorous attempt to displace the Hooker steam pump with his own invention, but did not accomplish his purpose. Mr. Wilcox was quite an inventor and obtained a number of patents on his devices.

ABOUT 2000 new specimens are now being classified and arranged for the museum of the Mining Bureau. One of the choicest lately received is a large nugget from a pocket in the Bonanza mine near Sonora.

THE United States Supreme Court decides that a life-insurance policy is not a part of the estate of an insolvent debtor, and cannot be claimed by his creditors.

with two rope drums, each having a separate rope. The cut on this page shows the general arrangement of a double-shaft, first-motion hoisting plant fitted with two fusee drums. We take the cut from a paper by F. O. Roberts on "Wire Rope Hoistings," read before the American Institute of Mining Engineers.

THE Riverside Press says that another rich silver mine has been discovered within the limits of San Bernardino county. An assay demonstrate that ore which was hardly deemed worth working assays \$454.95 to the ton, and the lucky San Bernardino gentlemen who own it have sent men and teams to open up and work it.

No more lumber rafts will come from Canada. The explanation is that a Canadian law has been passed at the instance of owners of sailing vessels, placing the duty on lumber exported in rafts equivalent to a small margin for profit on the raft system.

THE Rock Springs Miner says: For the month of November the shipments of coal to the Anaconda smelter in Montana amounted, with freight, to the enormous sum of \$103,000. This is only one account with the coal department.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Lixiviation of Silver Ores.

NUMBER 3.

EDITORS PRESS:—In a recent article I suggested that SO_2 , in presence of aqueous polysulphide, might produce H_2S ; on trial I find that it does so. Hence, Mr. Stetefeldt's hypothesis $2\text{Na}_2\text{S}_2 + 3\text{SO}_2 = 2\text{Na}_2\text{S}_2\text{O}_3 + 3\text{S}$ is incorrect; it seems more likely that $\text{Na}_2\text{S}_2 + \text{H}_2\text{SO}_3 = \text{Na}_2\text{S}_2\text{O}_3 + \text{H}_2\text{S}$, which would, as already suggested, round out Mr. Stetefeldt's theory of precipitation very neatly. Unfortunately that theory is untenable for two reasons: Firstly, because sodium sulphate is not formed, as I have just proved once more, and secondly, because no thiosulphate is ultimately lost, as I have also just proved with both weak and strong solutions of polysulphide. I have made some experiments with a view to testing the correctness of my theory of precipitation; the results tend to verify that theory, but are not quite conclusive. In fact, I suspect the reaction is complex, and varying according to conditions.

In view of the fact which I have observed, I must retract my remark that hydrogen sulphide "would not even be produced by acid sulphites," though of course it would not be given off in presence of a metal solution.

The fact that SO_2 causes evolution of H_2S from a solution of polysulphide affords an indication of sufficiency in neutralizing a caustic polysulphide by means of SO_2 .

The two facts that SO_2 and CO_2 decompose a polysulphide in solution, forming H_2S , seem to favor the view that, in presence of water, the hydrogen acids are formed thus: $\text{SO}_2 + \text{H}_2\text{O} = \text{H}_2\text{SO}_3$ and $\text{CO}_2 + \text{H}_2\text{O} = \text{H}_2\text{CO}_3$, as has been enpossed by some chemists.

As bearing on the question of this reaction in the precipitation of silver in the leaching process, I will state that I have made a set of experiments which prove conclusively that, in the precipitation of silver from a hypo solution, neither sulphurous acid nor sulphites are produced, which again shows the incorrectness of Mr. Stetefeldt's theory.

A strictly neutral solution of silver in sodium hypo was treated with a limited quantity of strong solution of sodium polysulphide, free from caustic soda and filtered. The filtrate remained neutral, and a portion of it warmed in a test tube did not give off acid vapors, as shown by a piece of moistened litmus paper within the tube. The experiment was repeated with weak sodium polysulphide and with calcium polysulphide with the same result. Portions of the liquids tested for sulphites by sodium nitroprusside gave negative results.

It is now the fashion to precipitate any lead which may be present in the lixivium separately from the silver and copper. In the Russell process this is done by means of sodium carbonate. In the presence of calcium salts, sodium carbonate will precipitate calcium carbonate along with the lead, hence it is totally inapplicable to the Kiss process and is disadvantageous in the Patera process when the ore contains gypsum which dissolves in the hypo.

Sodium bicarbonate does not precipitate calcium from the leaching solution in the absence of lead, but when lead is present with a calcium salt the precipitate is much contaminated by calcium carbonate. Sodium (or potassium) sulphite precipitates lead completely from its solution in hypo; the lead sulphite settles fairly well, and is a valuable product, having been used as a pigment. The sulphites, like the bicarbonates, do not precipitate calcium (unless added in great excess) in the absence of lead; yet, in the presence of calcium salts, the lead sulphite carries down calcium sulphite, so that it is not applicable to the Kiss process nor to the Patera in presence of calcium. Lead may be precipitated from its solution in calcium hypo containing also silver and copper by means of solution of either chromate or bichromate of an alkali or of calcium. The precipitate is obtained free from calcium, silver and copper, and consists of lead chromate which is a valuable pigment; this method of precipitating lead is equally applicable to the Kiss and the Patera process, the only, or at least the chief, defect being that the precipitate does not settle rapidly in the cold liquid; it might do better if heated.

In the Kiss process the separation of lead may be effected by means of milk of lime, the lead being thrown down as hydroxide. With very pure and newly slaked lime the method may answer fairly, but otherwise it cannot but yield a very impure product; it must be executed with care not to use an excess of lime, or the hypo will become caustic, as calcium hypo readily dissolves a portion of calcium hydrate. An excess of sodium carbonate does no other harm than to check the extraction of lead in the following leaching operation—at least this is according to Mr. Stetefeldt, though I have found it injurious to the extraction of silver in one instance. An excess of sodium sulphite will be converted, wholly or in part, into hypo in the precipitating vats by dissolving some of the free sulphur which always accompanies the precipitated sulphides. A chromate or bichromate used in excess would perhaps contaminate the precipitate of silver sulphide. However, the chromates seem to be the best for use when the lixivium contains calcium salts.

C. H. AARON.

December 10, 1888.

Drawing Water from the Atmosphere.

EDITORS PRESS:—The earth is an oblate sphere—its surface at the poles being 13½ miles nearer the center than at the equator. An ideal section of the earth springing from the equator, passing over and including one of its poles, and resting its other foot upon the equator opposite to the first, would present a perfect arch. Now, if the buttresses be removed, the arch will fall; also, if great weights be piled upon its top, it will be crushed in. The latter process has been going on in regard to the earth's poles ever since ice and snow have been formed upon the earth.

Evaporation takes place chiefly in tropic and temperate zones, and a large portion of that evaporation is carried by atmospheric and electric currents to the poles, where it is deposited as snow or ice. By this process vast accumulations of ice have been piled up at the north and south poles, until an unequal pressure and weight has been aggregated there to an extent which has caused serious disturbances not only in the earth's crust, but also in the inclination of her poles. This excessive accumulation of ice at the poles has unbalanced the planet on her axis, given to it a gyrating motion, and caused a retrocession of the equinoxes by which the year is being gradually lengthened.

It has occurred to me that at least a partial remedy for all this disturbance may be found within the reach of man—that a large portion of the moisture which is constantly finding its way to the polar regions might be intercepted by artificial means, and made to become a benefit and blessing to the inhabitants of the earth instead of a harmful process.

The means to be adopted I would describe as follows:

What causes condensation of moisture on the window-pane which all may have seen? The surface of the glass is covered with microscopic points, and, being cooled, the layer of air next it falls, allowing the vapor vesicles to flow near the points on the glass; but at equal temperatures and pressure the specific gravity of vapor and air is as five to seven; then the vapor can only come five-sevenths the distance, except another force is exerted. This force is the attractive power of the point—the attraction of gravitation. Now, when a vesicle flows upon a point, that point becomes blunted, loses its power of attraction for the time; also the latent heat of the vesicle being rendered sensible and radiant, pushes the vesicles away. These retarding forces prevent all the water in the atmosphere from being poured out so soon as the dew-point is reached. In the zone of maximum moisture, overhead, the dew-point is always present and the vesicles and droplets from friction are highly electrified. Now, if we place a condenser at a proper height in the atmosphere in the nature of a captive metallic balloon electrically insulated, we will have not only the unimpeded attractive power of the point, but impact from the current, and if the cable be an electric conductor, we will have the vesicles and droplets attracted with great velocity, which, at a small outlay, should give a large flow of water where required. The appliance having within about 200 feet radius the rain-attracting power of many acres of forest or mountain, such an apparatus might cost about \$3000.

What causes a waterspout? Increased solar heat forms numerous clouds, which, reflecting solar heat and light toward a focus, gives increased tension and electric excitement to the vesicles around, causing the clouds in the vicinity to be attracted toward the focus, where, being abnormally heated and electrified, the vesicles repelling each other endeavor to escape. Those going upward become condensed, give off their latent heat, which, entering the surrounding vesicles, pushes them away in every direction. They cannot escape laterally because of tension and electric currents. They are therefore pushed downward, and crowded together, intercept the solar rays, so as to form a dense, black, intensely electrified cloud, cone-shaped, to bore its way downward.

Now the specific heat of the earth's crust becomes sensible from pressure as we descend; and the inclosed water is converted into steam, causing evaporation night and day from pressure. When a black electrically positive cloud from above comes within the attracting distance of the negative vapor in the water, a rushing to the point occurs, an upward cone is formed and connection through the comparatively dry air—non-conducting—near the surface being completed, the waterspout is formed, always fresh though from the ocean, being formed from vapor. We need only then cause negative excitement on the earth's surface to force the water from above downward. There is always abundances of water in the atmosphere as vesicles and droplets. See *San Francisco Evening Post*, Nov. 20, 1886, "After the Earthquake Rain from a Cloudless Sky." In this instance the steam generated within the earth caused such negative excitement as to act on the positive vapor through crust and dry air at surface forcing the rainfall on Mr. Hoyle's farm near Dawson.

Again: *San Francisco Bulletin*, Nov. 18, 1888, "Rain and Railroads." In this case the rails become magnetized from jolting and cause the electric current overhead to deflect from its north and south direction at right angles, causing a stasis or jam of ice particles, forcing them to fall from gravity and set up the action of rain. Also the trucks running struck the key-note of thunder with proper amplitude of vibration, producing rain likewise. These

are some methods explained—and there are others—whereby rain in abundance can be had as required so as to open up all the deserts and in time the polar regions for settlement and wipe out epidemics; for when water is withdrawn from atmosphere by art, ice, to a corresponding extent, is removed from the poles and with it the cold.

I ask this opportunity of explaining to the public so that complicity be at once formed to operate for the common conservation.

MICHAEL CAHILL.

San Francisco, Dec. 15, 1888.

The Australian System of Voting.

The Australian mode of voting is beginning to attract attention. It is no experiment. For several years it has been in successful operation in England, Scotland, Ireland and Canada. It has been adopted in Massachusetts, and will go into operation in 1889. It passed both Houses of the New York Legislature at the last session, but was vetoed by Gov. Hill. The object of the system is to prevent bribery and intimidation, overthrow as far as possible the dangerous power of bosses and political machines, and place all candidates upon an equality before the law.

Upon approaching the polls, the voter receives at a convenient place, from two officials selected from the opposite political parties, a single ballot, on the back of which is indorsed a stamp or signature sufficient to identify the ballot as official. On the face of this ballot is plainly printed the names of all the candidates, designating the respective office for which each one aspires. This ballot is in the following form:

	For Mayor.	Vote for One.
Democratic,	John Doe,	
Republican,	Richard Roe,	
Prohibition,	David Smith,	
Independent,	Samuel Jones,	
	For Coroners.	Vote for Two.
Democratic,	Alanson Jacobs,	
	Harvey Sylvester,	
Republican,	Martin Rawson,	
	Wyman Simpson,	
Prohibition,	Valentine Remsen,	
	Victor Sampson,	
Independent,	Erastus Myers,	
	Samuel Bixby,	

On receiving the ballot, the voter passes into a booth where he is absolutely secured from observation, and prepares his ballot by placing in the blank columns a cross opposite the name of each candidate he wishes to vote for. He may write in the blank places the names of each candidate he desires to vote for, if he prefers. If there are several candidates for the same office, as the coroners, for instance, in the above example, or Presidential electors, and he wishes to vote a straight party ticket, he must place the cross under the party name, or draw it through the blank column allotted to the party's candidates. This means that he has voted for each candidate named in the aforesaid space.

After he has thus prepared his ballot, he folds it in such a way as to wholly conceal the face and expose the indorsement on the back. The ballot is then passed to the inspector, who recognizes it as proper from the indorsement. It is then dropped into a box and the voter gives way for others. But from the time he has received the ballot till it is voted, he is allowed to have no communication with any one but the election officers, and with them only for official purposes. No person is allowed to be present in the polling-places or about it but the election officials.

Upon proof that the voter is illiterate or physically unable to read and fold his ballot, he may call into the booth officers appointed and sworn for the purpose, who may aid him in preparing his ballot. When a ballot is accidentally destroyed or defaced, it may be exchanged for a clean one. To secure absolute secrecy, every ballot must be voted or returned. This explains the need of the official indorsement. Were it not for the indorsement, a piece of blank paper outwardly resembling the ballot might be voted, and the voter would then be able surreptitiously to carry away an official ballot which could then be prepared by a bribed voter. Such a fraud was long known in the Colonies as the "Tasmanian dodge," and was successfully perpetrated in Australia till the Government cured the evil by requiring every ballot to be indorsed and returned if not used.

Under this system it is absolutely essential that the ballots be printed at public expense and distributed by officials appointed for that purpose. This makes it necessary that the candidate of the respective parties be certified to the proper authorities at least 15 days before the election, and local elections at least ten days. The scheme proposed by the Yates-Saxton bill of New York, which Governor Hill vetoed, is perhaps as convenient as could be made. Under it, State nominations were to be certified within 15 days before the election, and local nominations 10 days before election. Nominations of a political party which at the next preceding election polled three per cent of the whole vote were to be certified by party officers; independent nominations, if for a State officer, were to be certified by a thousand voters, and if for a local office by a hundred. Having outlined the Australian system of

voting, we may summarize some of the reasons that are assigned for its adoption. Penal laws have been made to prevent bribery and intimidation. It is a well-known fact that they have been largely ineffectual. The only remedy is the most absolute secrecy, and under the Australian system this is secured. The most timid among hirelings and dependents is therefore secure. The only proof possible of an elector's vote is his own uncorroborated statement. No other is possible. This is fatal to bribery. Bribers are not likely to invest money on the faith of a bribed man's naked assertion.

The Australian system banishes corruption funds. Under our system ballots cannot be printed nor distributed without money, and are not liable to be faithfully handled unless the trusty workers are rewarded. The election committee having this in hand have a plausible reason for demanding money from its beneficiaries and official patronage from the successful party. It is the necessity for funds that justifies assessments and gives a color of voluntary contribution to what are in fact sales of nomination and office. In short, it garnishes on the outside as party fealty what is really a corruption fund. This develops into political jobbery, and offices are bought and sold as the *Pætorian* guard sold the Roman purple. Poor men can obtain no political advancements without being burdened with obligations they are unable to redeem unless they resort to fraud and perjury. Under the Australian system this political monster would be destroyed. When the State assumes the function of providing ballots there would no longer be the necessity for workers at the polls. The excuse for raising and using corruption funds would disappear. There would be no need of assessments. Political machines would become a thing of the past. Trafficking in office would be replaced by political dissection and the power of the machine by the voice of the party.

A moment's thought will show that this is no chimerical conclusion, that these and other abuses would be effectually removed by this method. The ballots containing the names of the candidates are printed at the public expense, only one official ballot is delivered to the voter, and that by sworn officers; the voter is utterly secluded when he prepares his ballot, and from the time he receives it till it is dropped in the box he has no communication except with the election officers. The whole thing is veiled in absolute secrecy, and secrecy is the remedy for many evils.

The Sight-Seer's Headache.

Of the lighter penalties which pleasure entails, none probably is more widely known and felt or more persistently endured than the sight-seer's headache, remarks a writer in a contemporary. It is nature's tax levied on the comfort of that great body of happy idlers to which we all at some time or other belong. It is epidemic among the frequenters of museums, picture-galleries and exhibitions. The very general prevalence of this variety of headache, and its independence in many instances of any vitiation of the atmosphere, teach us to look for its explanation in other causes. The effort of mind implied in long-continued observations, even though this does not involve the strain of study, has probably an appreciable, though a secondary, influence.

Fatigue certainly has an important share in its production; but it is with most persons rather fatigue of muscle than of brain. The maintenance of the upright posture during several hours of languid locomotion, the varied and frequent movements of the head, commonly in an upward direction, and the emilar and equal restlessness of eyes whose focus of vision shifts at every turn as a new object presents itself, form a combined series of force more powerful in this respect than the enlightenment and frequent change of mental interest and attention by which they are accompanied. The muscular strain implied in these movements is necessarily very considerable. It affects more or less every member of the body, but the distant localization of the resulting ache has probably much to do with the unusual activity of the cervical extensor and rotator muscles, and of the muscles which move the eyeball. Whatever the minor influences at work, therefore, there can be little doubt that mere fatigue is primarily accountable for this most general form of headache, and that rest and nourishment are most reliable antidotes.

The utility of stimulants for this purpose is necessarily temporary and deceptive. One improvement on existing arrangements ought to be of real assistance to the suffering sight-seer, if more generally introduced by responsible authorities. The comparative scarcity of seats in many places of amusement has often been noticed. It would be much to the public advantage if this want were supplied. For the attendant at exhibition stalls a chair for occasional use is an absolute necessity.

At Portland the highbinder have been ordered from town. The Chinese merchants co-operate with the authorities in thus getting rid of a lawless and murderous crowd.

THE Fresno *Republican* says coal from local mines at \$7 a ton settles the cheap-fuel question in that city.

THE trustees of the Lick estate have expended altogether about \$2,000,000 and have still \$917,000.

Educated Indians.

Our engraving affords material for interesting studies in physiognomy. It represents a recent graduating class at an Oregon institution for the improvement of the Indian, known as the Indian Training School, which is located in Marion county, four miles north of Salem.

The school was formerly located in Washington county, at Forest Grove, a lovely little village, situated 25 miles from Portland. It was organized by Capt. M. C. Wilkinson, a philanthropic gentleman belonging to the army, who was detailed from that body for this purpose. The school opened in 1880 with 14 boys and four girls from the Puyallup reservation.

The old school buildings were destroyed by fire in 1885, and thus nearly 200 children, big, little and old, were homeless. Just where to go or what to do, none knew.

It was finally decided to locate the school

housework and needlework, and by the supervision of superintendents do the sewing, cooking, washing, ironing and mending for all the children of the school.

When first brought from their native woods and wilds, they show a decided dislike for all rules, regulations and usages of the school. They stand around and maintain a stolid quiet, refuse to talk or answer questions, are sullen and stubborn, show indifference to all things. By observation and force of example they are led little by little to "fall in line." They take most readily to the military drill and fall in line at call of bugle.

Persons are admitted to the school from 7 to 30 years of age, and are kept in school six years or more if necessary.

With reference to Representative Butler's bill for an appropriation of \$1,000,000 for a 60-inch telescope to be mounted in the National Observatory, Alvin Olark, the renowned maker

Animal Chlorophyl.

A correspondent of the *Journal of the Franklin Institute* contributes to that publication the following notes on the occurrence of animal chlorophyl: Out of 12 species of sponge examined by Prof. MacMunn, ten contained chlorophyl; adding to these seven sponges studied by Krukenberg, we have 17 sponges proven to contain chlorophyl by means of spectroscopic examination and chemical reagents. With regard to this chlorophyl, Prof. MacMunn says: "I have no hesitation in saying that no difference worth mentioning was observed between it and vegetable chlorophyl." Chemical reactions proved it to be of purely animal origin; marine algae are often to be found growing into the sponge substance, but great care was taken in these experiments to select portions in which, even when examined microscopically, with powers up to 1250 diameters, no vegetable growth appeared. Prof. MacMunn does not think it necessary that the co-existence of starch with chlorophyl should be demonstrated in order to prove the presence of animal chloro-

THE WEAR OF RAILS.—The comparative wearing qualities of iron and steel rails formed a very fruitful topic of discussion at one time in railroad circles, but the question suddenly lost its vitality when the price of steel rails fell below the cost of production of iron rails. It is, therefore, a matter of much less interest than would have been the case, say ten years since, to note the experience in this respect of the Wabash railway, which has just been made public. The company removed from its tracks some iron rails which had been first laid down in 1856, and about the same time they took up some English steel rails which were first used in 1873. The iron rails, after a life of 32 years, were sold to be remanufactured, and the steel rails, which had been in use for 15 years, were relaid on a branch road, where they are expected to last for 12 to 15 years more. The "expectation of life" in either case would therefore seem to be nearly the same, with the difference in favor of the iron rails, probably due to the fact that the latter began their career in an era of less traffic, slower trains, lighter locomotives and smaller freight cars.

Photo-facsimile.

GRADUATING CLASS OF 1886, INDIAN TRAINING SCHOOL, CHEMAWA, OREGON.

Dewey Eng. Co.

at Chemawa, and equip the undertaking more elaborately and in keeping with the name and position of a Government like ours. The school grew and flourished abundantly under its first president, Rev. Mr. Minthorn, and Prof. Coffin, principal teacher. The school has now been in successful operation at its present location for three years, with Prof. John Lee as superintendent. There are now 180 Indians in attendance from the various tribes, representing in all 29 different tribes, from all along our coast, from Alaska to California, and from Montana to Oregon. There are 72 girls and 108 boys. The school is limited to 200, and much difficulty is encountered in keeping up this standard of attendance. The pupils are taught in four grades, boys and girls together, in the public schools. The studies of the fourth or highest grade are arithmetic, grammar, physical geography, Child's Book of Nature and History of the United States. They are constantly going and coming. They are a prey to homesickness. The restraints of the school, its surroundings and all, are most burdensome and overwhelmingly oppressive to the Indian, and in desperation he seeks relief and freedom by "running away."

The boys are instructed in trades and farm labor, many of them showing no little skill in the use of tools. They are taught shoemaking, cabinet work, blacksmithing and wagon-making. The girls are taught

of lenses, says he does not believe that better results can be obtained by constructing so large a glass—that is, provided it is located on the Atlantic Slope. The 26 inch glass at the Harvard Observatory is, he says, large enough, but in the wonderfully clear air of California and the Pacific Coast region, he says the largest-sized glasses can be used with effect.

THE bullion statement of the Consolidated California and Virginia mine for last month is as follows: Total ore worked, 9347 tons. Total bullion produced—gold, \$105,422.74; silver, \$114,951; total, \$220,373.74. Assay yield on bullion per ton—gold, \$11.27; silver, \$12.29; total, \$23.57. Average assay value of the ore per ton, \$28.42.

THE Santa Paula Chronicle says: An abundant flow of oil has been struck by the Sespe Oil Company, in well No. 18, in which boring has been in progress for some weeks. One hundred barrels were pumped in the first 15 minutes after it was opened.

MR. WENBAN, the owner of the Cortez mine, Nevada, states that the mine has not been sold in London as reported. It was incorporated in London, so that in case of his death it would be in better shape than if he held it as an individual.

A NUMBER of wild geese were found dead at the base of the electric-light tower in Chico last Saturday morning. It is supposed they dashed against the lantern during the night, which was unusually foggy.

phyl. Even in plants it is not always possible directly to observe starch as the product of assimilation in the chlorophyl grains; in such cases the starch produced in the chlorophyl may be at once transformed into fat.

If chlorophyl is present in sponges, the question arises, of what use is it to them? It cannot be of use for mere surface coloration, as its tint is, in most cases, disguised by yellow, red or other color, and it must, therefore, be of use, either for purposes of assimilation, as in plants, or for respiration. Since chlorophyl is usually much more apparent in the external parts of the sponge, it is likely that it has something to do with the absorption of light rays. Prof. MacMunn "cannot help thinking that the very peculiar absorption spectrum of chlorophyl indicates a property which is peculiar to it, and which enables it to sift out rays of a certain wave-length to be utilized in the syntheses of the carbohydrates." The latest researches suggest that chlorophyl may be a respiratory pigment, and all recent botanical knowledge tends to explain its function as that of a carbonic-acid carrier. It may primarily remove the waste CO₂, and afterward, by the influence of light rays, build up from CO₂ and from water, some substances, such as starch, glycogen, sugar or fat, which are of direct service to the animal or plant. If this is its function, chlorophyl may be of great use in the constructive metamorphosis of animals.

PROF. FOREST SHEPHERD, who had made a thorough study of mineralogy and mining, and was well known as a specialist, died at Norwich, Conn., lately, aged 88.

Nevertheless the facts cited go far to sustain the position of the erstwhile advocates of the continued use of iron rails, that well-made iron rails would sustain the wear and tear of regular railroad traffic as well as steel rails. It is worthy of note, in this connection, that the Wabash steel rails cost \$103 per ton, in gold, in 1873, and that the old iron rails were recently sold for more than three-fourths the price of new steel rails, ton for ton.

IMMENSE sales of oleomargarine are reported in Cincinnati and Chicago on account of a rise of 5 cents a pound in creamery butter. Chicago is trying to control the butter market.

A PARK county, M. T., jury recently made the mistake of returning a verdict that "this jury do hereby agree to disagree," and Judge Liddell fined each member \$5.

It is reported that the Rothschilds have purchased the Santa Rosalia copper mine, in Boleo district, near Mulege, on gulf side of the Lower California peninsula.

COAL has recently been found in the Gabilan mountains, southeast of Salinas, and also in the hills near San Luis Obispo.

THE output of the Oregon Iron and Steel Company at Portland is 48 tons of pig iron and 25 tons of iron pipe each day.

SUITS have been commenced by the Government against Nevada parties for \$13,000,000 for cutting timber.

Passing Events.

The Ridgeway mine, New River district, has been sold to an English company and Major Toms, one of the owners, has returned from London. We gave an account of this mine some time since, when we saw Major Toms, who was then on his way to London. The advent of capital into New River would not only benefit that camp, but other portions of Trinity county.

There is quite an excitement at Needles, Cal., about reports of a gold-find 20 miles south of that place, and numbers of men are leaving for the new field.

Amador county is having luck of late in good strikes in old mines. Recently the North Star, at Sutter Creek, struck exceptionally rich ore, and now the Wildman, at the same place, has struck it. At a depth of 600 feet the superintendent reports a 12-foot ledge of \$10 rock.

The Phoenix Herald of the 10th says: The Wratten strike in Centennial district is said to be the biggest thing in the mining business ever

discovered in Arizona. Three men took out \$36,000 in seven days. There is some feeling among ironworkers and other mechanics in this city about individuals and street-railroad companies sending East for ironwork instead of having it done here. One company, whose franchise is pending, has finally agreed to do the work at home, and pressure will be brought to bear on others to the same end.

The Coming Eclipse of the Sun.

Suggestions to Observers.

The total solar eclipse of the sun which occurs on Tuesday, January 1st, 1889, is a very important astronomical event, and a number of parties will be in the field in this State and Nevada for observation. The general direction of the path of the total phase through California and Nevada is northeast of compass. The breadth of the path of totality is 93 miles, as shown in the map published in the PRESS on November 10th. San Francisco is 55 miles southeast of the southern limit of this path of totality, so that in this city the sun will be only about eleven-twelfths obscured. It is so rarely that an opportunity such as this offers that no doubt a great many people besides the astronomers and photographers will go from this city to points on the line of totality.

The beginning of a total solar eclipse is marked simply by the small black notch made on the luminous disk of the sun by the advancing edge or limb of the moon. This always occurs on the western half of the sun as the moon moves from west to east in its orbit. An hour or more must elapse before the moon has advanced sufficiently far in its orbit to cover the sun's disk. During this time the disk of the sun is gradually hidden until it becomes a thin crescent.

Time Signals.

The Director of the Lick Observatory, Prof. E. S. Holden, has compiled from various sources a number of brief suggestions which will be of use to intending observers. On the 29th, 30th and 31st of December and on the 1st and 2d of January, the time signals of the Lick Observatory will be sent to nearly every railway station in California automatically from a standard mean-time clock. Observers should compare their watches with the beats of the sounder at noon in the nearest railway station, when possible. These signals will be similar to the regular noontime signals of the Observatory which furnishes the official time to the Southern Pacific Co. These signals commence with a warning "rattle" between 11:56 and 11:57, Pacific standard time; there is then a pause of one minute (during which the wires are cleared for the transmission of the "noon signal"), and the first beat of the clock, which will be heard at the distant telegraph stations, is 11h. 55m. 00 sec. of Pacific standard time. Thereafter the clock will beat every even second—leaving out the 58th second. The first beat after this short pause is 11:59:00, and the clock will continue to beat the even seconds until 11:59:50, when there will be a pause of 10 seconds, and the last beat heard will be 12:00:00 noon of Pacific standard time (equal to 8:00 of Greenwich mean time).

If it is not practicable to visit one of the railway telegraph stations at noon for these signals, the beats of the Lick Observatory clock may be heard by telephone at any time of the day by following out the directions given below:

To hear the beats of the Lick Observatory Standard clock, call the central office, and ask the San Jose operator to put on the Lick Observatory clock signal. When this is done, the beats of the Lick Observatory clock will be heard every two seconds. At the end of every minute the 58th second is omitted. At the end of every 5th minute (0, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60), the 52d, 54th, 56th and 58th seconds are omitted.

To set your watch right: Get the beats of the Lick Observatory clock in your telephone, and hold your watch where you can see the second hand; listen to the beats, which are heard every two seconds, until a pause of more than two seconds comes; the first dot after such a pause begins some minute. If the pause is ten seconds long, the minute is one of the numbered minutes of your watch-dial.

Prof. Schaeferle of the Lick Observatory has computed for Prof. Holden the approximate Pacific-Standard time of the beginning and ending of the total phase, and his results are exhibited in the following table. They will serve a useful purpose in enabling intending observers to select a suitable station:

The point of first contact will be about 91° from the north point of the sun's limb measured toward the west.

What to Expect.

It may be observed that the actual amount of the sun's light may be diminished by two-thirds or three-fourths of its ordinary amount without its being strikingly perceptible to the eye. What is first noticed in an eclipse is the change which takes place in the color of the surrounding landscape, which begins to wear a ruddy aspect. This grows more and more pronounced, and gives to the adjacent country that weird effect which tends so much to the impression of a total solar eclipse. The color of the light becomes more and more lurid up to the moment when the sun has nearly disappeared. If the spectator is upon the top of a high mountain, he can then begin to see the moon's shadow rushing toward him at the rate of about a mile a second. Just as the shadow reaches him, there is a sudden increase of darkness; the brighter stars begin to show on the dark lurid sky, the thin crescent of the sun breaks up into small points or dots of light, which suddenly disappear, and the moon itself, an entirely black ball, appears to hang isolated in the heavens.

An instant afterward the sun's corona is seen surrounding the black disk of the moon with a soft effulgence quite different from any other light known to us. Near the moon's limb it is intensely bright, and to the naked eye, uniform in structure; 5' or 10' from the limb this inner corona has a boundary more or less defined, and from this extend streamers and wings of fainter and more nebulous light. These are of various shapes, sizes and brilliancy. No two solar eclipses yet observed have been alike in this respect. These appearances, though changeable, do not appear to change in the time the moon's shadow requires to pass from the first contact with the earth to its last.

Superposed upon these wings may be seen (sometimes with the naked eye) the red flames, or protuberances, which were first discovered during a total eclipse. These need not be more closely described here, as they can now be studied at any time by the aid of a spectroscope. These are the appearances to the naked eye. In the telescope the corona appears a very complicated structure. It was formerly doubtful whether the corona was an atmosphere belonging to the sun or the moon. At the eclipse of 1860 it was proved by measurements that the red prominences belonged to the sun and not to the moon, since the moon gradually covered them by its motion, they remaining attached to the sun. The corona has also since been shown to be a solar appendage.

The total phase of a solar eclipse lasts for a few minutes (never more than six or seven, and about two minutes only at the eclipse of January 1, 1889), and during this time, as the eye becomes more and more accustomed to the faint light, the outer corona is seen to stretch further and further away from the sun's limb. At the eclipse of 1878, July 29th, it was seen to extend more than 6° (about 9,000,000 miles) from the sun's limb. Just before the end of the total

phase there is a sudden increase of the brightness of the sky, due to the increased illumination of the earth's atmosphere near the observer, and in a moment more the sun's rays are again visible, seemingly as bright as ever. From the end of totality till the last contact the phenomena of the first half of the eclipse are repeated in inverse order.

The phenomena of a total eclipse are so various, so startling, so impressive, and so novel and fascinating, that those engaged in observation will do well to confine their attention to that special portion which they can best observe, leaving the other portions to other members of the party. During the observation of an eclipse, it is necessary that quiet and stillness should be maintained. People who are only looking on with the naked eye should be careful not to disturb observers who are using instruments for precise observations. Those who intend reporting to the Lick Observatory should state the nature and character of instruments used with details of size, power, etc. Notes at the time should be brief and condensed, but written out at length afterward and without conferences with others.

Choice of Observing Station.

A position should be selected which is free from the annoyances of sand, dust, and dazzling reflections from water, and the noise and din of a thoroughfare; which affords a clear view of the portion of the heavens to which the attention will be directed, and an unobstructed meridian, if precise observations for time are contemplated; and elevated above the ordinary range of fogs, where fogs are to be apprehended. The place should be noted and described, and its bearing and distance from some public building or prominent landmark should be determined. It should be resorted to one or more days in advance in order to have everything in readiness and suitably arranged.

Observations of the Contacts.

These observations consist in observing the instants of beginning and end both of the eclipse and total phase, together with the positions of the points of contact, and serve to give a precise determination of the moon's place. It is desirable that the beginning and end of the eclipse should be carefully observed at all fixed observatories within its limits. The beginning and end of the total phase can only be observed within the belt of totality. The value of such observations depends on the precision with which the instant of contact is appreciated and its time recorded and the exactness with which the correction of the chronometer and the latitude and longitude of the place are determined.

Near the Limits of the Shadow.

The intelligent inhabitants of towns near the edge of the belt of totality may furnish observations by which the limits can be accurately determined by simply noting how many seconds the sun is wholly obscured. The following directions for doing this are mostly taken from a circular issued by the U. S. Naval Observatory asking for observations of the eclipse of August 7, 1869:

Instruments.

The only indispensable instrument is a good watch, provided with a seconds-hand, and having a white face. It may be well to provide a lighted lantern for use in case of necessity. The minute-hand of the watch should be carefully set so as to be on the exact minute when the seconds-hand is at 60s. This being done it is no matter how far wrong the watch may be.

A good auxiliary will be a common spyglass lashed to a round post so as to be steady enough to give an easy view of the sun. To lessen the brilliancy of the sun, cover the object-glass with a pasteboard, tin, or wooden cap having a round hole three-fourths of an inch in diameter cut in its center.

The spyglass will be worse than useless unless one is accustomed to its use, and has it fastened so as to be steady.

An opera-glass held in the hand may also serve a good purpose. A smoked glass should also be prepared, but one part of the glass should be smoked very lightly so that it can be used should the day be cloudy.

Arrangements.

Each observation should be made by a party of three persons. Only one instrument of each kind—watch, glass, etc.—is needed by a party. A station should be selected where they will be free from all interruption, either in the open

air or at an open window, facing south or south-west. Be sure that the sun can be seen from your station at 1:30 P. M., by a trial one or two days before the eclipse. One, at least, of the party must have a pencil and notebook at hand to record the time.

The Observation.

When the visible part of the sun is reduced to the narrowest crescent, the holder of the watch, keeping his eye on the face, will begin to count the seconds aloud; the holder of the smoked glass, with or without the spy-glass, will watch for the last ray of true sunlight, being careful to look through the brightest part of the glass the eyes will hear without inconvenience; and the third observer, if there be one, will look for the disappearance of sunlight with the naked eye, and stand ready with pencil and paper to record the time. When the last ray of the sun has disappeared, the observer with the glass will call "time," and the exact second at which the call was given must be immediately written down. The minute most has also carefully noted and immediately recorded. It is best to record the seconds first, and then the

is of the opposite kind, and should be equally avoided. It is that the light of the brilliant rose colored protuberances which surround the dark body of the moon during the total eclipse may be mistaken for sunlight, and thus the critical moment be suffered to pass. The return of sunlight will also be preceded by a reddish glow on the border of the dark moon, which must not be mistaken for the sun. All the recorded times, etc., should be forwarded to the Lick Observatory.

Drawings of the Corona

Spectroscopic observations are of special importance during the total phase. The meteorological observations should include the ordinary record of the barometer, dry and wet bulb thermometers, wind, clouds, etc. Near and during the total phase the changes of the thermometer and hygrometer, formation of clouds or fog, or dew or other atmospheric variations, should be specially noted. Drawings of the corona should also be made by those able to do so.

A really important observation can be made in the following way: Place a circle of wood or iron, 12 inches in diameter, near the top of a telegraph or other pole, and place the eye at

The Round Valley Reservoir.

One of the largest enterprises in Plumas county, this State, is the Round Valley reservoir and water-works owned by Messrs. McGill & Bidwell. The reservoir is at an elevation of 800 feet above Indian valley. An engraving of the dam and reservoir is given on this page. The construction was commenced in 1868, and up to this date represents a cost of over \$100,000. Its purpose is to supply the mines of Greenville district with the necessary water. Those dependent upon the reservoir are the Johnny Bull, Drury, Pacific, Forest King, the Chabroes group, Round Valley Consolidated, New York, Plumas Con., O'Tool and Summit, McLeslan Claims, Green Mountain, and others. The company have eight miles of ditch for the distribution of the water, on the line of which is an inverted siphon composed of 5000 feet of 22 inch pipe crossing a canyon under a pressure of 400 feet. The company make their basis of rates for water furnished on 50 per cent of cost of steam-power, including the water used for battery purposes. This estimate is made with the assumption that both plants are on the

Brewster's Amalgamator.

In the PRESS of December 8th appeared a communication from Geo. J. Rockwell, giving an account of tests of ores at Bodie, in which it was stated that the Brewster amalgamator possessed "none of the merits claimed for it." We are informed by the superintendent of the Standard Consolidated M. Co. that there were four tons of ore worked by Mr. Rockwell, as directed by him, and the results were as given in the communication; but he says nothing of the cost of the run, which far exceeded the receipts. As to the Brewster amalgamator, there was but a small quantity of ore worked by that, the experiments being mainly confined to tailings. There is no doubt that the amalgamator is of no advantage in working Standard ores, but this should not give the idea that the machine is of no benefit anywhere. The amalgamator is doing good and satisfactory work at the Homestake mine in the Black Hills, and seems well adapted to the ore there. While Mr. Rockwell's statement is correct as to the fact of the machine being of no benefit in working the ores at Bodie, it has

THE ROUND VALLEY RESERVOIR AND DAM.

minutes. The observers will then await the return of sunlight, the count of seconds being kept up. The first flash of true sunlight will seem to burst out suddenly, and the minute and second of its appearance must be immediately recorded with the same care as the time of disappearance. The difference of the two times gives the duration of totality.

Valuable observations of the duration of totality can be made at any points at or near the limits of the line of totality, in particular at or near the points named below. Observers should remember that the fact that the eclipse was not total at their stations is just as important as the other fact that the duration of totality was one, two or three seconds. If these observations are carefully made, and promptly communicated to the Lick Observatory, they will serve a useful purpose.

Special Precautions.

In appreciating the beginning of totality, there is danger of error from two sources. The first is, that the sun's crescent may become so narrow as to become invisible through the smoked glass, if this be too dark, several seconds before it is really all covered, and thus the observer may call the "time" too soon. Such a mistake may be detected and corrected by the third observer looking on with the naked eye, if the following circumstances be attended to:

The beginning of total eclipse is marked by a very rapid increase of the darkness, caused by the advent of the moon's shadow. If, then, the darkness increases more rapidly after time is called than it did before, time was called too soon, and must be repeated. The other danger

about 57 feet from the disk, so that at the time of totality the center of the disk will cover the center of the sun. The position for the eye can be approximately determined on the days immediately preceding the eclipse, and a stake can be firmly driven, over the very top of which the observer is to look at the totally eclipsed sun. The sun and the inner (and brighter) corona will be bidden, and the eyes can then follow the outer and fainter portions with ease and estimate their directions (angles with the vertical post) and their lengths (in diameters of the disk). The eye should be kept in darkness up to the beginning of the total phase. It is to be hoped that photographers making pictures of the eclipse will send the original negatives to the Lick Observatory.

Excursions.

A big special excursion to run from this city to a point near Willows on the central line of totality of the New Year eclipse has been arranged by the Southern Pacific Company. Already many persons have expressed a desire to make the trip on this occasion, and no doubt there will be a full trainload. The train will leave here early in the morning of New Year's Day, and the passengers will arrive at the point of observation in time to get a full view of all there is to be seen concerning the eclipse, and they will return here in the evening of the same day. It is probable that a round-trip rate of \$5 will be made to other railroad points on the line of totality of the eclipse.

A rich silver strike has been made in the Badger mine, near Port Arthur, Minn.

ground. Thus, while furnishing the company with a handsome revenue, the mines are supplied at an exceedingly low cost. As high as \$1400 per month has been realized by the company from the water.

Owing to light winters for the past two years, the supply of water, which depends upon snow and rain, has been short, and the company has been unable to supply the demand. They have hopes to secure a good supply this season. The dam proper is 300 feet long and 25 feet in height, constructed with a rock-wall in center and loose dirt on sides. It is the most natural site for a reservoir imaginable, and its location is quite picturesque. It covers 800 acres and will hold an average depth of 15 feet of water, and has a watershed of 40 square miles. An item of no small moment is the fact that it is surrounded by miles and miles of the best timber in the State, from which must ere long spring a lumbering industry of great magnitude. Then will this great water storage be of utility in furnishing the power to run the mills that will be called into operation by lumbermen, after which it may be conducted to the fertile lands of Indian valley for irrigation.

GOVERNOR WATERMAN has said that he will not give his sanction to the bill appropriating money to the London Exposition unless the same aid is extended to the Paris Exposition, which is to be held in 1889.

CHRISTMAS will be here on Tuesday, and the PRESS wishes all its patrons a very merry and happy one. We might do this much more at length, but scarcely with more heartiness.

proved successful on ores elsewhere, and is now being generally introduced at various camps. The wording of Mr. Rockwell's paragraph on this part of the subject conveys, therefore, a wrong impression.

ACADEMY OF SCIENCES.—At the last meeting of the Academy, T. H. Hittell read a paper on the subsidence of the peninsula of San Francisco. Some fossil redwood logs and the bones of sa-lions not yet fossilized were recently found, he said, 112 feet below the surface by some laborers who were digging a well for Adolph Sutro on the San Miguel ranch; near the Almshouse. The committee appointed for the purpose of presenting a regular ticket for officers for the ensuing year, reported as follows: Pres., H. W. Harkness; 1st Vice-Pres., H. H. Behr; 2d Vice-Pres., George Hewston; Cor. Sec'y, Fred Gutzkow; Rec. Sec'y, J. R. Scupham; Treas., J. E. Tayer; Librarian, Carlos Troyer; Director of Museum, J. G. Cooper; Trustess, Charles F. Crocker, D. E. Hayes, S. W. Holladay, E. J. Molera; Irving M. Scott, George C. Perkins and John Taylor. Alphas Bull and Walter E. Bryant were appointed inspectors of election and Chas. Stephens and C. D. Gibbs, judges of election. The election will take place on January 7th.

WORK has commenced on the Cuyamaca railroad, San Diego Co. One trainload of rails has arrived, and three steamers are on the way with ties.

THE Legislature is to be asked to contribute \$250,000 to maintain a California exhibit in London for two years.

MECHANICAL PROGRESS.

Facts About Metals.

Silver will absorb a considerable number of times its own volume of oxygen when highly heated in that gas, or even in common air. This oxygen is not combined with the silver, but is given off at the moment of the solidification of the metal, a circumstance which produces the peculiar frosted or arborescent appearance common to masses of the pure metal. The presence of a small percentage of copper prevents the absorption of oxygen. According to Lampadius and Depretz, silver gives off vapor at very high temperatures. The presence of a small quantity of arsenic greatly increases the ease with which it is volatilized.

Silver alloys readily with nearly all the metals, but their use in the arts is limited to a few employed in the decorative arts and in coinage. Next to copper, it is the most readily deposited on other metals by galvanic action, hence it is used in great quantities for electroplating. Like gold, it was known to the ancients, who used it for coinage and for ornament.

Bismuth melts at about 518° F. It is but slightly oxidized by contact with air; if strongly heated, it burns with a bluish flame; at a high temperature it volatilizes freely. Its principal use in the arts is for the production of the so-called "fusible alloys," above spoken of. These are compounds of lead, tin and bismuth, in varying proportions. Several of these melt below the boiling point of water.

Copper melts at about 2100° F. It is very ductile, malleable and tenacious; at very high temperatures it is slightly volatile; it is unaffected by dry air, but in the damp becomes coated with an adherent green crust. When exposed at a red heat to the air, it is rapidly oxidized, and becomes encrusted by a black scale. At a high temperature copper burns with a green flame. Its uses in the arts and manufactures are too well known to need repetition here. Its principal alloys are brass, bronze and German silver.

Nickel is somewhat less fusible than pure iron; this would put its melting point at about 3000° F. Like iron, it is capable of becoming magnetic, but loses this property at temperatures above 660° F. Though combining readily with oxygen, it is only slightly oxidized when highly heated. Its most important alloy is that with copper, called German silver. Of late it has come into very general use for electroplating miscellaneous objects of every description.

Cadmium melts at about 500° F. It is commonly associated with ores of zinc, and, being a very volatile metal, distills off when zinc ores are roasted.

Manganese has a high melting point, but fuses when exposed to the heat of a good wind furnace. It has a strong attraction for oxygen, and will even take it from water at a low temperature. A variety of bronze containing manganese is highly esteemed.

Iron, intrinsically the most important of the metals, fuses at temperatures dependent on its purity. When containing carbon, or in the condition of cast iron, it melts at 2786° F., but when pure, or in the condition of wrought iron, a temperature of 3280° F. is necessary to melt it. Iron softens before melting, and possesses in a marked degree the property of welding. It has powerful affinities for oxygen, taking it from the air when moist, a circumstance which explains the fact that it is seldom found in a pure or metallic state, except in meteorites. Dry air at ordinary temperatures does not affect it, but when heated to redness it absorbs oxygen and becomes coated with a scale of black oxide. When in a finely divided state, the metal burns while falling through the air; and even in the condition of ordinary filings it burns with brilliant scintillations when thrown into a fire or the flame of an ordinary gaslight.

Tin melts at a temperature of 455° F. It is not acted on to any extent by air or water. When exposed to a temperature somewhat above its melting point, it absorbs oxygen greedily, and is converted into a whitish oxide, known technically as stannous powder. Tin alloys with nearly every known metal. A large proportion of the tin of commerce is consumed in the production of tin plates for roofing, and the production of tin utensils, cans, etc. Other uses are for the production of solders, and it forms one of the constituents of bronze and Britannia metal.

Zinc melts at about 770° F. It undergoes a series of remarkable changes under the influence of heat. At ordinary temperatures it is comparatively brittle; between 250° and 300° F. it is quite malleable, and in this state may be readily rolled or beaten into sheets which have the valuable property of retaining their malleability when cold. The brittleness of the metal at ordinary temperatures is doubtless to be attributed to its crystalline structure, which is probably effaced during the operation of rolling at higher temperatures. At 400° F. zinc becomes so extremely brittle that it may be readily powdered. Zinc is very volatile at a bright red heat, and in the presence of air burns with a bluish-green flame. Brass is the most important alloy. It amalgamates readily with iron, and articles thus coated are known as "galvanized"—a misleading term.

Antimony melts at about 900° F. It is

quite stable in the air, and so brittle that it can be readily pulverized. Its principal use in the arts is for the manufacture of type-metal.

Mercury (or quicksilver) is the only metal (except the exceedingly rare metal, gallium) that is fluid at ordinary temperatures. It boils at 660° F. It amalgamates freely with gold, silver, copper, zinc and tin, but only sparingly with iron. Its chief uses are for coating mirrors, in the manufacture of barometers and thermometers, and in amalgamating with gold in the production of that metal.—*Boston Journal of Commerce.*

Recent Advances in the Metallurgy of Iron

The metallurgists, evidently, have yet much to learn in understanding the influence of other elements in modifying the properties of iron and steel. In respect of its extreme sensitiveness to the presence of the smallest appreciable quantities of foreign substances, iron seems to stand alone, and the possibilities which this fact opens to investigators are almost limitless.

The peculiar effects of carbon, silicon, sulphur and phosphorus on the physical properties of iron have long been known, and play an important role in its utilization. It has only lately come to light, however, that aluminium, in so small a quantity as the one tenth of one per cent (that is, one part in 1000), renders wrought iron and steel distinctly more fusible.

More recently, the observation has been made that additions of this element to cast iron, in quantities from one-fourth of one per cent up to one per cent, produced most favorable effects, rendering inferior irons soft, and fitting them for foundry uses.

Now manganese is coming to the front as a useful addition to irons and steels, and from various sources we learn that it promises to yield results quite as valuable as those obtained with aluminium. In a paper recently presented to the Iron and Steel Institute by R. A. Hatfield of Sheffield, England, he claims to have obtained in experiments in making steel with a high percentage of manganese, "results which are entirely novel, and appear to show the way to an absolutely new sort of metal for various purposes."

His experiments were made with the idea that steel with high manganese might give a hard material, but without the brittleness of spiegeleisen, seeing that the carbon would be much reduced. The results obtained show some novel features, which it will be of interest to briefly summarize.

"After many trials a material was produced combining great strength with hardness, but the puzzling and apparently paradoxical result was discovered that, although steel, if it may be so termed, with 4 to 6 per cent of manganese, and less than $\frac{1}{2}$ per cent of carbon, was so brittle that it could be powdered under a hand-hammer, yet by adding twice this amount of manganese, just the contrary effect was produced, and a material was obtained containing many apparently new properties, as compared with any iron or steel hitherto manufactured. Briefly, the material may be described as follows: That containing from 2 $\frac{1}{2}$ to 6 per cent is extremely brittle in its cast state, then a return in strength gradually takes place, and, with about 9 to 10 per cent, a cast bar, 2 $\frac{1}{2}$ inches square, can be bent considerably out of the straight without breaking. This continues up to about 14 or 15 per cent, when a decrease occurs in actual toughness, though not in transverse strength, and after about 20 per cent is passed, then a rapid decrease again takes place. It should be stated that these remarks apply specially to the material in its cast state.

"Manganese steel is not so liable to honeycombs as ordinary steel and the addition of silicon is unnecessary. It is very fluid and can be run into thin sections, but cools more rapidly than ordinary steel, and its contraction is decidedly greater. The latter fact explains the reason of its piping and settling so much, both in the ingots and in castings; with proper heads or runners, however, this difficulty can be obviated. It is manufactured by any of the ordinary steel-making processes, the basis, i. e., the material before the manganese is added being preferably decarbonized iron (practically pure iron, Fe), or mild steel. The ferro-manganese is added in a molten state or very highly heated. The steel is then ready for casting into ingots or other forms."—*Manufacturer and Builder.*

A NEW CEMENT.—At the last meeting of the Academy of Sciences in this city, an interesting paper was read by F. Gutzkow on magnesium oxychloride, or white cement. A number of specimens were presented for the inspection of the members. One of the principal advantages of the new cement is that it can be manufactured in California. It is composed of one-half magnesium oxide, which is obtained from the magnesite deposits in the Coast Range, and one-half magnesium chloride, obtained from the various sea-salt manufactories throughout the State. It may be used for sidewalks, interior decorating, and in appearance resembles pure white marble. It has a natural polish, and above all is much cheaper than any of the other substances now in use. W. R. Bently read a paper descriptive of the great glaciers of the Selkirk, in which the speaker, assisted by a colored sketch of the principal glacier, gave an interesting and vivid description of the beautiful scenery of the Columbia river.

SCIENTIFIC PROGRESS.

The Paradoxes of Science.

The water which drowns us, a fluent stream, can be walked upon as ice.

The bullet, which, when fired from a musket, carries death, will be harmless if ground to dust before being fired.

The crystallized part of the oil of roses, so grateful in its fragrance—a solid at ordinary temperatures, though readily volatile—is a compound substance, containing exactly the same elements, and in exactly the same proportions, as the gas with which we light our streets.

The tea which we daily drink, with benefit and pleasure, produces palpitations, nervous trembling, and even paralysis, if taken in excess; yet the peculiar organic agent called theine, to which tea owes its qualities, may be taken by itself (as theine, not as tea) without any appreciable effect.

The water which will allay our burning thirst augments it when congealed into snow, so that it is stated by explorers of the Arctic regions that the natives "prefer enduring the utmost extremity of thirst rather than attempt to remove it by eating snow." Yet if the snow be melted it becomes drinkable water. Nevertheless, although if melted before entering the mouth it assuages thirst like other water, when melted in the mouth it has the opposite effect.

To render this paradox more striking, we have only to remember that ice, which melts more slowly in the mouth, is very efficient in allaying thirst.

A CURIOUS LITTLE DISCOVERY.—A correspondent of the *Electrical Review* says: "I have made a curious little discovery, which may interest your readers. It first occurred on a railway train. I happened to hold against the inside surface of the window-glass a daily paper which had been cut by a saw tooth cutter, leaving a ragged edge on which some of the bits were loose. When I removed the newspaper, some of the bits remained clinging to the glass. It was curious, and I began to investigate with larger pieces. All would stick to the glass when laid against it. I took different kinds of paper then, but the results were the same. Since then I have repeated the experiment a great number of times on different railways, and always found the glass apparently electrified. It cannot be capillary attraction, as the most porous kind of paper, if light, will stick just the same. I have had pieces of newspaper two inches square hold firmly. And a strange thing, too, the phenomenon appears as certainly in rainy weather, even when the window-panes are streaming outside. It seems to require a clean window for good results. One evening I tested seven windows in one car, and had them all spotted with bits of paper, and my fellow-travelers eyed me with suspicion as a result. Now, why does the paper stick? Is it the friction of the air outside? Hardly, because, after a five-minute stop, fresh paper will stick just as effectually. Is it due to the heat of the finger in applying the paper? No, because a lead pencil or a cork will do instead of the finger. Is it capillary attraction? I think not. I will be glad to have some of your readers investigate and report. Perhaps a pocket electroscope would help."

PHOTOGRAPHING THE SUN OR MOON.—Mr. J. C. O'Loan of Liverpool writes to the *Scientific American* as follows: "While experimenting with a ray of sunlight in a darkened room, I had my attention directed to pinhole pictures, and am of the opinion that startling results can be obtained in photographs of the sun or moon in this way. In a room darkened by blocking up windows with thick paper, make a small hole in the paper with a darning needle, so as to admit a ray of direct sunlight. Hold a piece of paper in the path of the ray, 12 in. from the hole, you will have an image of the sun $\frac{1}{2}$ in. in diameter, at 4 ft. an image of 1 $\frac{1}{2}$ in., and so on. The size of opening used as lens does not alter the size of image at any given distance, but only its sharpness. Say the opening is 1.16 in., and gives a sharp picture at 4 ft., by enlarging the opening to one-eighth, the size of the image at 4 ft. would be still the same, but unsharp, so that the screen or plate must be removed to twice the distance to obtain equal sharpness. In a room 100 ft. long, a 12-in. picture of the sun could be had, and of the moon one very much larger. A series of pipes 100 yards long for camera would give a 3-ft. photograph of the sun. In fact, there is no limit to size of image but the length of camera. Perhaps some one who has more time and space at his disposal than I have may take the subject up."

ARGENTINE.—"Argentine," says *Iron*, is a name given to tin precipitated by galvanic action from its solution. This material is usually obtained by immersing plates of zinc in a solution of tin containing about 90 grains of the metal to the quart. In this way tin scrap can be utilized. To apply the argentine, according to H. P. Marino's process, a bath is prepared from argentine and acid tartrate of potash, rendered insoluble by boric acid. Pyro phosphate of soda, chloride of ammonium, or caustic soda may be substituted for the acid tartrate. The bath being prepared, the objects to be coated are plunged therein, first having been suitably pickled and scoured, and then sub-

jected to the action of an electric current. But a simple immersion is enough. The bath for this must be brought to ebullition, and objects of copper or brass, or coated therewith, may be immersed in it.

THE GREAT ERUPTION AT KRAKATOA.—A report made to the Dutch Indian Government on the character of the memorable volcanic outbreak in the Sunda straits, estimates that the amount of ejected matter from Krakatoa must have been at least ten cubic miles, or to make a range of hills about 1000 feet higher than the surrounding plain. The velocity of ejection was considerably greater than that of the heaviest rifled ordnance, and the ejected material must have reached a height of 30 miles, or six times the height of the highest mountain in the world. The noise of the explosion was heard over one-fourteenth of the earth's surface, and a great atmospheric wave, starting from Krakatoa as its center, spread itself around the world, describing the whole circumference in some 36 hours.

AN ELECTRIC ACTINOMETER.—Messrs. Gony and Rigollet have devised a small battery of peculiar construction that may, according to the *British Journal of Photography*, be used as an actinometer. It is made by heating a clean plate of copper over a Bunsen burner till a layer of cuprous oxide forms; this plate, with one of unaltered copper, forms the battery. A galvanometer is introduced into the circuit and the battery then exposed. The effect is instantaneous, and disappears when the light is cut off. Diffused daylight produces an alteration of several hundredths of a volt, direct sunlight an alteration of at least a tenth of a volt. It is stated that with a Thompson galvanometer it is possible to recognize the effect of a candle flame at a distance of several yards.

A NEW METHOD OF PREPARING SILICON.—H. W. Warren suspends small bars of ferro-silicon immersed in dilute sulphuric acid from the positive pole of a battery, and resting upon a platinum plate that forms the negative pole. After solution of the iron, the residue consists of graphite, silica and amorphous silicon; this residue is heated to redness in carbon dioxide, and then to bright redness in a closed iron tube with zinc. The silicon is dissolved by the zinc, and is obtained in crystals when the zinc is treated with hydrochloric acid. If aluminium be used instead of zinc, and the temperature raised to whiteness, graphitoid silicon is obtained.

HOW IT WAS SETTLED.—The question as to whether the upper part of the wheel of a vehicle in motion travels faster than the lower part has been settled by instantaneous photography, in experiments made by S. W. Gardner. Mr. Gardner takes the photograph of an omnibus en route, and in this photograph, while the lower ends of the spokes immediately adjacent to the ground are not perceptibly unsharp by the motion, the tops of the upper spokes show an angular motion corresponding to about 10 degrees. The photograph most successfully expresses the fact that the wheel it represents is in rapid motion.—*Exchange.*

AN INTERESTING FACT.—A boat may be pierced in several places below the water line, and yet continue to float indefinitely, so long as a swift motion through the water is kept up. This was recently proven by an interesting experiment tried by the English builders, Thornycroft & Co., with a new boat. For the purpose of making the experiment a three-quarter-inch hole was bored into the side, about one foot under water. When the boat was at rest the water flowed in very rapidly, but when moving at a speed of about ten miles an hour a skin of water was drawn over the hole, which resisted any inflow.

A NEW LAMP FOR SHIPS.—A Perthshire inventive genius has produced a new lamp. It is a cross between a candle and a paraffine lamp, but it has all the advantages and none of the defects of either. There is no fear of explosion or of flooding the place with oil (in case of breakage), and there is no waste. The way the wax is kept liquid round the wick is so ingenious that it has been patented, and a company has bought it. It is having a great sale among ship-owners, to whom its qualities are especially valuable.

AN ELECTRO-MAGNETIC PIANO.—Dr. Eisenmann of Berlin has invented a piano which, by the aid of electro-magnetism, can sustain, increase and diminish sound. This has been attempted by other experts, notably Boehm, the inventor of the metal flute. Another novelty will be that, by moving the electro-magnets, the timbre of the tone is changed; for example, from that of a violoncello to piccolo.

TO FIX PENCIL DRAWINGS.—First pass the drawing through clear water, go carefully over with skimmed milk, using a camel's-hair pencil, dip in a weak solution of alum, and let it dry flat. Allow a thin solution of isinglass to run over the drawing on perfectly level surface.

ONYX.—The Mexican marble, which we know as Mexican onyx, is not onyx at all. Onyx is an agate consisting of parallel layers of chalcedony. Marble is a carbonate of lime.

THE SHELLS of all crustacea get red when boiled; those from salt water more than those from fresh. The result is the same, whether the animal is in the shell or not.

USEFUL INFORMATION.

A Lake of Volcanic Glass.

At a point in New Mexico, about 100 miles north of El Paso, there is a lake of molten, black volcanic glass, which seems to have been agitated at the moment of cooling into ragged waves of fantastic shapes. These lava waves or ridges are from 10 to 12 feet high with combing crests. This lava flow is about 40 miles long from northeast to southwest, and from 1 to 10 miles wide. For miles on all sides the country is the most desolate that can be imagined. It has been literally burnt up. It consists of fine white ashes to any depth which, so far, has been dug down.

Ruins of an Ancient City.

A few miles to the north of this lake, or lava overflow, and lying in a country equally desolate and arid, are found the ruins of what was evidently once a great city, now known as the ruins of Gran Quivira. These ruins were well known to the early Spanish explorers, but in later times have been visited by white men less often than the mysterious ruins of Palenque, in Central America. Only a few people at Socorro and White Oaks have been at Gran Quivira, because it is at present 40 miles from water. The ruins consist of gigantic stone buildings built in the most substantial manner, and of grand proportions. One of them was four acres in extent. All indications around the ruins point to the existence here at one time of a dense population. No legend of any kind exists as to how this great city was destroyed, or when it was abandoned. One of the engineers attached to the surveying expedition advances the theory that Gran Quivira was in existence and abundantly supplied with water at the time the terrible volcanic eruption took place which led to its destruction.

A TRADE IN DOGSKINS.—It is well known that in many districts of Manchuria and China there is a great trade in dog and goat skins, which are employed in the manufacture of robes and mats; but it is commonly supposed that the skins are remnants of dirty and filthy animals which abound in those quarters. The idea, however, is a mistake, for the business of rearing dogs for this purpose is as well established and is as systematic an industry as sheep farming. There are countless dog farms scattered over the unknown regions of Manchuria and Mongolia, where from 20 to 100 dogs are reared every year, and where the inhabitant is esteemed according to the number of dogskins in his possession. It is probable that the most beautiful dogs are to be found in these countries, for the exceedingly low temperature of winter, where the thermometer falls to 30° F. below zero, produces a magnificent coat and skin. The prices obtained are, however, very unprofitable, a full-sized robe 80 inches square containing the skins of eight animals, being quoted at 14s. 6d. The value of the trade from Newchwang last year is stated at £40,000.

HORSES ON SNOWSHOES.—Snowshoes have been worn for years by horses on the Orville & Quincy mail route during the winter months. It would be impossible for them to travel over the deep snow without their aid. A horse that is accustomed to wearing them will travel five and six miles an hour, where it would be impossible to go that distance in a week without them. The shoes are made of thin steel plate, about 9x11 inches, fastened on the hoofs with clamps. The horses are shod with long heel calks which go through the snowshoes, and prevent their slipping going up and down hill.

CLEANING ZINC.—The following is recommended by an English writer for cleaning zinc: Clean off all old paint, and apply the following mixture: In 60 parts of water dissolve one part chloride of copper, one part nitrate of copper, one part cal-ammoniac, and one part hydrochloric acid. Rub the zinc over with this, which gives it a deep black; leave it to dry until next day, and it is then ready for painting. The heat paint to use is Becket's prepared varnish paint, which cannot be surpassed for tenacity and durability.

VULCANIZED FIBER FOR COGS.—Vulcanized fiber for mechanical purposes has for some time attracted attention. As a material for cogs, where the moisture from ordinary gearing is inconvenient, it has, according to all accounts, given very satisfactory results. In one case gutta-percha cogs are known to have been used for 20 years. When the wheels became worn, the material was utilized for casting fresh ones. The fact that cogs made of this material are almost noiseless, adds materially to their value.

STOUT CAR HORSES.—Fifteen miles a day is the average distance traveled by each horse of the Dry Dock railway, Philadelphia, and the average working life of the horses is about five years. The horses weigh from 1000 to 1200 pounds. The heavier horses are driven on the one-horse care, and it is found that the horses working singly, as a rule, last longer than those in double teams. They are not as likely to be fretted and annoyed by being cramped as the team horses are.

THE WAY TO GET RID OF TATTOO MARKS.—M. Varinot gives a method of getting rid of tat-

too marks, which causes but little pain and leaves no deformity. He simply punctures the skin over the mark with fine needles, and introduces a little tannin, and then touches the parts with a strong solution of nitrate of silver; this forms a tannate of silver scab that falls off soon and the mark goes away with it.

OUR RICE PRODUCTION.—Before the war we exported over 20 per cent of our rice crop; to-day we have to import rice from China. In 1885 the crop in this country was 150,000,000 pounds. The Carolinas, Georgia and Louisiana raise nearly all our rice along the lowlands about the rivers. The yearly consumption per capita in this country is four pounds. England's people eat 10½ pounds each per year.

THE BELL CORD DOOMED.—On all Pennsylvania line trains, unless it is one of the small branches, the bell-cord is gone, and instead of it the air-brake pipes are used to blow a whistle in the locomotive cab. The slightest touch of a delicate wire leading to a valve in the brake system blows the whistle. The Vandalia, as well, has adopted it on most of its trains.

SACCHARINE AND INSECTS.—Dr. Worms of the Paris Academy of Medicine has ascertained that bees, ants and wasps show a marked dislike to the new saccharine. To the human palate there is no difference in the taste between it and sugar. It has been shown, however, that its use disturbs digestion.

WARMING CARS.—The *Railroad Gazette* mentions 24 railroad companies that have definitely adopted some system of heating their cars by steam from the locomotive, and these companies have 2500 cars thus equipped. This is an encouraging sign that the days of the car stove are numbered.

A NEW CARPENTER RULE has been invented by a Boston mechanic. It is of novel construction, and aside from its uses as a rule makes a very handy level or square, in which legs may be adjustably clamped in any desired position.

A PASTE that will harden quickly, stand a great amount of heat and is steam-tight, when hardened is made of asbestos powder stirred into a thick paste with the liquid silicate of soda.

THE managers of a Pittsburg street-car line posted the following placard in their cars: "Whoever expectorates in this car cannot expect to rate as a gentleman."

ROPE TRACES are coming very generally into use for street cars. They are cheap and easily made, and last something over a year.

GOOD HEALTH.

Health of the State.

We have received the monthly circular of the State Board of Health for November. Returns have been received from 63 localities having an estimated population of 654,000. The mortality in those localities during the month was 997—an annual death rate of 18 per thousand, which is above the average for the past six months, but still a very low rate of mortality. Consumption caused 142 deaths. Pneumonia, which in October produced deaths in but 47 cases, in November caused the decrease of 108, or over double the number of the previous month. Congestion of the lungs caused ten deaths. Cholera infantum fell from 30 deaths in October to 12 in November, all of which were sporadic cases. Diphtheria showed an increase, 43 deaths being ascribed to it. Twenty-two of these occurred in San Francisco, six in Los Angeles, and three in Napa, the remainder being scattered throughout the State. Deaths from other diseases were as follows: Croup ten, whooping-cough seven, scarlet fever two, smallpox one, typhoid malarial fever nine, erysipelas three, heart disease six, yone, alcoholism ten. The deaths from cancer reached the very large aggregate of twenty four.

The reports from the different localities show that there was an increase in diphtheria and typhoid fever and a tendency to the spread of smallpox. The meteorological changes during November have increased all acute diseases of the respiratory organs, influenza being epidemic in many places, and pneumonia and bronchitis being quite prevalent.

Referring to deaths from croup and its "twin-sister," diphtheria, the circular says: "The increase in the reports of these diseases must be attributed to sanitary carelessness in the management of the cases occurring. When once diphtheria has arisen, the law of contagion carries it to the rich and the poor without discrimination; to the cleanly and the uncleanly, but not to all alike. Filth fosters the disease, but cleanliness offers no inducement for its propagation. Beware of any person who has a sore throat; do not kiss or absorb the breath of any such. Do not visit the dwelling where diphtheria or croup is present, and above all, do not let your children go where it is. Diphtheria is a preventable disease, and proper sanitary and preventive measures are invariably followed by a limitation of the disorder to the place of its occurrence."

The increase of cases of typhoid fever is attributed to the first rains which always wash

more or less surface impurities into drinking-water. The same cause added to the cold fogs of the season have added much to the frequency of pneumonia. The avoiding of exposure, sanitary care and vigilance are the only means known for preventing these diseases.

ANTI-HYDROPHOBIA.—A Mexican paper says that in the village of Tlaoyapan of Morelos, district of Yautepec, grows a shrub known by the name of Margarita, the mastication of the leaves of which has been discovered to be a radical and instantaneous cure for the hydrophobia. A young woman, named Margarita, was attacked by rabies, made use by chance and for the first time of said leaves, and in her we witnessed this discovery. Afterward there was cured in the same manner her sister, a native of the same town; a daughter of the chief of the hacienda Tenextepango; an individual of Tetxcala, State of Morelos, etc. It would be convenient to make the analysis of this plant that presents such valuable services to humanity and which has been known in many places in Mexico before and since 1870.—*Diario de Centro America.*

[NOTE.—S. H. Gerrish, who translated the above from the Spanish, suggests the query whether the shrub referred to is not the flowering plant of the same which is so common in the gardens of California. If so, it would acquire an almost priceless value. *Quien sabe?*—EDS. RECORD UNION.]

PREVENTION OF SCARLET FEVER.—Sulphur is recommended as a preventive of scarlet fever. I think it might be useful, but the standard specific for that purpose is belladonna in some form, allopathic or homeopathic. The latter form is easier to manage with children, as it can be given in sugar pills. Belladonna fulfills three purposes. It is a preventive. In a case where the attack of fever is inevitable and cannot be prevented, it is then a preparative and palliative, mitigating the severity and danger of the attack when it comes. It is also a specific remedy for the disease. As soon as it is suspected that a child has been exposed to scarlet fever, four or six belladonna sugar pills, such as are used for homeopathic medicines, should be given morning and evening until the time is passed when the disease should have appeared. If one prefers allopathic treatment, let him not fail to obtain directions from a physician as to the dose to be given. The remedy should not be used carelessly and unadvisedly, but it is the specific for scarlet fever, whether the object sought is prevention, mitigation, cure or avoidance of unfortunate after-effects, such as affections of the ear or eye.—*J. P. Robinson.*

ELECTRICITY FOR YELLOW FEVER.—A Kentucky physician suggests the following cure for yellow fever, claiming that the poison in the air is so delicate and subtle that it can be dissipated by strong light: "If this is a fact," says the doctor in a communication to Surgeon-General Hamilton, "I am of the opinion that if a row of large army tents were spread along the center of some street in Jacksonville for the inhabitants to take refuge in, after having been thoroughly disinfected, with a sufficient number of electric lights arranged near the ground on either side of them (the wires, of course, being well grounded), that the lights could be made so intense as to repress the poison and stay the destroyer."

OIL OF BAY VS. FLIES.—It is stated that expressed oil of bay (*huile de laurier*) is extensively used in Switzerland by butchers to keep their shops free from flies, and that after a coat of oil has been applied to the walls none of these troublesome pests venture to put in an appearance. This remedy has also been tried and found effectual in the south of France in preserving gilt frames, chandeliers, etc., from becoming soiled. It is even remarked that flies soon avoid the rooms where this application has been employed.—*American Druggist.*

WATER AND OBESITY.—A physician of Erlangen, Dr. Lorenzen, experimented with himself for the purpose of seeing the effects of imbibition of water upon the bodily weight. For four years he indulged in the not ascetic task of drinking two gallons of beer daily, and discovered the remarkable fact that he had increased his weight 78 pounds. On stopping the ingestion of water (beer) he reduced his weight 14 pounds in seven days. Dr. Lorenzen's experiments are being performed daily by a large class of our esteemed Teutonic citizens.—*Medical Record.*

ONE PROBABLE CAUSE OF LEFT HANDEDNESS. A French physician, Dr. Felz, mentions a curious apparent cause of left-handedness. A child in a certain family was left-handed, and the second appeared to be so at the age of one year. It was then learned that the mother always carried her children on her left arm. She was advised to change, and, held on her other arm, the infant, having its right hand free to grasp objects, soon became right-handed.

TOBACCO SMOKE AND DISEASE GERMS.—Dr. Vincenzo Tassinari of Pisa has been making experiments to ascertain whether tobacco smoke exerts any influence on the development of disease germs. He is stated to have found that certain bacilli are retarded three or four days when exposed to the smoke of the cigar, while the germs of cholera and typhus are entirely destroyed by it.

ENGINEERING NOTES.

De Lesseps Still on the Ragged Edge.

The telegraph a few days ago reported that an American syndicate had been formed to take the work of the Panama canal off the hands of De Lesseps and complete it at once with American capital.

Directly upon the heels of that rumor, and, no doubt, actuated by it, came a report that the French Government would step in and do the work.

That rumor had scarcely been called when word came over the wires that a scene of great excitement had just been enacted at the office of the company in Paris. De Lesseps suddenly appeared at the office and, mounting a table, exultingly said: "My friends, the subscription is safe. Our adversaries are confounded. You have saved yourselves by your own exertions. The canal is made." Here De Lesseps was so much overcome that he burst into tears. Amid cheering and weeping all present shook hands with the famous engineer and congratulated him on his triumph. He had been informed that 410,000 bonds had been taken by the people of Paris and about as many more outside the city—making a total of 800,000.

Then again, the very next day, Dec. 13th, came the news that the bright hopes of the day before had vanished, and all was again in the dark. Another exciting meeting had been held at the company's office, at which, on a call for De Lesseps, his son appeared and announced that only 180,000 bonds in all had been subscribed for, and that the company would, therefore, begin returning the deposits the next day. Referring to his father's remark of the previous day, he said: "My father is younger in spirit than I am. His remarks were made on the strength of a hopeful report that I made him. The result is bankruptcy or the winding up of the company." He urged them to petition the Government to come to the assistance of the company.

Such is the condition of this great enterprise as we write. What a day may bring forth in this curiously developing work no man can tell.

In regard to the last resort proposed—a petition to the French Government to come to the assistance of the enterprise—a contemporary remarks as follows:

When De Lesseps organized his French company he was informed of the points of what we Americans call the Monroe doctrine. In other words, he was told that so long as his company remained strictly a private company, asking no special favors of the French Government and incurring no obligation which would warrant that Government in assuming a protectorate over the canal, there would be no obstacle offered to his enterprise from this quarter. But he was also informed that the United States would not permit a European power to exercise ordinary Government powers over the canal.

The affairs of the canal have reached the crisis that was at that time looked forward to. The canal has absorbed three times the amount of money it was estimated to cost, and is not yet half finished. It has been pretty certain for a year that M. De Lesseps could not get the required sum for its completion from private sources. He was reduced to the alternative of handing the work over to the Government, or of borrowing money on the credit of the Government to an extent which would warrant the Government in assuming control of the canal. The difficulty in the way of either course is that both are in conflict with the assurance M. De Lesseps made to our Government when he organized his company. Large as the expenditures of the De Lesseps Company are, they are insignificant in comparison with the interests involved in the maintenance of the Monroe doctrine. M. De Lesseps has learned that the Monroe doctrine was in force and that his operations must be kept within its requirements. The individual of average wisdom is reluctant to hny into a lawsuit, so we may assume that a Government will exercise a like precaution in huying into a war. The American people have the most kindly feeling for the French, but they cannot waive the Monroe doctrine on sentimental considerations.

THE SWEDEN-DENMARK TUNNEL.—The fate of the railway tunnel between Denmark and Sweden has practically been decided, the joint Swedish-Danish Commission appointed to report upon the project having recommended its rejection, at all events in its present form. The proposal for a tunnel was made by a syndicate of French financiers, and provided for a railway tunnel from a point in the island of Amager, near Copenhagen, to a point near Malmo, on the Swedish coast, the applicants for the concession maintaining that such a connecting link between the railway systems of Denmark and Sweden could not fail to develop the traffic between the two countries.

SETTLEMENT OF BRIDGE PIERS.—A curious case of the settlement of the pier of a bridge is reported from Knin in Austria, where the abutments of the Orzavica bridge have sunk a depth of 20 feet in the river-bed since 1886. As the settlement progressed, the masonry of the bridge was built up correspondingly so as to maintain the same road level. The settlement has now entirely ceased and no further trouble is anticipated.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

AMADOR GOLD MINE.—*Ledger*, Dec. 8: This company's mine is about 1½ miles south of Jackson on the Mother Lode of gold quartz, on which many of the best mines in the State are located. The mill is about half a mile down Hunt's gulch below the mine. The county surveyor is now at work locating the route for a tramway to connect mill with mine. Shaft No. 1 is 280 feet deep, shaft No. 2, 91 feet deep, shaft No. 3, 328 feet deep, south drift connecting shaft No. 1 and 3 is 380 feet; west crosscut from shaft 1, 458 feet; east crosscut, 9 feet; north drift from east crosscut is in 99 feet; south drift on west ledge crosscut is in 51 feet; south drift at shaft No. 3, 37 feet, west crosscut from shaft 3, 152 feet; north drift on west ledge from west crosscut 3 feet; upraise from west crosscut up 73 feet, intending to connect with bottom of shaft No. 2. A large ore bin is cut out at shaft 3 on the 250-foot station, and preparations generally throughout the mine are being made to take out ore to keep 60 stamps pounding away. A fine air-compressor of the National pattern runs four drills in different parts of the mine. The machinery is all run by water-power from the Amador canal, under a pressure of 165 feet. The mill will also be run by water-power from the same canal, but under 300 feet head or pressure. Mill will be supplied with the Gates ore crusher No. 5, or with two No. 3's. J. B. White & Co., the mill builders, say the mill will work 4 to 4½ tons of ore per stamp each day. The mill will have 24 Frue concentrators, which are considered best for this kind of ore. The mill is well under way, the building and batteries all up, and nearly all the heavy machinery on the ground ready to go in. The building is 108 feet long, 90 odd feet wide, and the high including ore crusher is 88 feet, and is of the most substantial character. The superintendent says he can deliver the ore from the mine to the mill for 5 cents a ton. The company is now getting up large hoisting and pumping machinery to put on shaft No. 3, when the present works on shaft 3 will be taken to shaft 2. The Pelton water-wheels are the kind used by the company.

NORTH STAR.—*Ledger*, Dec. 15: This property is reported as looking more encouraging than ever. The rich seam was broken into a few days ago, and the rock extracted proved fully as rich as any heretofore taken out. A most promising feature is that black gouge is met with. This has until lately been entirely wanting, and the fact that it now begins to make its appearance is accepted as additional evidence that the ore-body will eventually open out to a large and permanent ledge. It has been decided upon to sink another 100 feet and see how the ore-body appears at that depth.

GRAINGER.—Preparations are being made at this mine near Pine Grove to stope out 100 tons or more for crushing. The shaft is now 80 feet deep and a level has been run on the ledge 50 feet, proving the ore to be apparently of as good quality as that which was milled last summer. The vein is from a few inches in width to two feet, and is not frozen to the walls. The gold is distributed very evenly through the ledge, and occasionally pieces of quartz are found showing the free metal. The first crushing yielded at the rate of \$27 per ton, and some was put through an arastra. All the quartz so treated came from the shaft when it had reached 40 feet in depth, and the total product was \$522. At the Tripp and Littlefield mine above Big Bar Bridge the carpenters have the building about finished. The mortar blocks are in and the machinery on the ground ready to be put together. The mill will be very complete, excepting concentrators, as the management has decided not to put in any at present. The power will be furnished by the river water falling over a turbine wheel. Ginocchio Bros. have started up their mill at the Valparaiso. There was a large pile of concentrated sands from ore crushed last spring and when the mill is not running these sands are treated on two Frue machines for the sulphurets they contain. So far there are about 15 tons saved. They have a quantity of picked metal, much richer than that ordinarily milled. After the heavy gold is extracted the tailings will be run into a tank and allowed to settle. It is then ready to sack up for the furnace. We are informed that within the last few weeks 56 pounds of quartz was taken out of the Keystone, from which \$5000 in gold was obtained. The McKenzie Bros. are setting up two Frue concentrators at their mine at Irish-town, and will start the mill as soon as they can get water. There is a streak of sulphuret ore in the mine, said to assay well. A Frenchman named Sellier has allowed a bond on the Dane mine and mill near Pine Grove to lapse, where some prospecting was done during the summer. The property belongs to L. Cassinelli & Bro. of Volcano. Col. W. T. Robinson is plodding along with his scheme to incorporate and work the Alpi gold mine on the same claim as the North Star. His subscription list shows 48,000 shares spoken for, out of a total of 100,000.

Calaveras.

THE GOLDEN EAGLE.—*County Record*, Dec. 13: The Golden Eagle, situated two miles from Angels, in the famous Albany Flat district, bids fair to become a mine of no mean importance. The proprietors, Swartz & Gergens, are jubilant over the fine developments that have rewarded their labors. The shaft is only 50 feet in depth, showing a magnificent ledge 12 feet in width. The rock is very rich in sulphurets and carries free gold. Mining experts claim that the character of the rock at the present indicates a promising mine.

WILLIAMS RANCH.—The mines in and in proximity to Williams Ranch are receiving the attention of prospectors. That is a pocket region. Some rich and beautiful specimens have been taken out from time to time in that locality. A company working on the May Flower, two miles west of Murphy's, are so pleased with the developments that they have gone to San Francisco to make arrangements to place an engine on their claim for pumping and hoisting.

Fresno.

COARSE-GOLD GULCH.—*Cor. Fresno Expositor*, Dec. 6: On the North Side are situated the Lang

& McClellan groups of mines, composed of the Hawkeye, Laura May and the Burney. The first two named are bullion-producers; about 1500 tons from the first and 300 from the second have been milled. The five-stamp mill through which the ore was put had no facilities for saving the sulphurets, and nothing but the free gold was saved, and although this left a handsome profit it was deemed too wasteful, as the sulphurets were increasing as depth was attained. It was then determined to fully develop the several mines, so as to ascertain the capacity and kind of machinery required in a new mill for saving the gold. A shaft was then sunk on the Burney, a location made north of the Texas Flat mine, and on the same lode following this vein, and in ore all the way to a depth of 160 feet, at which point considerable water was encountered, which prevented their crosscutting to the hanging-wall for the purpose of ascertaining the width of the ore body. Good assays in gold were obtained throughout, some of them going over \$700 per ton, but being almost exclusively sulphuret ore. This was so encouraging that the owners, in connection with Charles Melville, on the same vein or lode, 1500 feet further north (the ground between being owned by P. B. Donahoe), have within the last 12 months run a tunnel on this along the foot-wall of the ledge over 500 feet, at which point they ran a cut across the ore body and found it 70 feet in width. Samples have been taken from all portions of the cut, and gold is found in all of it. The very lowest assay obtained went \$2.50 per ton and the highest \$200. The ore is similar in appearance to the Burney. They have since extended the tunnel 40 feet further along the edge of the ore body, the quartz or ore improving, and no symptoms of diminution in quantity. This mine is called the County View, and when properly equipped with milling facilities will be the most important in this portion of the State. Belonging to this series of mines is the Texas Flat, owned by Haggin & Hearst, aggregating some 6000 feet, upon which has been sunk a shaft 500 feet in depth, and a 1000-foot tunnel has been run, developing a vein of quartz varying in width from three feet to thirteen, with sulphureted ores of the same character as the Burney and County View. Preparations to build a mill for this property have been begun and a portion of the lumber brought to the site. Another promising prospect adjacent to the Lang group is owned by J. S. Lingo; vein from two to six feet in width; paying by milling process \$20 per ton in free gold; carries a high per cent of sulphurets which assay into the thousands. On the north of this is situated the Nob Hill, discovered by Charles Ward some 18 months since, and now owned by White & Co. The ore from this is very rich. They have been working steadily. The Lady Ellen is an old location, and has been mined along its surface at intervals for the past 20 years. The ore has been worked by both mills and arastras, and has made an average of \$12 per ton in free gold. None of the sulphurets have been saved. The vein is from three to four feet in width, with deepest workings only 40 feet. And last, but not least, is the Flying Dutchman, owned by Samuel Giles and John Krohn, on the bluff overlooking the Fresno river, at an elevation of about 600 feet above it. A shaft has been sunk 100 feet and a level run from the bottom of it 100 feet, developing a five-foot vein of heavily sulphureted ore, samples of which gave from \$2.50 to \$70 per ton in free gold, the sulphurets assaying over \$150 per ton. The Last Chance, owned by McKenzie & Rule, about four miles southeast of John Krohn's hotel, is equipped with a good ten-stamp mill, and lately they have added to it two Frue concentrators. But it needs two more to do the work required. It has been a steady bullion-producer for the last five years. The mill is now steadily running on ore that will average over \$30 per ton, and they have enough of that kind uncovered to keep them going several months yet.

Mariposa.

WHITLOCKS AND SHERLOCKS.—*Mariposa Gazette*, Dec. 15: On Sunday last we visited the Whitlock and Sherlocks country, and saw a few of the mines of that vicinity. The little two-stamp mill of Ellingham & Groves was pounding away vigorously crushing beautiful looking rock from the mine of the Helm Brothers. Judging from the samples we saw from this mine, it is certainly a rich one. This little mill is of great benefit to the different mines of that region, and has, we understand, ground out over 200,000 in the few months it has been planted there. That entire section abounds in rich veins and good placer claims, and more mills would be kept busy could plenty of water always be had. We visited Capt. Diltz mine and saw the preparations he was making for winter, making and repairing flumes, and putting things in order. Lack of water alone prevents him from uncovering the wonderful strata which form the entire mountain on which his mine is situated.

MARIPOSA ESTATE.—James Cross, superintendent of the Mariposa estate, was in Mariposa on Thursday last. He speaks encouragingly of the prospects at the Pine Tree mine. They have a vein now in the face of the north drift, seven feet in thickness, which shows free gold and yields satisfactory prospects. Mr. Cross has no hesitation in saying that it is the purpose of the owners to fence the entire grant.

GRANITE SPRINGS.—Report has it that Messrs. Barfield, McSwain & Varain are taking out very rich rock from their recent purchase here. The Mignonne mine and mill are running a full crew of hands, under the superintendence of Mr. Larkin of Snelling. This mill has been idle for some time for want of water to run it.

POCKET.—It is rumored that Mr. Samuel Carr of Hornitos struck a rich pocket in his mine a few days ago.

Napa.

MINING NEAR CALISTOGA.—Work in the Palisade mine and reduction works continues right along, and shipments of bullion are regularly made. Everything is running smoothly at the works, and ore is being taken from the mine as fast as needed for the stamps. For this purpose stoping is being done, though in this sort of work only a beginning has been made. The mine has two ore veins, and years will be required to exhaust the supply; in fact, years will be necessary to reduce the ore now in sight. We are somewhat surprised that more attention is not paid to prospecting in this vicinity, particularly by mining men from abroad who are throwing away thousands of dollars in districts far less promising than this one is. Outside of the Palisade mine there is little labor being done, the main exception being

the Calistoga Consolidated property, where Dr. Smith is superintending the work of prospecting, the drift in rock toward the vein now being in 70 feet or more. This is the property upon which a shaft was sunk a few months ago, work being suspended on account of a strong flow of water being encountered by cutting into the side of the vein. The drift in which work is progressing will cut the vein many feet below the bottom of the shaft in question, and also drain the ground for such prospecting as may thereafter be deemed necessary. The company has strong hopes that the Calistoga Consolidated will make mine No. 2 in this district. San Francisco parties are interested in it. We have many times called the attention of men in this vicinity to the fact that some of their spare time might be profitably devoted to prospecting.

Nevada.

THE WASHINGTON.—*Transcript*, Dec. 12: Superintendent Tregido of the Washington mine, at Ormonde, is in town. Underground operations at the mine are being steadily pushed and the ledge looks better than it ever did before. It has widened to 16 feet in the face and is of excellent quality. The main tunnel is to be pushed along the ledge into the heart of the mountain and crosscuts will be made so as to fully develop all the valuable ore deposits. In the spring the mill will be started again. The cold weather in that locality prevents successful crushing during the winter months with the facilities now at hand, but by next winter a series of furnaces will be constructed in and around the mill so as to maintain a uniform temperature of the water used in the batteries and on the overshot wheel which furnishes the power for the machinery.

A PAYING MINE.—The Nevswest mine at Willow valley in this township is paying largely. Nine tons of ore sent below for reduction paid nearly \$300 a ton gross, giving the owners over \$250 a ton besides cost of shipment and milling. Forty-five tons of ore recently taken from this mine paid an average of \$700 a ton. The Nevswest is owned by a company of practical miners who do their own work and have shown great pluck and perseverance in staying by and developing it despite many difficulties and discouragements. The owners of this valuable property are Elisha Hampton, John Goynne, J. J. Lyons and George True.

HARTERY MINE.—*Grass Valley Union*, Dec. 13: The Hartery mine, owned by Edward McLaughlin, of San Jose, and Wm. Loutzenheiser, has been bonded to A. W. Stoddard. The negotiations have been in progress for some time and have just been completed. The bond is for the term of three years, at the end of which time Mr. Stoddard has the option of its purchase at \$40,000, in the meanwhile paying a royalty of ten per cent from the product of the ore extracted. He will commence operations upon the mine without delay. The Hartery is well located in the group of mines in the southern part of the district that have been large producers, such as the Allison Ranch, New York Hill, North Star and Omaha, all of which are near by, and the two last named now in successful operation. With proper development there is no doubt that the Hartery will prove a good mine.

GRASS VALLEY.—Grass Valley is the boss quartz mining district of the State, and is becoming better all the time. Good wages are paid, none but white men are employed, and strikes are never thought of or threatened.

Placer.

MORNING STAR.—*Grass Valley Union*, Dec. 13: The Morning Star gravel mine, near Iowa Hill, is showing up well, although the mill has not been able to run much for months, owing to the limited supply of water. The last run made just before Thanksgiving day, of 35 bours, gave a yield of \$1700, paying all current bills and giving a dividend of 50 cents a share besides. The drift along the gravel channel, which was started from an upraise of 25 feet above the tunnel level, has prospected finely, and paid well the entire distance. Of late the bedrock has been pitching, and the water has become so troublesome that it has been determined to drive the main tunnel ahead for the purpose of bottoming the channel. With this purpose in view a contract has been let at the price of \$9 per foot. As the width of the gravel channel has never been ascertained, a T drift is to be run directly across it, and the gravel that will be drained by this work will be mined out until such time as the main tunnel reaches the low point of the channel that cannot now be worked on account of the water. The claim is evidently rich, as the gravel generally pays \$12 to the carload, and even \$20 to the pan has been taken out. There is a large extent of ground to be worked. J. H. Neff of Colfax is the superintendent of the Morning Star.

NEW MILL.—*Placer Republican*, Dec. 12: The new 20-stamp mill of the May Flower mine is completed and was started up yesterday. This new mill is called one of the best in the State. There is a self-feeder with each set of five stamps, and a Eureka rubber in front of the apron of each five stamps. At present the machinery is run by a 75-horse power engine. The boiler is 16 feet long and 54 inches in diameter. The mill is also equipped with a five-foot Pelton wheel so that the stamps may be run either by steam or water. A 22-inch pipe brings water to the wheel from the new Union ditch. The pressure is 440 feet. The machinery is placed in such a way that water alone may be used when there is the necessary quantity, or steam can be used alone if there is no water; or water and steam combined may be used if found advantageous at any time. Everything at the mine is looking very well.

LIVE OAK.—The Live Oak mine near Forest Hill is still prospecting, and for the last two weeks it has looked encouraging. A drift of 200 feet has been run in the bedrock, and an upraise of 37 feet at the end of the drift shows indications of a new channel which they are now trying to cross by a crosscut. So far the bedrock has pitched eight feet in each 12 feet of drift. The signs are good—blue cement and blue gravel.

Trinity.

EAST FORK ITEMS.—*Journal*, Dec. 8: Capt. Truworth of East Fork was in town this week and gives us the following items in regard to that camp: He is working eight men on the North Star mine, taking out ore and running tunnels. The ledge in the North Star proper is four feet wide and carries free gold and sulphurets. With this property are three more ledges, varying from 18 inches to 4 feet in width. A five-stamp water-power mill, with a

capacity of three tons a day, is now running; an ore-feeder and rock-breaker, which will be put on, will increase the capacity to five tons a day. A concentrator will also be put on to save the sulphurets. This mine will prove a valuable property; a number of experts who have visited it the past summer speak highly of it. It only needs increased crushing capacity to become one of the finest properties in the district. Capt. Truworth will start an arastra this week, crushing ore from mines on Barney gulch. He has 600 tons of ore from the various ledges in which he is interested, ready to be crushed. In the Belle mine a tunnel has been run and the lead stripped 150 feet; there are 200 tons of good ore on the dump. The prospects are good for a high-paying mine. W. T. Garratt of San Francisco is interested in this property. Four men are now working on the Fountain Head, driving tunnels and stripping the larger lead, which is now exposed 250 feet; the second ledge of the mine is one foot and the third eight inches in width; all carry free gold and sulphurets. On the Thanksgiving, which adjoins the Fountain Head, over 500 feet of tunnels have been run and men will be put on to still further develop it; the ore will pay well to mill. Several hundred dollars have been laid out on the Grizzly in the way of development work and the mine is showing up well. The Simmons Bros. are at work on the Web Foot, running tunnels and taking out ore; they talk of putting up an arastra to crush their ore; they have 50 or 60 tons of ore on the dump. Every arastra and two mills are now running in the district and considerable bullion will be produced there this winter. A 10-stamp mill is on the way, which is to be set to work on \$100-rock. There are 75 or 80 men in camp now, and another season will double the number. The prospects of the camp are wonderfully good, and another season will see it take giant steps forward.

NEVADA.

Washoe District.

YELLOW JACKET.—*Enterprise*, Dec. 15: Work has been resumed and ore is again being shipped to the Santiago mill.

BULLION.—All work again going on as usual.

CON. IMPERIAL.—The repair work on the 1100 level is still in progress.

CHALLENGE CON.—During the past week 200 tons of ore have been extracted and sent to the Brunswick mill. The average assay value of this ore was \$32.95 a ton.

CONFIDENCE.—The usual amount of ore is being taken out and shipped to the Brunswick mill.

BALTIMORE.—The usual amount of prospecting work is in progress.

CHOLLAR.—The raise from the 650 north drift is in quartz showing value. On the 750 and 850 levels the west drifts are still in clay and quartz. Half the Nevada mill is being run on Chollar ore, the machinery being run by the surface Pelton water-wheel.

CROWN POINT.—Ore of good quality is showing in the raise from crosscut No. 1 on the 700 level. The boxes will all be in place in the drain drift to the Suro tunnel by the end of the present month.

BELCHER.—The north drift on the 200 level is still being advanced in quartz and clay. On the 1100 level the joint Seg. Belcher drift is in vein material carrying some metal.

SEG. BELCHER.—On the 1100 level the joint Belcher drift is in vein material carrying some metal.

JUSTICE.—Work is being continued on the north drift. Are putting in two batteries of five stamps each in the room of the cannon-ball crushers.

ALPHA.—The north lateral drift on the 500 level is still in clay and quartz. The south lateral drift is in ore that assays from \$15 to \$20 a ton.

POTOSI.—The south drift on the 650 level is being advanced in clay and porphyry.

SAVAGE.—The southeast drift on the 400 level is now out 742 feet, and the north drift 165 feet. Both drifts are in promising vein material. The main west drift on the 400 level is making good progress. Are stoping ore from the east crosscut on this level, also from the south drift. On the 600 level are extracting ore from Nos. 2 and 3, east crosscuts, also from the old stopes on the 750 level. During the week have hoisted 491 tons of ore and have shipped to the Rock Point mill 237 tons. Average battery assays, \$20 per ton.

HALE AND NORCROSS.—On the 500 level the main west drift is out 40 feet and is in material that gives fair assays. Are still stoping ore from the body recently discovered on this level, and have extended a drift north 50 feet, following the ore. The face of the drift continues in good ore. On the 600 level the west drift has been extended 40 feet, making its total distance 115 feet. The stopes on this level are looking well and yielding the usual quantity of fair-grade ore. On the 800 level, from the face of the north drift, have started No. 9, east crosscut, which is advanced 35 feet. The face is in quartz and porphyry. Have bullion on hand and previously shipped this month amounting to \$22,400.

GOULD AND CURRY.—On the 200 level the north drift started 100 feet from the top of the upraise from the 300 level has been extended 28 feet; total length, 100 feet; formation, hard porphyry. On the 450 level the west crosscut started 60 feet from the top of the upraise from the 500 level, has been extended 16 feet; total length, 136 feet; formation, porphyry with streaks of quartz. On the 625 level the work of repairing the main south drift is still in progress.

BEST & BELCHER.—On the 300 level the incline winze has been sunk seven feet; total depth, 70 feet. Formation porphyry and quartz, showing some value. In this winze at a point 50 feet below the 300 level a small station has been cut out and an east drift advanced 15 feet, passing through eight feet of ore of fine quality. A north drift started 25 feet west of the winze has been extended 20 feet; total length 50 feet. Formation porphyry, clay and quartz, showing some value.

CON. CAL. & VIRGINIA.—The usual quantity and quality of ore is being extracted from the stopes on the 1400 level. On the 1435 level the north drift from the bottom of the winze continues in ore, and the stopes east of the winze are yielding well. On the 1500 level still stoping ore from the stopes opened out southeasterly from the upraise 58 feet above the track floor of this level. Some ore is still obtained

on the 1600 level from the drift running south from the Ophir. On the 1650 level are stopping out of ore of good quality in a number of places, and are doing a considerable amount of prospecting. On the 1650 level are extracting ore of fair quality from the old stopes in the south end of the mine. During the past week the usual amount of ore has been shipped to mills on the river, and the average of the battery samples will be about the same.

UTAH.—The main west drift on the 600 level is in a favorable formation.

OCCIDENTAL.—The winze down from the upper tunnel level is in a mixture of quartz and porphyry assaying well. The east crosscut from the north drift on the 100 level is in material that carries metal. The winze down from the lower tunnel is yielding ore that pays \$20 a ton.

NORTH OCCIDENTAL.—The north drift from the 400 level of the Occidental is making good headway. The face is showing streaks of good ore.

UNION CON. AND MEXICAN.—On the 1465 level a joint Union drift started from the east drift from the Ophir shaft is in Mexican ground a distance of 246 feet.

OMIHA.—The south drift on the 1465 level is in vein porphyry with many clay seams.

WEST CON. VA. & CAL.—Sinking of the main shaft resumed.

Wild Rose District.

SPRING CITY MINES.—Silver State, Dec. 13: W. B. Todhunter, who has just returned from a trip to Spring City, says he was informed while there that the Paradise Valley and Cliff mines at that place are looking unusually well. They have, he was told, a fine body of ore in the Wild Goose, and he saw wagon-loads of it which seemed to be rich. They have also good ore in the 70 foot and 110 foot levels of the Cliff mine, and the general impression of the miners is that there are large bodies of it.

ARIZONA.

MOHAVE.—Miner, Dec. 8: Supt. Geo. M. Bowers has shut down the Night Hawk mine until the first of the year. More locations will be made on January 1st in Mohave county than in any single year in its history. For the three months ending December 1, 1888, the Arizona Sampling Works at this place paid out for ore, \$85,500. C. E. Sherman reports the Queen Bee at Mineral Park as looking better than ever. A whim will be put up this month and the labor of hoisting lessened. The mill at Cerbat is being put in order by John Barry, and we understand that it has been leased to responsible parties and will be started up at the beginning of the year. There have, during the past week, been several mining experts in town, and several sales of mining property are reported well under way. The Flores G. M. Co. is now taking out a good deal of ore. The ore streak is reported as being four feet wide and working 100 ounces per ton. The mill is running and shipments of bullion are being made. J. F. Luthy leaves this week with several miners to commence work on his gold claim at Salt Springs, near the Colorado river, about 65 miles north of this place. Walter Scott, who is working a mining claim about 15 miles south of Franconia station, is now working four men and is taking out some first-class ore. These claims are located in a district but little prospected heretofore for lack of water. Mr. Scott is the only one who has done any development work to any extent in this district. The recent strike in the Prince George mine at Stockton hill has been worked well up to the dividing line. This property was divided some time ago. Dana & Howell purchased one-half from the owners, Thos. Christie and Caldwell Wright, they retaining the other half. The latter gentlemen were offered this week a goodly sum for their interest, but refused it and will work the mine themselves.

IDAHO.

BEDROCK FLUME.—Idaho World, Dec. 15: Four men are now at work for the Grimes Creek Bedrock Flume Co., putting up buildings for the winter and erecting a blacksmith shop. Winter supplies have been laid in, and as soon as the buildings are up a force of ten men will commence the construction of the flume, which commences in the canyon about a mile below the Big Bend. One hundred or 150 feet of flume 16 feet wide by seven deep will be put in before spring to catch the escaping quicksilver before that is continually passing down with the sand. It is supposed that the flume will carry all of the water of Grimes creek during the spring freshet, but precautions are taken against its raising should it not. The company owns eight claims of 20 acres each, which is abundance of ground for years to come. Superintendent Goldtrap says he intends pushing the flume as rapidly as possible, and hopes to soon have it on a good paying basis. As soon as the flume begins to show good cleanups other companies will be formed to work Ophir, Granite, Elk and More creeks, and placer mining will again be a great industry in Boise Basin.

BRITISH COLUMBIA.

NEW CAMP.—Donald Truth, Dec. 12: Nelson, the new camp in the Toad Mountain country, is about 185 miles from Revelstoke, which is its natural supply point. There is little doubt but that the district will turn out to be one of the richest ever discovered on the Pacific Coast. Hall Bros. are working 16 men, and have expended about \$6000 in erecting boarding and ore houses and in laying in a stock of provisions for the winter. Their ore runs from \$200 to \$240 a ton in silver. J. E. Dolen and Landry Morrow are working a day and night shift on their claims. LeBeau & Co. have four men at work running a tunnel on their claim on Cottonwood Smith creek. King & Snider have bonded four claims, on the same creek, to an English company, who evidently mean business, as they have written to the secretary-treasurer of the Columbia River Transportation Co. for tenders for transporting 12 tons of machinery from the C. P. R. at Revelstoke to the claims, which are situated about five miles south of Nelson. T. M. Ward, at the Kootenay ferry crossing, has several good claims, and is building a large hotel this winter.

OLD CAMP.—At the Hot Springs camp, 30 miles north of Nelson, G. B. Wright has 20 men at work on his No. 1 mine. An assay from an average sam-

ple of the ore taken from the full width of the face of the ledge gave \$500 to the ton. Mr. Wright will run a 300-foot tunnel this winter. He is also building a steamer to ply between his claims and Bonner's Ferry. Mr. Davenport has made a 30-ton shipment from his Little Donald claim, and is now working 10 men. W. Wheeler has 10 or 12 men at work on his great carbonate ledge. The Hendryx Co. is working 20 men, and there are a number of other claims, in both the new and old camps, working from two to four men each. About 150 men will winter in the district.

ORE SHIPMENTS.—This week the Monarch mine at Field shipped live cars of ore to the smelter at Vancouver, making 10 cars in the last two weeks. The shipment will approximate 200 tons. The ore carries about \$26 a ton in silver and a large percentage of lead.

TWENTY-DOLLAR NUGGETS.—Advices, believed to be reliable, come from Rogers Pass that rich placer ground has been worked on the quiet over near the headwaters of the Beaver for the last two years. It is known that nuggets ranging from \$5 to \$20 in value have been taken out. It is claimed that the ground is on a creek whose source is an immense hot spring, and that sluicing can be carried on the year round.

MONTANA.

SHERIDAN.—Inter-Mountain, Dec. 12: Mr. Dave McCranor said yesterday that he was just in receipt of news from Sheridan, stating that a valuable strike had been made by the Bedford Co. in their property on Ramshorn creek, about 12 miles from Sheridan. The Bedford has been under active development for the past six months, and the persistent labor of the company has at last been rewarded by the discovery of a large and rich deposit of lead and silver ore. The find is reported to be such that it will at once place this among the list of paying properties of old Madison county.

HARRIS AND LLOYD.—Work is in progress for the extensive development of this property by the Boston & Montana Co. A new boiler is now being placed in position which will be followed by the erection of a larger hoisting plant. George Tong is having a new boiler made at Maboney's foundry for his Goldsmith mine. The development of the Destroying Angel lode now being made by W. R. Davis & Co. is of the most flattering character. In the prospect shaft which is down only a few feet, rock was taken from it on Saturday which showed assay returns of \$55 in silver and \$5.60 in gold.

AT ANACONDA.—At this place work has not been resumed in full force yet. Part of the Upper Works furnaces have been fired up, but it is expected that the whole plant will be running next week, or as soon as the railroad company can guarantee an unfailing supply of fuel.

NEW MEXICO.

SHERIDAN MILL.—Silver City Enterprise, Dec. 1: Thirty thousand pounds of machinery arrived here last week for the Sheridan mill in the Mogollons. The mill is being remodeled somewhat, and better equipped to handle the ores of that camp. A wire tram will soon connect the mine and the mill. The mill will probably be running by the first of the new year. A shipment of seven or eight tons of ore was made from the Alhambra this week. Nine sacks of ore were shipped by express and were valued at \$3600, which was not considered a high value. E. G. Shields came up from Las Cruces on Saturday, and on Monday visited the Peerless mine. He will soon put a force of men to work on the property, with Sam Hughes of the Organs in charge. Frank Baxter, A. J. Whittington and Mr. Adams have given a four-months' bond on seven claims in the Silver basin, near Morenci, A. T., to Chicago parties, the consideration being \$15,000. The new company has day and night shifts working in two different shafts. General Boyle arrived from St. Louis this week and closed the deal for the Wagner mine, which now belongs to the Deep Down company. A contract has been let to Capt. Terise and Capt. Webb, two well-known miners, for the mining and delivery of 5000 tons of ore at the mill. Wm. Farrish, the gentleman who first placed and opened up the great Carlisle mine of this county, visited Silver City last week, arriving in the evening, and leaving the next morning for the Santa Rita copper mines with Geo. D. Roberts. They returned the same evening and left on the next morning's train. The object of this visit is not definitely known, but it certainly augurs well for the speedy resumption of operations at the Santa Ritas.

CARLISLE.—The net output for the Carlisle for October was \$10,000. About 30 tons of concentrates per day are being made, besides the free gold caught on the plates. About eight tons of concentrates per day are being smelted, the smelter now working as satisfactorily as could be desired. While the smelter is working entirely satisfactory, it is still questionable whether it pays the company better to ship in its fluxes and coke or to ship out all its concentrates. The company has found it advantageous to sever all business connections with the Clifton railroad, and proposes to transport its twenty odd tons of concentrates to Lordsburg daily overland, and has already entered into a contract with freighters to do the work for one year.

UTAH.

DISCOVERIES AT TINTIC.—Salt Lake Tribune, Dec. 13: The past week witnessed some excitement in Tintic over discoveries along Boulder creek, not far from Eureka. These discoveries were of such character as to cause a stampede and the staking of claims all over the country. The small openings so far made show good bodies of lead-silver ores, and there is promise that some of the claims will be developed at once.

THE COMET OPERATIONS.—The Comet Smelting Works Co. is making good progress in erecting a 40-ton water-jacket smelter in Copper gulch, Beaver county. A large force of men is employed and the buildings will soon be inclosed. The machinery is also getting in place so that early in January the works will be in full blast. First-class ore will be smelted, while the low-grade is to be tested by a new leaching process, for which a building is going up in which there will be several tanks, placed in regular steps, so as to drain from one to another. The com-

pany is showing commendable energy in putting their plant in readiness for operating, and Copper gulch gives promise of soon becoming a very active mining and ore-reducing district.

OREGON.

LOOKS LIKE BUSINESS.—Brock Democrat Dec. 13: The Oregon Gold Mining Co., operating the Eureka & Excelsior mines at Cracker creek, has let a contract to Messrs. McEvan & Guthrie, of the Canyon and Baker City Stage Line, to freight into Cracker creek from this city 64,000 pounds of freight, the greater portion of which is machinery for the new mill which the company proposes erecting in the spring. They have also let a contract to the same gentlemen to haul 60,000 pounds of ore to this city for shipment to Denver for reduction. From present appearances the E. & E. Co. intend making every preparation for extensive operations in the spring. This, with the active operations on the Columbia and North Pole mines, will make Cracker creek boom the coming season.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Dec. 20, 1888.

Business is dull, with no improvement looked for until after the holidays. So far as can be ascertained, the year drawing to a close has been fairly prosperous in all branches, although a few individual complaints are heard. As a rule, merchants and others engaged in business are reported to be easier, financially, at the close of the year than for several years past. The banks report an easy tone to the money market, with no decided call for funds and none looked for until the turn of the year, unless a stock speculation sets in soon. All present indications point to an early bill movement so as to repeat the old trick of unloading on the public at higher prices. The mines whose stocks are listed on the two exchanges are having work of a promising character done, which is likely to give results that can excite a large speculative movement, calculated to draw in outside buyers. The news from the mines is confirmatory that the work in West Con. Virginia is demonstrating that the Red Lode is a true fissure vein. With crosscutting that is to be commenced soon, it is claimed by mining men that a large and valuable ore deposit is likely to be run into. This belief is causing the various west side companies to prepare for active work in their mines. Outside of this the 1465-foot drift in Ophir running into Mexican toward Union is quite important, and it is claimed that with crosscuts run, valuable deposits of ore are likely to be run into. The 1650-foot and 1750-foot levels in Con. Virginia are proving to be very rich in mineral ore. In Hale and Norcross they are in good milling ore over 12 feet wide on the 500-foot level, with the vein increasing in width as it goes toward Savage, having already widened out over 6 feet. In Savage on the 400-foot level they are drifting to the west so as to intersect the ledge found on the 500-foot level of Hale and Norcross. In Best and Belcher work is being pushed forward so as to demonstrate the extent of the late "find." The drift in Con. Imperial is being pushed forward toward Alpha. In Crown Point on the 700-foot level west in the upraise toward the 600-foot level, better ore is found, with the vein growing wider. One of the most important works in the Gold Hill mines is that of having the drain-boxes nearly completed, which will admit of Crown Point and Belcher being opened to the west on the Suro tunnel level, and if it proves to be as rich in mineral as experts claim it will, then pumping will likely be commenced so as to go deeper. In the Quijota, Tuscarora and Bodie districts, news is of about the same tenor as heretofore reported.

SILVER.—The market held firm at unchanged prices up to Tuesday, when lower prices ruled in sympathy with a decline abroad. For shipment by steamer to China, which sailed on last Tuesday, 93c was paid. The steamer took out in bullion, \$309,000 to Hong Kong and \$95,000 to Hio-go. The receipts of silver bullion are not large, but commencing with next month a large increase is looked for, chiefly from the Comstock mines, owing to more mills starting up.

London cables quote silver to-day at 42½@42 5-16 and New York telegrams quote that market at 92½@92¾c. In our market 92½c is bid with no sellers. As the leading mines appear to be worked in the interest of stock manipulators it is quite likely that there will not be any increase in the supply of silver bullion until the insiders buy more stock at a lower range of value than has been reached since last August.

QUICKSILVER.—The demand is quite free from the coast mines. It is said to be larger in this month than in December, 1887. Prices are unchanged, although it is claimed that concessions on our quotations were made by one seller.

LEAD.—The market is barely steady for pig. Eastern advices continue to report free transactions by consumers, but the heavy stock held by the assignees of Cordwith of Chicago is a weak spot in the market.

IRON.—The local market is dull and inactive. Importers are storing rather than to make concessions. For prompt shipment and to arrive, sellers' views are still above buyers', owing to the high prices abroad, and also high freights, although there are signs of the latter weakening.

COPPER.—The market is tending to easier prices. The East reports an inactive and dull market.

BORAX.—The market is steady, with the demand light.

COAL.—The mildness of the winter and the majority of householders having laid in liberal supplies in October, are against house coal, but steam coal is very firm for spot and nearly due, but weak for prompt shipment. The output of the coast collieries is steadily increasing.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Dec. 20, 1888.—The following are the closing prices the past week:

	Silver in	Silver in	Copper.	Lead.	Tin.
Thursday	42 9 16	93	\$17 23	\$8 23	\$1 85
Friday	42 9 10	93	17 50	8 70	21 75
Saturday	42 9 0	93	17 40	8 70	21 70
Sunday	42 9 16	92½	17 00	8 60	22 00
Tuesday	42 10	92 11 16	17 15	8 70	21 80
Wednesday	42½	92 9 16	17 10	8 75	21 80

There is a light demand for quicksilver at 60¢/62c. Late offerings of Lake ingot copper were rejected at \$17.25. There was a small January sale at \$17.85. Consumers' wants are not urgent, and they can obtain a suitable quality at \$16 50. The market abroad is spiritless. The lead is weak with an abundant supply. There were 15 carloads on 'Change, which sold at \$3.70@3.75 for December and January. Outside 700 tons were placed \$3.75 down to \$3.65, deliverable within the next 60 days. Refined petroleum is stronger. Barrels, \$7.20@7.30; plain cases, \$9.30.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

Prices generally ruling for metals not regularly dealt in on Call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, @—; Biliton Tin, \$24.50@—; Banca Tin, \$24.25@24.50; Baltimore Copper, \$15.00@15.50; Orford Copper, \$16.00@16.25; P. S. C. Copper, @—; Foreign Lead, \$4.75@5.00; Foreign Spelt r, \$6.00@6.25; Antimony, \$10.00@13.50.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. P.) from week to week and year to year.

PARK PLACE.

(LAUNDRY FARM)

Between Fruitvale and Mills Seminary, Near Oakland.

To parties desirous of establishing Homes, a rare opportunity is offered to secure land at a price lower in comparison than anywhere else in California.

It is located only a short distance from Oakland, between Fruitvale and Seminary Park, and immediately adjoins the grounds of Mills Seminary.

The land is just rolling enough to render it beautiful for building sites. Situated at the base of the foothills, it has a most desirable climate, and its proximity to the best Female Seminary in the State makes it suitable as residence property for families having girls to educate whom they wish to have live at home.

The land can now be purchased at a low price, in Lots or Blocks, with the certainty of a quick rise in value.

For investment, it is an opportunity which rarely occurs, as Oakland is rapidly extending in this direction, and must, in the near future, include this land within its limits. This is proved by the fact that in 1860 Oakland had but 1000 people; in 1870, 10,000; in 1880, 30,000; now, 65,000 and growing more rapidly than ever.

People in the interior who desire to educate their children at the State University, in Berkeley, or at schools in Oakland or San Francisco, can establish here a rural home and be constantly with them.

This land was part of the Laundry Farm, that old and well-known Summer Resort, and is just far enough from the Picnic and Camping Grounds to be desirable and add value.

PARK PLACE is connected with Oakland and San Francisco by the Alameda County Railway, having eight trains each way daily. For particulars, inquire of the owner,

394,236.—WINDOW SCREEN—Willard & Wilson, Pasadena, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CABLE RAILWAY GRIP AND CROSSING DEVICE.—J. J. Graff, S. F. No. 394,356. Dated Dec. 11, 1888. This patent covers a cable railway grip and mechanism whereby the grip may be closed and opened, and when open may be raised above the line of a second cable which crosses the first one transversely. The invention is an improvement upon a mechanism for which letters patent were granted to the same inventor July 2, 1888. The present invention relates to certain details in the construction of the gripping mechanism.

BENCH PLANE.—Wm. Stevenson, Douglass Flat, Calaveras county, assignor of one-half to John Monteverde, Stockton. No. 394,411. Dated Dec. 11, 1888. The invention relates to the class of planes in which blades of different character are combined in the same stock; and it consists in the novel stock, the double-ended blades, and their manner of arrangement and means for adjusting them in the stock. The object is to provide a plane of simple construction and which, by reason of its different blades, is adapted for several uses.

WELL-BORING DEVICE.—George Atkinson, Oakland. No. 394,322. Dated Dec. 11, 1888. The excavation is formed of two semi-cylindrical shaped iron scoops having the lower ends tapered and pointed. They are adapted to be opened and closed from above, so as to dig into material in the bottom of the hole, retain said material, and he withdrawn to the surface when the earth is removed.

SPARK-ARRESTER.—Edgar M. Luckett, Sacramento. No. 393,994. Dated Dec. 4, 1888. This improved means for arresting sparks in locomotives consists in the application of a hinged adjustable deflecting-plate and a supplemental netting, in conjunction with a horizontal netting within the extension front or smoke-box of the boiler. The horizontal netting acts first, and the exhaust pipe extending up through it and being surrounded by the cylindrical netting, the latter acts supplementary to the horizontal one, thus providing two checks for the cinders.

MECHANISM FOR OPERATING STATION INDICATORS.—John Knight, S. F., assignor to Pacific Indicator Company. No. 394,074. Dated Dec. 4, 1888. The invention relates to the indicators used in street cars to designate streets or stations and at the same time present to view advertising matter. The invention consists generally in a novel mechanism for operating the indicator, the object being to provide a simple mechanism for transmitting to the indicating apparatus the power derived by contact with a fixed obstruction in the roadway, and yet so modify the power in strength and time of transmission as to render its application noiseless and without suddenness or jar. An air cylinder or air cushion is utilized.

OPERATING STATION INDICATORS.—Benjamin W. Lyon, S. F., assignor to Pacific Indicator Company. No. 394,077. Dated Dec. 4, 1888. This covers an improvement on another patent issued to the same inventor last June. The object of the present invention is to provide a means for moving the rotary disk by which the indicating mechanism on the car is actuated, and to overcome the difficulty which arises when rack and pinion are used for this purpose. When the rack is drawn back so far as to become disengaged from the teeth of the pinion, it is not possible to always secure the proper meshing of the teeth when they come together again. The inventor provides a positively operating device which is not open to the objectionable features of the rack and pinion.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

AMERICAN CHAMPAGNE CO., Dec. 13. Object, to manufacture effervescent liquors. Capital stock, \$250,000. Directors—Gustave Niebaum, Louis Sloss, Jr., Thomas Wilkinson, George W. Sessions, W. P. Willard, David Wood and Benjamin L. Burling.

HATCH-ARMSTRONG FRUIT & NUT CO., Dec. 14. Object, raising nuts, fruits and vines and the manufacture of wines and brandies. Capital stock, \$250,000. Directors—A. T. Hatch, E. F. Armstrong, Elbert Armstrong, Albert Montpelier, and Frank McMullen.

BELLA VISTA VINEYARD CO., Dec. 14. Capital stock, \$20,000. Directors—E. J. de Pue, W. H. Phelps, E. D. Goodrich, F. M. Pray and F. McMullen.

WILLIAM LEWIS CO., Dec. 14. Object, to deal in tobacco. Capital stock, \$100,000. Directors—Francis Buckley, Jr., S. W. Levy, Solomon Lewis, Sigmund Hirschbaum and W. S. Baxter.

FRESNO WAREHOUSE CO., Dec. 15. Capital stock, \$100,000. Directors—George H. Eggers, Charles Kohler, F. T. Eisen, G. H. Walter and A. P. Adams.

CALIFORNIA PROHIBITION CO., Dec. 18. Object, to publish the California Prohibitionist. Capital stock, \$25,000. Directors—Henry French, J. B. Capp, C. A. Tupper, F. T. Holland, A. Calhoun, G. A. Rembrand, W. E. Ward, J. D. Shafter, all of San Jose; T. B. Stewart and A. G. Scheahan of S. F., and H. B. Land of Oakland.

PAYNE BOLT WORKS, Dec. 18. Object, a general iron-manufacturing business. Capital stock, \$300,000. Directors—Wm. Payne, G. L. Payne, Noah Payne, C. H. Williams and W. Newham.

PACIFIC PHONOGRAPH CO., Dec. 18. Object, to make and sell the Edison phonograph. Capital stock, \$2,500,000. Directors—Frank McLaughlin, J. I. Sabin, Andrew White, Louis Glass and M. Greenwood.

CAMP CREEK M. CO., Dec. 18. Directors—Daniel E. Hayes, J. H. L. Tuck, Wm. H. Sears, A. S. Folger and H. P. Christie.

Mining Share Market.

Mining stocks continue dull and inactive and are not expected to recover much before the middle of next month. The decrease of water in the Carson river to a point below the full milling stage has helped depress the market. This influence, however, is about at an end, if the present storm shall not break and scatter.

The Nevada mill is running to half its capacity on Chollar ore, the machinery being driven by the surface Pelton water-wheel. The apparatus for the transmission of power electrically from the six Pelton wheels on the Suvo tunnel level has not yet worked satisfactorily. The dynamos are now being overhauled.

The Alta mill will soon resume operations enlarged to 20 stamps. They have in the mine opened up and ready for extraction a large amount of ore.

The Justice mill will soon have the stamps dropping on ore from their mine.

"HAZELTON" BOILER PATENT CONTEST.—The action at law of the "Hazelton" Boiler Co. vs. the Hazelton Tripod Boiler Co., pending in the United States Supreme Court at Washington, D. C., involving certain infringements of patents of the former by the latter named company, was decided on the 18th instant in favor of M. W. Hazelton, assignor of the patents to the "Hazelton" Tripod Boiler Co., which is represented in the Pacific States and Territories by the Joshua Hendy Machine Works of this city as managers.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued through the failure of the subscriber to notify us to discontinue it, or of some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Assessment Notices.

Gover Mining Company—Location of principal place of business, San Francisco, California. Location of works, near Drytown, Amador County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors held on the 23rd day of November, 1888, an Assessment (No. 1) of Fifteen (15) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Nos. 13 and 15 Fremont street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 31st day of January, 1889, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on Monday, the 11th day of February, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.
L. G. HARVEY, Secretary.

Office—13 and 15 Fremont Street, San Francisco, Cal.

Lord of Lorn Gold and Silver Mining Company. Location of principal place of business, City and County of San Francisco, State of California. Location of works, Gold Hill Mining District, State of Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 19th day of December, 1888, an Assessment (No. 4) of Ten (10) Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 313 California street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 21st day of January, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Monday, the 11th day of February, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.
L. G. HARVEY, Secretary.

Office—313 California St., San Francisco, Cal.

STOCKHOLDERS' MEETING.

OFFICE OF

The Superior Mill and Mining Company.

A SPECIAL MEETING of the stockholders of the Superior Mill and Mining Company will be held at the office of the company, Room 11, 303 California Street, S. F., on Wednesday, February 20, 1889, at 1 o'clock P. M., for the purpose of taking into consideration the increasing of the capital stock of said company from ten million (10,000,000) dollars, divided into one hundred thousand (100,000) shares of the par value of one hundred (100) dollars per share, to fifteen million (15,000,000) dollars, divided into one hundred and fifty thousand (150,000) shares of the par value of one hundred (100) dollars each. Transfer books will close on Monday, February 13, 1889, at 3 o'clock P. M. By order of the Board of Directors.
J. M. BUFFINGTON, Secretary.

Office—Room 11, No. 303 California Street, San Francisco, California.

DIVIDEND NOTICE.

FOR SALE.

The Empire Foundry and Machine Shop in the city of Marquette, now and for many years doing a remunerative business, is offered for sale at less than half its value. Everything as it stands—stock, machines, patents, real estate, etc., etc., will be sold on easy terms. A first rate opportunity for establishing an agricultural implement manufactory as an adjunct. This is the only foundry and machine shop in the neighborhood.

For further particulars address
R. HOSKIN, Marquette.

THE DUCKER PORTABLE HOUSES

Combine all the
advantages of a per-
manent building
with the qualities of
simplicity, strength,
lightness, ease of
transportation,
quickness of putting
up and taking
down, ventilation,
heating, and
electricity for
lighting. Equally

serviceable for Contractors' Cabs, for Sheep and Cattle Ranches, Mining Camps and for Surveyors and Prospectors, Hospitals, Seaside and Summer Resorts, and in all localities where material and skilled labor are scarce, and where it is sometimes desirable to change location. These Buildings can be especially constructed for Hunting and Fishing Camps, Billiard Rooms, Photographers' Studios and Lawn Pavilions. They are built in sections and are put up without the use of screws, nails or any external appliances whatever. Two men can put up the building on ordinary ground in 2 hours' time without skilled labor. Price, \$250 to \$750. Thoroughly reliable and inducement business men only. Any communication with this Company relative to acting as its representative, Address: DUCKER PORTABLE HOUSE COMPANY, 32 Nassau St., New York.

Portland, Or.

Sydney, N. S. W.

We are prepared to give estimates for Hoisting Works and Pumping Plants, Stamp Mills, Smelters and Concentrators.

THE "ECLIPSE" Copying Apparatus.

One thousand copies in black. No special pen, no special paper, no stencil required. The "Eclipse" reproduces the natural handwriting so exceedingly faithful that in most cases "Eclipse" circulars have been taken for ordinary written letters. Specimens and circulars on application.

FELIX F. DAUS & CO.,

698 Broadway, New York

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

PORTABLE and DURABLE.

WEIGHT, 4 TONS.

It is a Full Fledged Quartz Mill without Gearing, Cogs or Pulleys.

Power applied direct. Works Ore at Low Cost. More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working. The first ore crusher used in Durango, Mexico, was built at my shop in Sacramento, and under my patent.

Any infringement on this Patent will be prosecuted to the full extent of the law.

WM. GUTENBERGER, Sacramento Foundry, corner N and Front Sts., Sacramento.

COAL MINES OF THE WESTERN COAST.

A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for \$2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

A New and Important Book on Metallic Alloys, Solders, etc.

JUST READY.

—THE—

METALLIC ALLOYS

A Practical Guide for the Manufacture of all kinds of Alloys, Amalgams, and solders used by Metal Workers; together with their chemical and physical Properties and their Application in the Arts and the Industries; with an Appendix on the Coloring of Alloys. Translated and edited, chiefly from the German of A. Krupp and Andreas Wildberger, with extensive additions, by William T. Brandt, one of the editors of "The Techno-Chemical Receipt Book," etc. Illustrated by 16 engravings. 12mo, 428 pages. Price, \$2.00. By mail, free of postage, to any address in the world.

A descriptive circular giving the full contents of the above sent free to any one who will apply.

WE ALSO PUBLISH:

A Practical Manual of Minerals, Mines and Mining; comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including Architecture and Construction. By Prof. H. S. Osborn, LL. D. Illustrated by 171 engravings. 8vo, 367 pages. Price, \$4.00.

A descriptive circular giving the full contents of the above book sent free to any one who will send his address.

A Treatise on Metalliferous Minerals and Mining. By D. C. Davies. With 145 illustrations. 12mo, 432 pages. Price, \$5.00.

Mine Drainage. By Stephen Mitchell. 8vo, 277 engravings. Price, \$6.00.

A Treatise on Earthy and other Minerals and Mining. By D. C. Davies. With 76 engravings. 12mo. Price \$5.00.

The Prospector's Handbook. A Guide for the Prospector and Traveler in search of Metal-bearing or other valuable Minerals. Illustrated. 12mo. Price, \$1.50.

Mineralogy Simplified. Easy Methods of Identifying Minerals, including Ores, by means of the Blowpipe, by Flame Reactions, by the Spectroscope and by Humid Chemical Analysis, based on Von Kobell's Tables for the Determination of Minerals, etc. By Henri Eini, M. D. Illustrated. 12mo. Price, \$3.00.

Underground Treasures: How and Where to Find them. A Key for the Ready Determination of Minerals within the United States. By James Orton. Price \$1.50.

The above or any of our Books sent by mail, free of postage, at the publication prices to any address in the world.

Our New and Revised Catalogue of Practical and Scientific Books, 84 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

BRYAN'S ROLLER QUARTZ MILL,

The most perfect Roller Mill made, for the following reasons:

1. It is cheaper.
2. It is more durable.
3. It crushes a larger amount of ore with less power.
4. It amalgamates a larger percentage of the gold.
5. Its "clean-up" is quicker and fuller.
6. It is portable, requires no frame-work, and is ready for the foundation as it leaves the shop.

Full Descriptive Circulars of any of the above sent on application.

of Tyres will crush 1500 tons. One ring plate will crush from 2200 to 2300. The mills require very little attention. At our mill an ordinary "peon" earning one dollar per day has complete charge. In regard to slimes, in comparison with stamps by reason of the discharge surface and the continuous agitation by the scrapers, a much less amount of slimes is created. A three years' experience teaches me that, in every respect, the mills are a complete success and of material benefit to the mining world. They can be set up and running in 48 hours, and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator, it is unequalled by any mill now in existence.

Yours truly,

D. M. FURNS, Superintendent

OFFICE OF THE CANTALARIA CONSOLIDATED MEXICAN MINING CO.,
 SAN DINAS, DURANGO, MEXICO, October 25, 1888.

Risdon Iron Works, San Francisco—GENTLEMEN: Our Company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60-mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screen 12 tons in twenty-four hours; through 50-mesh, 15 tons; and through 40-mesh, 18 tons. This proportion has been continuous. One set of Dies will crush from 1500 to 1600 tons. One set

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES, THE GREATEST ROCK CRUSHER ON EARTH!

WHAT IS SAID OF IT BY ONE WHO HAS USED IT THREE YEARS.

OFFICE OF ERNEST L. RANSOME, MANUFACTURER OF ARTIFICIAL STONE AND CONCRETE,
 No. 508 CALIFORNIA STREET, SAN FRANCISCO, November 9, 1888.

Pacific Iron Works—GENTLEMEN: In answer to your request for my experience with the Gates Crusher with the Gates Crusher would say, that I have used one for the past three years crushing trap rock, basalt and granite for making concrete, the most of it being very hard and calculated to test severely the strength and durability of any machine.

I have crushed in that time probably not less than 10,000 tons of this material, without any repair being necessary, and without any change of ehoes and dies, and, as far as I can judge, they appear to be good for as much more service.

I have had more or less experience with nearly every crusher in the market, and regard the Gates as infinitely superior to them all. In fact its efficiency, durability and capacity for work is simply wonderful. For crushing all kinds of ore, ballast or macadam—fine or coarse—nothing can compare with it. You are at liberty to refer any parties to me who may want further evidence as to the merits of this remarkable machine. Very truly yours,

ERNEST L. RANSOME.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

VOLUME LVI
Number 26.

Spirally Welded Tubing.

We have several times of late alluded to the new industry of making serviceable pressure pipes of great strength from strips of steel or iron wound spirally, heated only along the overlapping edges, welded by hammering, and finished into tubes of uniform diameter, and of such length as may be desirable. The process of manufacturing these spirally welded tubes is interesting and was recently described by J. C. Bayles of New York, before the American Institute of Mining Engineers. The raw material is ordinary sheet iron, or steel of commerce. The lightest metal made into tube is No. 29 iron, and the heaviest, steel of between 12 and 14 gauge.

As it is difficult to obtain sheets longer than 12 feet, it is necessary to unite the ends by lap-welding, if long pipes are desired. To make a 6-inch pipe 30 feet long from 12-inch skelp, it is necessary to have a ribbon of metal about 49 feet long. The ends of the strips of skelp are united by a machine known as a cross-welder. The sheets are so placed as to give about $\frac{1}{2}$ inch lap, and in this position they are firmly clamped. Heat is then applied by furnaces above and below, which move along the seam. As they recede, the hot edges are welded between a hammer moving vertically and an anvil of reciprocal motion. To place and clamp the skelp, heat the overlapping edges and weld them, consumes about one minute to each cross-seam of 12 inches. A pressure of the foot of the operator upon a treadle engages a worm-wheel and worm which rotates a reel upon which the skelp is wound. As it is drawn from the reel, it passes between pressure-rolls which smooth out any buckling or other irregularity in the still hot metal, and rotary shears trim off the burr at the ends of the welded seam. In case the weld is defective or the sheets have not been clamped in line, the weld is cut by a shear held suspended when not in use, and the ends are welded again.

The pipe machine is quite simple in construction, and is chiefly made of heavy castings, requiring but little finish. It occupies about 3x6 feet of floor space. The engraving shows its form.

The essential features of the pipe machine are a guide-table for the skelp, adjustable to the desired angle; feed-rolls, to pass it forward with an intermittent progress, so that it shall advance when the hammer is raised and be at rest when the hammer falls; a former, to curve the metal to the desired radius, also adjustable; a furnace, to heat the metal; a hammer, to weld it, and an anvil to support the pipe and receive the shocks of the hammer. No mandrel is used.

The pipe in the forming process is held in place by a pipe mold, which is a cylindrical shell, within which the pipe rotates as the stock is

form in the refractory lining of the furnace. One gas flame has been found sufficient, but two work better; and besides being more conven-

MORGAN'S VENTILATING MANHOLE.

fed in. The anvil is of considerable mass, steel-faced, and extends the entire width of the skelp. The hammer is light, and at normal

ient to control, they heat the metal more rapidly and permit an accelerated feed. As very little gas is wasted, the greatest economy attends

MACHINE FOR MAKING SPIRALLY WELDED TUBING.

speed strikes 160 blows per minute. The heating is done in a furnace so constructed as to heat both the edges to be united for the space of several inches ahead of the point at which the welding is effected. The upper skelp enters the furnace flat, and the lower skelp curved, having already been through the forming-jaws. The heat is imparted by one or two blow-pipes of water-gas and air, discharging upon the metal through passages of suitable

the most rapid production of pipe, irrespective of the quantity turned, which in any case is about 30 feet per foot of welded seam.

The speed of production depends, as stated, upon the thickness of stock to be heated and the relation of width of skelp to diameter. It averages a foot per minute to each machine, and it is probable this average can be raised considerably. The machines are so nearly automatic in operation that very little skilled labor

is needed in running the plant. The operator has his gas, air and feed under control by convenient means, and varies the relations until he has them just as he wants them. He can see the edges as they emerge from the furnace, and about all the skill he needs is that which will enable him to judge by its color whether the iron is above, below or at the welding heat. Unskilled labor prepares the stock and removes the finished product.

Ventilating Manhole for Sewers.

Engravings on this page illustrate the ventilating manhole recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency by Thos. W. Morgan, City Engineer of Oakland, Alameda Co. The construction is quite simple but effective. As the sewer gas or vapor arises from the sewer into the manhole, the close-fitting pan prevents its escape (as ordinarily through the perforated cover over the main opening), and the gas is forced through the grating and flue, through the charcoal, which deodorizes the gas and arrests and destroys any germs of disease which may come up from the sewer. The air then passes through the opening in the side of curb to the space between the pan and cover and thence through the perforations of the cover to the open air in the street or yard. Numbers of these appliances are now in use in Oakland and elsewhere, and giving good satisfaction.

As to the use of charcoal as a disinfectant, Eliot & Storer's Inorganic Chemistry says it depends not merely upon its mechanical ability to absorb offensive gases, but also, and mainly, upon the fact that the absorbed gases are chemically destroyed within the pores of the coal by the oxygen which is sucked into these spaces from the air. The purifying action depends upon oxidation, upon the burning up of the offensive gases as fast as they are formed. A great merit of charcoal as a disinfectant is that it constantly draws into destruction the offensive matter around it.

"Sieves of charcoal placed across the air-vents of sewers in such manner that the outgoing air may be filtered through the charcoal, are found to be most effi-

cient instruments for destroying the noxious effluvia which commonly escapes from these openings. In this case, where a current of air is constantly passing through the charcoal filter, the latter will preserve its efficiency for an indefinite length of time if it only be kept dry; for the action of the coal consists in merely bringing about oxidation and destruction of the gases of the sewer, and as one portion of this is consumed a new portion can be taken into destruction."

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Lixiviation of Silver Ores With Hypo-sulphite Solutions.

NUMBER 4.

The presence of caustic (soda or lime) in the leaching solution is generally injurious to the extraction of silver. Mr. Stetefeldt explains this by the supposition that a certain proportion of caustic will act superficially on particles containing silver and lead, copper, etc., producing a film of insoluble hydroxide. This looks plausible, and may be the true explanation, yet it would seem that, if it were so, the presence of enough of caustic soda to dissolve that film (in the case of a silver-lead compound) should result in the extraction of the silver. Again, it would seem that sodium carbonate should also produce an impeding film, since the lead (and cupric) carbonate is as insoluble as the hydroxide, yet Mr. Stetefeldt declares the sodium carbonate to be harmless; as a matter of fact, in one instance it did prevent the extraction of silver. However, I am not prepared to give any better explanation at present. Suffice it that caustic is harmful; let us see how it may be avoided or corrected.

I have shown in a previous article that calcium polysulphide is not likely to cause causticity of the hypo; sodium polysulphide is very liable to contain caustic soda unless made in strict conformity to certain rules—so says Mr. Stetefeldt. Add to these facts that caustic soda decomposes calcium polysulphide, forming sodium polysulphide and precipitating a salt of lime (calcium hydrate?) and we at once perceive a ready means of neutralizing a caustic sodium polysulphide.

To a solution of sodium polysulphide, caustic soda was added, and the liquid was divided into two parts: To the one part, *a*, calcium polysulphide was added as long as it produced a precipitate; to the other part, *b*, no addition was made. A solution of silver in sodium hypo was divided into two parts, *A* and *B*. The silver in *A* was accurately precipitated by *a*; that in *B* by *b*. After settling, *A* was neutral to litmus and to turmeric; *B* was strongly alkaline.

Here a new phenomenon presented itself. Although *B* had not received an excess of *b*, yet, after a short time it contained free sodium sulphide. This, though unexpected, is easily accounted for; the caustic soda had reacted on the free sulphur in the precipitate, forming sodium sulphide. This illustrates the ease with which the free sulphur in the precipitate may be recovered in this form of polysulphide by simply digesting the precipitate with caustic soda or milk of lime (see my book on *Leaching Gold and Silver Ores*). Theoretically it would be possible to precipitate with a polysulphide containing caustic, and obtain a precipitate free from uncombined sulphur, and a liquid free from caustic, but in practice this would not be feasible; it is better to add calcium polysulphide to the sodium polysulphide as long as it precipitates; the lime which settles out may perhaps be used again for making the calcium sulphide, of which but little will be required, and that can be kept any length of time in carboys or casks.

Caustic in sodium sulphide may be neutralized by an addition of sodium bicarbonate, the quantity being controlled by a test as in the case of caustic hypo. Another method is to force sulphur dioxide into the liquid until hydrogen sulphide is evolved. Sulphur dioxide may be made by burning sulphur in a simple form of furnace or kiln, the fume being pumped into the liquid; or it may be produced from sulphuric acid and a sulphite, or the same acid and charcoal in an iron retort by the aid of heat, in which cases a pump will not be needed; it will convert the caustic soda into sulphite which finally becomes hypo.

Carbon dioxide forced into the sodium polysulphide solution containing caustic will convert the latter into carbonate; it should be discontinued as soon as hydrogen sulphide is evolved, otherwise it will convert the polysulphide into carbonate. Carbon dioxide may be produced by the perfect combustion of charcoal or other carbonaceous matter or by the action of an acid on limestone or an alkali carbonate; also by heating zinc dust with calcium carbonate in a retort (only fit for the laboratory). But the most practical way in which to neutralize caustic sodium polysulphide is by adding calcium polysulphide. The desired result may also be attained by adding sulphuric acid, converting the caustic soda into sulphate. But the chief and most troublesome cause of causticity in the stock hypo is the presence of caustic lime in the roasted ore which then yields an alkaline wash-water. Lime is not sufficiently soluble in water to admit of the removal of any considerable quantity of it by the washing.

It is better to forestall the action of the lime than to correct the causticity produced in the hypo. This was done by Henry Kearsage at Tombstone, by washing the ore with acidulated water, the use of which, following a first washing with plain water, must be continued until it issues with a neutral or slightly acid reaction, when it may be followed by hypo. In the Russell process the result is attained by means of a solution of bluestone following the wash-water, and followed by the hypo. Solu-

tion of iron sulphate would serve the purpose and is cheaper than bluestone. Of other available methods we have the following: 1st. Impregnation of the first used portion of hypo with sulphurous acid, either by adding sulphuric acid, which decomposes some of the hypo, forming sulphurous acid, or by injection of sulphur dioxide, as already described. 2d. By a similar process with carbon dioxide in place of sulphur dioxide. 3d. By a solution of lead sulphate in hypo. 4th. By a solution of lead carbonate, made by passing carbon dioxide into hypo in presence of lead carbonate which rapidly dissolves.

A possible cause of causticity of the hypo in treating roasted ore is the presence of metallic silver; the methods 1, 2, 3, and 4, for prevention would probably be serviceable in such a case. In treating unroasted ores, we may have metallic silver or metallic copper in small particles, also cuprous oxide (red oxide of copper) either of which may cause causticity. Preventive measures may be those above described under 1, 2, 3, 4, or, in the case of cuprous oxide, washing with acidulated water, only that the acid should be not sulphuric but hydrochloric (or sulphuric with addition of a chloride, as common salt), which will convert the cuprous oxide into cuprous chloride. The cuprous chloride remaining in the ore will form "extra solution" with the first portion of hypo used, and this may be kept separate for application at a later stage if desired.

If the hypo has been permitted to become caustic, it must be neutralized. In the Russell process this is effected by adding an acid, such as sulphuric or hydrochloric. It would be better to use sulphur dioxide. Carbon dioxide is also suitable, though inferior. The sulphate of lead, copper or iron will answer, or the solution of lead carbonate, already mentioned. Sodium bicarbonate may be used, but it is rather expensive; the means of knowing when enough has been added have been mentioned in a previous article. Sodium bisulphate will serve the purpose, as it would also as a preventive in case of caustic lime in the ore, being dissolved in the water used for the washing. Sodium bisulphate is a cheap product of the acid works, and could probably be used with economy in place of sulphuric acid in any of these neutralizing operations. It may happen that a sodium hypo contains both caustic and carbonated soda, and, as both have an alkaline reaction, it has been suggested that there would be a difficulty in neutralizing the caustic while leaving the carbonate intact. This, however, is not so difficult. Take a measured portion of the liquid and add solution of calcium carbonate as long as it precipitates; if the liquid still reacts, alkaline caustic is present, and the quantity of acid or of sodium bisulphate required to neutralize it is the measure of the quantity required for the entire or any volume of the stock solution. If sulphur dioxide is used, it is of little importance to know when the caustic is neutralized, because, if the carbonate is also neutralized it only forms sodium sulphite, which is an excellent solvent for silver chloride, oxide, etc., and is as good as the carbonate to prevent the extraction of lead.

Since writing article No. 3 I have found that the lead chromate settles very well if the liquid is slightly warmed and well stirred.

I have just made another experiment with a view to throwing light on the chemistry of the precipitation of silver. A part of the silver in a hypo solution was precipitated by sodium polysulphide, the remainder accurately by potassium xanthate (an extremely delicate reagent). Hydrochloric acid was added to the filtrate to decompose the thio sulphate, and after settling the clear liquid was decanted and some solution of mercuric chloride added. On warming for some time a white precipitate gradually formed, which assumed a yellowish tinge as it increased. The liquid, without the mercuric chloride, remained clear when heated. The reaction indicates the presence of tetrathionic acid, which must be present if my theory be correct.

I have not yet found a reagent which will indicate the presence of silver in hypo solution when other metals are also present, and such a reagent is a desideratum; but I have found a means by which a very small proportion of copper may be detected in presence of silver.

If solution of potassium ferriyanide is added to a solution of silver alone in hypo, the liquid is colored yellow. If but a trace of copper is present, each drop of the ferriyanide produces a reddish-brown precipitate, which redissolves and the liquid assumes a reddish color which is very distinct. With more copper the color deepens. This test may be of use in leaching.

Concerning the use of sodium sulphite, I find that when a precipitate of silver sulphide mixed with free sulphur is treated with a slightly warm solution of sodium sulphite, not only is the sulphur dissolved, making hypo, but the silver sulphide becomes very compact, forming lumps of malleable silver glance. Sodium sulphite is useful in the determination of the proportion of silver chloride in roasted or raw ores. The ore powder is washed and treated with solution of sodium sulphite as long as any metal is dissolved and the filtered liquid is decomposed by nitric acid; any silver which was combined with chlorine falls out as chloride, and that which may have been dissolved from other compounds (except bromide, which acts like chloride) may be precipitated from the filtered liquid by a soluble chloride. If the ore contains cuprous chloride that will interfere probably by yielding its chlorine to the liquid. Silver chloride and bromide dissolve readily in solution of sodium sulphite, while the iodide is

but very slightly soluble. As all three dissolve easily in aqueous sodium thiosulphate, the difference affords a means of at least an approximate separation of the haloids.

December 15, 1888. C. H. AARON.

Neglected Sources of Power in the Mines.

EDITORS PRESS:—As a general rule our mines are located upon the mountain ridges that divide the rivers and their principal branches from each other, and as a consequence very few of our mills and hoisting works are run by water-power because few streams of sufficient size exist above the sites they occupy within a reasonable distance. Though it is impracticable to try to make water run uphill, there is no natural law to prevent electricity, compressed air or wire cables doing so whenever economically practicable. There are plenty of streams leading down from the mountain ridges where the mines are located with sufficient water and fall—often within a few miles of a mine, though many hundred feet below its level—which might be utilized to drive a Pelton wheel or a turbine to furnish abundant power to drive dynamos to generate electricity, drums or pulleys to carry wire cables, or air-compressing machinery to furnish compressed air to be conveyed to the mines. It is a question of economy only which must determine in each case whether expensive steam machinery shall be erected at the mine or one of the other methods referred to be resorted to for the purpose of utilizing an available water-power below its level.

For instance, the cost of a plant for a Pelton wheel and dynamos, including wiring and motors, is light compared to that of steam engines and appurtenances of equal power, to say nothing of the cost of fuel and attendance. The expense of a wire-cable plant would probably be still less than that of the electric plant. In view of the success of our cable roads in this city, and of the recent successful trial of the electric outfit on the Comstock, the economical considerations involved are such as to recommend a trial, by some of those interested, to determine the availability of these methods in suitable localities of reducing the cost of extracting and reducing the ores of our gold and silver mines, especially in the higher mountain regions.

In regard to the use of compressed air in such cases, the writer believes a much cheaper and simpler mode of compressing air than that generally used may be adopted—one that is automatic and requires but a small quantity of water where there is sufficient fall to afford the pressure required. It consists in having the lower end of the pipe conveying the water so arranged as to discharge vertically into a tight, strong receiving-tank. One or more small air pipes must be inserted into the vertical portion of the pipe above the tank, with the stem reaching downward (inside the pipe) nearly to the open end, below the top of the tank (inside), through which the water is discharged under pressure. The upper end of the little air pipe, being outside the main or water pipe, should have a funnel mouth, so as to favor the passage of air, which will be sucked in and discharged with the water into the receiving-tank. This tank must have one or more discharge water-cocks near the bottom so as to regulate the discharge of water according to the inflow of the same. It must have also an air-cock or valve at the top to let the compressed air from the tank into a strong and capacious reservoir for storing the same preparatory to leading it through pipes to the mine for driving the machinery.

Water-blasts for forcing air into mining drifts for ventilation are not new, but the compressing of the air automatically for power to drive machinery is equally practicable with proper appliances. The scientific principles involved are the same. It is merely a skillful, yet simple, method of utilizing the well-known principles of the compressibility of air, of hydrostatic pressure and of the suction or inhalation of air by a descending column of water, under the conditions described. It has been done on a small scale, and may be certainly done on a large scale by machinery adapted to that purpose. Such a source of power, it will be readily seen, must be the cheapest of all where ordinary direct water-power is not available.

In the transmission of power from the generator or producer to the consumer the loss of power incident to the method employed and the distance traversed necessarily forms an important item in considering its availability for the purpose to which it is destined. Without going into details or statistical tables, it may be said that, for a distance less than three miles, wire-cable transmission of power suffers a lighter percentage of loss than either of the others, and beyond that it loses most. Electricity is now claimed by its votaries, however, to work up to a higher per cent than any other form of mechanical power. But where water-power is available in the ways above described, the percentage of loss in transmission is of less consequence than when using steam, the first cost of the power being so much less comparatively. By thus utilizing the pressure of small streams, within reasonable distance from the mine, existing below its level, in one of the ways suggested, reduction works can always be located at the mine and thus save hauling; and if there is not water enough for the batteries available above

the level of the mill, it may be supplied by hydrostatic pressure, or force pumps, working automatically from a lower station. There are many mines in California containing an abundance of good ore that are condemned, or idle, for lack of water sufficient for steam or battery purposes that can be brought to them by gravitation, which might be rendered valuable and productive by conveying power or water, or both, from some available source at a lower level in one of the ways above described. Such neglected sources of power are abundant in the mining regions, and these suggestions have been written in the hope that they may be more generally utilized in the future than they have been in the past. PROGRESS.

Mining Company Meetings.

At the annual meeting of the Ophir Mining Company the following officers were elected: President, Chas. H. Fish; vice-president, A. B. Hull; A. W. Havens, Con. O'Connor, W. S. Lyle, Morris Hoeflich and H. Zadig, trustees.

Secretary Holmes presented his report for the year ending December 14th, which is as follows: Receipts—Cash on hand December 15, 1887, \$17,701.94; superintendent's balance account, \$160.89; assessments, \$50,400; ores, \$9594.08; hoisting, \$120 76; compressed air, \$3458.21; total, \$92,635.88. Disbursements—Insurance, \$1606.50; assaying, \$631.50; surveying, \$15; taxes, \$655.21; salaries and wages at mine, \$31,799; incidental, \$352; office expenses, Virginia, \$911.35; supplies and miscellaneous expenses, \$22,162.36; freight and hauling, \$707.72; office expenses, San Francisco, \$6256; team account, \$143 66; legal expenses, \$415 96; interest and exchange, \$227.24; water rent, \$1200; superintendent's balance account, \$335.99; total, \$67,429. Cash on hand \$25,206.39.

At a meeting of the directors of the Silver Hill Mining Company, held in this city, A. C. Hamilton was appointed superintendent and instructed to resume operations in the mine forthwith. It is claimed that ore assaying \$35 a ton was cut in sinking the shaft, and this is to be explored to ascertain its extent. The Silver Hill has a fine steam hoist and pump plant and a building over the shaft. The shaft is thought to be in fair condition down to the 600 level.

The following officers were elected at the annual meeting of the Gould and Curry M. Co.: President, Geo. R. Wells; Vice-President, Chas. H. Fish; Trustees, George Frier, Morris Hoeflich, Robert Sherwood, Herman Zadig and Joseph Marks. A. K. Durbrow was re-elected Secretary and Patrick Kerwin Superintendent.

The Secretary's financial statement was as follows: Receipts—Cost balance, as per statement December 19, 1887, \$25,901 67; assessments Nos. 57, 58 59 and 60, \$145,554.50; mine account, \$39,729.34; haulion account, \$58,116.66; total, \$269,302 17. Disbursements—Mines supplies, \$60,238.26; labor and salaries, \$125,131.38; water, \$2421 20; surveying, \$300; assaying, \$3267 01; G. and O. B. and B. joint shaft, one-half expenses, \$2254.15; Virginia office expenses, \$543 16; team expenses, \$262 50; hauling, \$2230.03; general office expenses, "San Francisco," \$2380 85; stationery and printing, \$227 80; advertising, net expense, \$805.90; traveling expense, \$140; exchange, \$719; interest, \$362.25; taxes, \$408.34; legal expenses, \$492.21; insurance, \$630; sluice tunnel, \$20,909.27; real estate, "Virginia," \$21 50; milling ore, \$23,923.55; royalty Sutro Tunnel, \$4298.65; freight on haulion, \$174.95; discount on haulion, \$11,931.30; total, \$264,072 37. Balance cash on hand, \$5229.80. Total, \$269,302.17.

The Superintendent's annual report says: There has been extracted from the 425, 300, 250 and Drain Tunnel levels 3417 1300-2000 tons of ore, which has been milled by the Douglas mill at a cost of \$17 per ton, and yielded bullion of a total assay value of \$56,134.41, which shows an average yield of \$16.42 per ton. This bullion carried 17,180.36 in gold and \$38,954.05 in silver. There has also been sold to Thomas Halley 881 tons of second-class ore at \$2.25 per ton.

The Mount Diablo M. Co. has elected the following officers: Pres., W. E. Norwood; Vice-Pres., J. M. Shotwell and J. N. Knowles; G. W. Grayson and R. W. Heath, Trustees. R. W. Heath was re-elected Sec'y and W. H. Shockley, Supt.

The secretary's financial report is as follows: Receipts—1887—Dec. 15th, cash on hand, \$2468.81; gross bullion, \$405,754.72; total, \$411,223.53. Disbursements—Mine labor, \$76,441.49; fuel for mine, \$3403.88; mine machinery, \$791.75; water for mine, \$3000; lumber, \$686.60; mine supplies, \$4306.61; freight at mine, \$2439.06; general expenses of mine, \$1783 33; mill labor, \$35,152.50; lumber for mill, \$709.67; water for mill, \$600; freight at mill, \$3116.72; mill machinery, \$2745 57; fuel for mill, \$33,585 95; salt for mill, \$6858.37; mill supplies, \$9051.72; general expense at mill, \$1290.77; transportation of ores, \$15,793 09; taxes, real estate and bullion, \$4932.97; insurance, \$1889.15; disbursements, San Francisco office, \$5430.93; dividends 8, 9, 10, 11, \$40,000; bullion discount, \$107,740.11; express charges on bullion, \$3580 15; charges for refining bullion, \$3491.72; custom ores, \$12,538.36; gross bullion unsold, \$15,244.96. Dec. 11, 1888, cash on hand, \$9568.40; total, \$411,223.53.

The bullion report shows the total amount of

bullion shipped to be \$410,239.89. Less bullion from 154 tons of custom ore, \$20,762.72. Bullion shipped from Mount Diablo ore, \$389,477.17. Tons Mount Diablo ore crushed, \$211. Average battery assay, \$51.78. Percentage of moisture in ore, 7.25. Percentage of salt added, 11.13. Moisture in salt, 7. Assay of ore as shipped from mine, \$53.38. Percentage of silver extracted, 88.8. As an cleanup has been made in the mill, the actual percentage of silver extracted is more than is shown by the above figures, and is probably from one to two per cent higher.

At the annual meeting of the stockholders of

J. E. Hawkins secretary, and Butler Burris assistant secretary. The superintendent of the mine has not yet been appointed. The company is in good financial condition, having a cash balance on hand amounting to \$19,084.53.

COSTLY ROLLING STOCK.—In the past 16 months about \$5,000,000 has been spent by the Southern Pacific Company to equip its railroad system with new cars and locomotives. This is the largest amount of varied rolling stock ever contracted for by any railroad corporation within so short a time. All the contracts were

The Children's Playground.

That was a glad day for the city children when it was decided to expend the bequest of \$50,000 by the late William Sharon, in making a spacious playground in Golden Gate Park. The site selected for the playground, which will always be remembered as "Sharon's Quarter," is in a little valley about 1300 feet wide and 800 feet long, located due west from the terminus of the Haight-street cable line. The valley has been filled to an average depth of about four feet with material taken from a

A DUN GLEN GOLD MINE.—Nearly three years ago James Hendra and Richard Eva located a quartz-mining claim in the Dun Glen mountains about a mile and a half from the village. Both being experienced miners, they went to work to develop the claim systematically. They first ascertained by development the course and dip of the lead and then ran a tunnel which cut the ledge at a depth of 60 feet. In this tunnel the lead is from 4 to 7 feet wide and it carries from \$15 to \$25 per ton in gold. Subsequently they ran a second tunnel, which cut the lead over 100 feet below the surface. In a drift run on this level the ledge

THE SHARON HOUSE AND PARTIAL VIEW OF THE CHILDREN'S PLAYGROUND, GOLDEN GATE PARK, SAN FRANCISCO.

the Locomotive M. Co., the following gentlemen were elected officers for the ensuing year: President, H. B. Havens; vice-president, T. F. Fish; and L. C. Fraser, David Hunter and A. H. Fish, directors. A. H. Fish was re-elected secretary and I. D. Smith, superintendent. The secretary's report showed a balance of \$2739.39 cash on hand.

The control of the Andes Mining Co. changed hands at the annual meeting of the stockholders. John Landers, who has been connected with this company since its organization, retired from the position of president and general manager.

At the meeting the number of shares represented was 91,885, which were all voted for the following directors: J. W. Brown, W. S. Lyle, M. P. Hall, Walter Turnbull and M. W. Fox. At a subsequent meeting, J. W. Brown was appointed president, M. W. Fox vice-president, James

made by C. P. Huntington, and received his personal supervision. Most of the new rolling stock has been delivered. A reporter asked General Superintendent Fillmore to explain the character of the contracts for the rolling stock. He said that 180 locomotives had been bought for an average sum of \$10,000 apiece, some 40 sleeping cars for \$14,000 each, 75 passenger coaches that cost \$5000 each, between 2500 and 3000 box and flat cars, the former costing \$600 apiece and the latter \$400 each, also a number of tourist, baggage, mail and express cars that cost \$75,000 in the aggregate.

It is stated that a party of New Orleans capitalists have bought the Clark and Anderson group of mines in the Planchas de Plata district, 20 miles southeast of Nogales, in Sonora. The property is considered about the finest mining property in the State of Sonora.

small mound near the valley. It is spacious enough to accommodate 5000 or more romping children. Here are music-stands, lawns for tennis and baseball, swings, and a picnic-ground composed of latticed arbors, with many sunny nooks and warm, sheltered corners. At the west end of the playground is a large dairy building, where milk, cream and eggs will be furnished the little ones at cost price. Our picture gives a very good idea of this beneficent and delightful place.

DETECTING ACIDS IN OIL.—Acids in lubricating oils may be detected by analysis in a laboratory, or by putting the sample to be tested in a clear glass bottle with a copper wire running down through the cork, air-tight; stand the whole in a sunny place for two or three weeks, and then, on removal, if verdigris or green rust appear on the copper, an acid is in the oil.

has widened from a foot and a half to four feet, and the ore assays from \$20 to \$30 in gold and from \$15 to \$23 in silver to the ton. They now have plenty of ore in sight and excellent prospects for one of the largest and richest gold-bearing claims ever developed in this part of Nevada.—*Silver State.*

PATRICK HAMILTON, a well-known pioneer citizen and journalist of Arizona, died at Phoenix on the 20th inst. He was a member of the tenth session of the Legislature, and was Sergeant-at-Arms of the eleventh session, which appointed him Commissioner of Immigration. Governor Tritle subsequently reappointed him for four years, and to his indomitable efforts in behalf of Arizona much of its present prosperity is due. His "Resources of Arizona" is to this date read with much interest throughout the Eastern States.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ALPI.—*Ledger*, Dec. 22: Last Wednesday, in company with Col. W. T. Robinson, we paid a visit to this property. It is located half a mile east of the Moore mine. The croppings are very strongly marked, a huge mass of quartz at least ten feet wide projecting from the surface for several hundred feet. It is an immense wall of quartz, many thousands of tons being exposed by the cropping. There is also two feet of gouge matter on the west side. There has been no development-work done upon the property worth speaking of. A shaft at the north end of the croppings has been sunk 50 feet on the ledge, from which 100 tons or so of quartz has been accumulated on the dump. At the south end the ledge has been quarried out 15 feet deep, throwing up another large pile of quartz. These two workings are about 500 feet apart, and the croppings are distinctly marked all the way between and for some distance beyond them. There is no question about the rock being there in quantities sufficient to satisfy the jaws of a 40-stamp mill. The only point that remains to be solved is: Will the rock pay? We are told that ore from the Alpi ledge crushed many years ago yielded \$3 per ton in free gold. From the favorable conditions of working, if it paid \$2 per ton throughout it would with present means of working leave a handsome margin of profit.

AMADOR GOLD MINE.—*Dispatch*, Dec. 22: Everything is progressing in good shape at this mine. In two weeks the connection will be made between the west shaft and the 250-foot level. At the mill the mortars and cam shaft are set, the battery painted, and the water-wheels placed in position.

GRAINGER.—This prospect is located near Pine Grove, and is owned by Silas Grainger, formerly of Jackson. A shaft has been sunk 80 feet on the ledge which is small, yet quite rich. About 20 tons of ore, taken from the shaft, was crushed some time since and yielded at the rate of \$25 per ton. A level has since been run from the bottom of the shaft, and a trial will soon be made of rock taken from the face of the tunnel.

COSMOPOLITAN.—The east crosscut is in 100 feet, 10-foot ore, and not yet to hanging-wall. The south drift is in 12 feet.

NORTH CALIFORNIA.—They are taking out ore from the west crosscut in this mine; have been cleaning out the Potosi ditch. The mill will be started up next week. Mr. Goodman has his Huntington mill in operation again, at the Overplus mine.

DRYTOWN CON.—This enterprise is being pushed right along. It is expected to begin work the first week in January. Three thousand feet of 10-inch pipe has been engaged; also a water hoist, same as that used at the North Star in Sutter creek. Geo. Phillips has started his gravel mine at Irish Hill; six men are employed. The water used is taken from the Plymouth ditch, and the debris goes into Buckeye valley; hence he is not subject to injunction by Sacramento river people.

NORTH STAR.—At this mine they are preparing to sink a winze on the ledge from the tunnel running south, as they are of the opinion that they are on top of the ledge. Seven-ninths of the original stockholders have signed an extension of the bond on the mine to the company; the other two-ninths refuse to extend.

WILDMAN.—At this mine they have developed a ledge of excellent ore, and intend sinking 100 feet deeper on same at once, and increase their mill to 20 stamps. At the Lincoln, work in the tunnel over the old shaft is progressing rapidly. The mill is kept running steadily now. Reports from the Stewart mine, up the creek, are very flattering; in fact, reports give it the flavor of a bonanza. The new mill has been started, and everything is working finely.

Calaveras.

RICH GULCH.—*Cor. Calaveras Chronicle*, Dec. 17: The Atwood is running in full blast, and has a force of about 50 men. The grading is about completed and a 20-stamp mill will soon be erected. A ten-stamp mill is being erected at the McGlew mine, also a boarding-house. They have about 15 men employed at present, but they intend increasing the number in a short time. The Ilex mine is closed down, but will start up again about the first of next month.

SOAP ROOT MINE.—*Calaveras Chronicle*, Dec. 22: This mine, situated in the West Point district, is undergoing development without intermission, preparatory to stopping. The south level is being run in order to tap the central chute. When this level is completed an upraise will be started in the end of the ore body, which is valued at \$200 per ton; thence the level will be continued to strike the Henry chute and an upraise effected at that point. At the same time a north level will be run, extending 100 feet, opening the north chute. The main hoisting shaft, which is 100 feet in depth, is centrally located to work the three chutes, it lying between the two on the north and being favorably located for the convenient working of machinery and the erection of buildings. There is a building 80x40 on the mine, and the combined power of a steam engine and water-wheel is used for pumping and hoisting. The mine is making a splendid showing at present.

RICH ROCK.—Edward Zumwalt and Leon Vandel, owners of the Victor mine on Esperanza creek, where they have been prospecting for the past year, have struck some rich ore. They have constructed an arastra which has been in operation for awhile, and the results have shown that they have been putting through rock yielding \$150 per ton.

EL TRIUNFO MINE.—This property is situated on Bear creek and is owned by parties in West Point. Operations will be resumed on it in the near future. This mine will prove to be a paying one when once opened, as present developments plainly show. It is favorably located to work by water-power, which fact adds greatly to its value.

El Dorado.

VOLCANOVILLE.—*Cor. Georgetown Gazette*, Dec. 20: The Fairchild at Mt. Gregory, owned by the Barklage Bros. and leased to Messrs. Brown, Ken-

ney & Stanton, will commence operations in a few days.

OLD BALLARD CLAIM.—This property adjoins the Mount Hope and will be operated this winter by Messrs. Kates, Knowlton & Co., who have made extensive preparations to fully open up what is considered a very valuable piece of property.

COOLEY CLAIM.—This is leased by Judge Edmondson and St. Clair Nye and has a very encouraging outlook. The work now in progress shows evidence of opening up a valuable claim in the very near future.

JOSEPHINE.—Both mine and mill are in full blast, giving employment to numerous men, and undoubtedly is paying the proprietors handsomely for the large investments of capital made to develop this valuable property.

MCCALL MINE.—On middle fork of American river. Over a dozen men are employed on this claim, and as soon as accommodations are complete the intentions are to increase the number. Day and night shifts are working at present.

GEN. HARRISON.—Situated on the south side of Buckeye hill, owned by R. & Austin Fairbanks, who are making ample preparations for extensive work when water is obtainable. Prospects are very encouraging for a profitable season's work.

FLORA MINE.—On this claim the lessees, Knox & Borella, are running a tunnel to strike a crevice which is expected to develop into a paying prospect. They are now using the waste water from the Josephine mill for prospecting purposes.

BONANZA CLAIM.—Located on the south side of the middle fork of American river. Is being worked by a company of capitalists who have a number of men employed in preparing for extensive work this winter, with very flattering prospects.

COCK ROBIN POINT MINE.—This property is owned by Thomas Natrass and Sacramento parties, who have expended during the past summer a considerable amount of money for the proper development of what is considered one of the most valuable claims in this section. Active operations will commence on the claim shortly, and under the experienced eye of Mr. Natrass bids fair to reimburse the owners for their outlay and leave them a handsome profit at the close of the season.

LAST CHANCE MINE AND MILL.—Under very unfavorable circumstances, lack of water being the principal drawback, a small quantity of quartz was run through the mill, showing very favorable results. With some needed alterations to machinery there is little doubt that a still better showing can be obtained. At present, the owners, Kane & Creagh, are undecided as to future operations on the property. Judging from the renewed activity this season, to be seen on every hand, the outlook in mining is more than encouraging.

Fresno.

A PROSPEROUS CAMP.—*Fresno Expositor*, Dec. 19: A. B. Chambers, an experienced prospector, assayer and miner, formerly of Tombstone district, Arizona, came to Fresno this summer, and was induced to visit the mining regions of the Upper San Joaquin in this county. A few weeks' search disclosed to him a find which promises to eclipse anything yet discovered in the southern Sierras. On Temperance Flat, about 35 miles northeast from here, he has a two-foot vein of auriferous ore that shows the gold thickly interspersed throughout the quartz. Both foot and hanging-walls are as perfectly defined as if shaped with trowel and float. Some specimens we have seen are of great richness, and Mr. Chambers assures us that the samples shown are but a fair average. A third interest was sold yesterday to J. G. Denning of San Francisco, one of the principal owners in the Fresno Milling Co., and a mill will be put on the property early in the spring. This claim is about a mile distant from the mill of A. Jackson, erected this season, and which has been pounding away on the quartz for two weeks past. The output of mineral from the mill is most satisfactory, and Mr. Jackson is enthusiastic about the outlook.

HILDRETH.—*Cor. Fresno Expositor*, Dec. 19: The Abbey mine is looking better than at any time during the past year. The drift on the 700-level is being driven ahead with all possible speed, disclosing a splendid body of high-grade ore, which from present indications promises to be one of the most valuable ore bodies ever discovered in the Abbey, from the fact that it seems to be a continuation of the immense ore chute on the tunnel level. The face of the main tunnel is also in rich ore, and the first level is looking fine. The stopes above the tunnel level are looking better at some points than they did two weeks ago, but will soon be exhausted, owing to the near approach to the surface. The Frances and James has been closed down indefinitely, causing considerable depression in business matters generally. The Jackson is working a small force of men. The Lillie has not resumed operations as yet, so the camp is mainly dependent on the Abbey, and there is only a small force employed by this company at present.

Inyo.

THE SODA INDUSTRY.—*Inyo Independent*, Dec. 22: At the soda works, at Keeler, 2000 tons of crude soda are now ready for purifying. Of this, 20 per cent, or 400 tons, will be bicarbonate of soda, worth \$70 per ton. The other constituents are worth \$30 per ton. The whole will therefore be worth \$76,000. The purifying is done by a process discovered and patented by Mr. B. F. Gray, superintendent of the works. This process is much more effective and cheaper than the old way of working. The force of men employed has recently been reduced; 21 men are now at work, but many more will be employed next spring. A great deal of work had to be done making tanks for purifying the soda; this is now nearly finished and purifying will begin in a few days. Thirty tons a day will be purified. The source of supply is Owens lake, and is inexhaustible. The business will certainly grow to large proportions and be of immense value.

Monterey.

LOS BURROS DISTRICT.—*Cor. Monterey Democrat*, Dec. 14: The Lost Child claim has run two tunnels and has also fine ore that turns out well. They are running a tunnel on the Fir Tree claim, also on the Little Ridge claim. Those two claims lie alongside of the Brewery claim, that a short time ago struck it so rich, and are now putting up a building for the purpose of working the claim for all it is worth in the spring. The Melville claim

has a tunnel run in about 90 feet, and is now getting out timber to push the tunnel ahead. There has been considerable work on the Oakland. On the Bushnell claim they are running a tunnel and have struck a small vein in slate that prospects. They also find considerable gold in the gulch, among which are some good-sized nuggets. The Cruikshank or Last Chance Mining Co. have about 200 tons of ore on the dump, and are running their mill night and day. They are drifting from their main tunnel on a 6½-foot ledge, from which they are taking out very rich ore. They are also pushing the tunnel ahead to strike another vein from which they have taken out rich ore on the surface of the ground. It would be well for some of the "pinch out" men to come and see the vein in the tunnel.

Los Angeles.

OIL.—*Newhall Times*, Dec. 22: There are 22 men now at work on the grade for well No. 7, at the Wyile. This promises to be a pretty rich oil section. No. 6 is now down a little over 400 feet; oil was struck at 400 feet, with indications for a splendid flow.

Nevada.

NORTH STAR MINE.—*Grass Valley Union*, Dec. 19: The ten new stamps in the North Star mill were started up on Monday for regular work, making the total crushing capacity of the mill 40 stamps. The increase in the number of stamps was rendered necessary by the large amount of ore the mine is producing, and which had accumulated to such an extent that it was found necessary to lay off a number of the men. The tribute rock had also largely accumulated so that 30 stamps could not dispose of it together with the company rock. The full head of 40 stamps will enable the mill to reduce 80 tons of ore per diem, and permit of more extensive exploitation of the mine, which is paying handsomely, and is good for large dividends. The main incline is now being sunk for the 19th level, which shows the energy which has been displayed by the company, which, since operating the mine, has sunk the incline from the 12th level to its present depth. The vein in the shaft is strong and of good milling quality. The plant on the North Star is not surpassed by that of any mine in the State in perfection of its machinery and convenience in manipulating the ores. To all appearances the mine has a long and profitable life before it.

IDAHO MINING CO.—The annual meeting of the Idaho Mining Co. was held on Monday evening, at which the reports of the officers of the operations of the Co. for the past year were submitted and a Board of five Directors was elected to serve for the ensuing year. The old board was re-elected consisting of John C. Coleman, Edward Coleman, M. P. O'Connor, E. C. Creller, and Geo. W. Hill. The board organized by the election of Edward Coleman as President and Superintendent; E. C. Creller, Vice-President; John C. Coleman, Treasurer; Geo. W. Hill, Secretary. The reports of the officers of the company have not been given out for publication, but it is understood that the product of the mine has been up to the usual average, and the dividends for the past year have amounted to about \$300,000. The mine continues to look well, and is yielding ore from the 13th to the 16th levels inclusive.

THE DELHI MINE.—*Grass Valley Union*, Dec. 22: Robert McMurray, who is the principal owner in the Delhi quartz mine, near Columbia Hill, was in town yesterday and said that recently very rich quartz had been struck in the lower tunnel of the mine, nearly every piece showing liberally in free gold. The width of the pay shoot on this level has not yet been determined, but if found to be as wide as on the level above it will add immensely to the value of the mine. The new find has doubled the product of the mine, which was previously large and profitable. Besides the quartz being rich in free gold, the sulphurets are of high grade, yielding an average of \$200 per ton. The sulphurets saved last month were alone of the value of \$70,000. The mine is worked cheaply, as it is opened by means of tunnels driven into the face of the hill at different elevations, thus securing drainage without pumping, and the milling is done by water-power, which is ample for all purposes and cheap. As an evidence of the high grade of the quartz and the profitable working of the mine, Mr. McMurray said out of a yield of \$250,000 taken out within a stated time dividends of \$210,000 were paid, and that whatever might be the future of the mine it has been a very profitable property to the company. The owners in the Delhi are also interested in the Enterprise, which is showing up well and has given profitable crushings, and to all appearance is going to be a successful rival to the Delhi. These quartz operations are encouraging to the Columbia Hill region, and will serve to stimulate energetic prospecting and give encouragement that other valuable mines will be opened up.

ABOUT COMPLETED.—*Grass Valley Union*, Dec. 23: The additional stamps at the North Star mine are now running, and save a few tightenings of screws, a little fixing of bearings, they are now all in running order. Mr. J. H. Gates has been superintending the work for J. B. White & Co., sub-contractors, of San Francisco, and he has done his work well. Mr. Gates has placed the stamps and all their surroundings just in the right shape, and has proved himself a master of his profession. The batteries, Frue concentrators, etc., are all in line, and the job is a successful one.

Placer.

THE PIONEER MILL.—*Grass Valley Union*, Dec. 20: The 20-stamp mill which is being built by Wm. S. May of this place on the Pioneer mine, at Humboldt canyon, will be completed and in running order in about two weeks. It has been a big job to build this mill, as the place is difficult of access for teams, and a large part of the machinery had to be taken there from Alta by pack trains, and the supplies for the workmen were carried by the same route. The Pioneer is a master lode, being 14 feet between walls, and yields a great deal of high-grade free-milling ore. The lode has been penetrated at several points by tunnels, and the ore can be run out by tramway on cars directly to the mill. A good deal of development-work has been done on the mine, and the mill will have a large supply of ore to commence on. The owners of the Pioneer are Jas. G. Fair and A. E. Davis of San Francisco, who have in this mine what is believed to be a great property. The present mill is said to be only a commencement in the way of milling facilities, and probably next season from 40 to 60

stamps more will be added. The owners intend working the mine on a large scale.

HOGSBACK.—*Placer Republican*, Dec. 14: W. C. Ralston, superintendent of the Hogsback mine, went to Georgetown to-day to secure an extension of the bond on the mine for 60 days. The tunnel has been pushed ahead, and at a distance of 173 feet from the point where it entered the mine, ran into gravel. This continued for 43 feet, when to the surprise of all it has broken through into another body of cement. Two shafts are being sunk to find the channel.

RED POINT.—The output at the Red Point mine this month will be at least 500 ounces, and the company will declare its first dividend in Paris on Christmas Day. The dividend will probably be small, but it is a pretty good showing for a new mine, and all from development work at that.

MORNING STAR.—During the last four months Morning Star mine, near Iowa Hill, cleaned up over \$8600 at an expense of about \$1700. The gravel crushed was taken out in development work.

San Diego.

ESCONDIDO GOLD MINE.—*San Diego Times*, Dec. 19: For the past six weeks A. K. Cravat, president of the company, has devoted most of his time to superintending the work. He has eight men at work, all except one having an interest in the company, and who have unbounded faith in the enterprise. They struck some rich pockets last week, and were greatly encouraged. No matter in what direction they work, or drift, the vein shows up distinctly and is well defined. There is no pinching out, and it shows the best results below or at the water-line; for this reason they are anxious to get some new machinery, in order to pump the water out, that they may go down with the main shaft. This week they have shipped a car of ore to the National City Reduction Works to be milled.

Shasta.

CLEANUP.—*Redding Free Press*, Dec. 19: I. M. Wiley, who is down from Delta, informs us that the Murray-Finley Co. cleaned up about \$1500 from a ten-days' run with an arastra. He also states that a new discovery has been made, in which he is interested, which promises to be very rich. This portion of Shasta county, including the Soda creek mines, seems to be turning out quite well.

Sierra.

PROMISING.—*Nevada Transcript*, Dec. 20: F. A. Gourley, who came down two days ago from Sierra county, says that the two quartz ledges ten miles from Gibsonville, in which R. E. Robinson, formerly of this city, holds a sixth interest, are panning out most satisfactorily. The veins are large, and the bulk of the ore pays about \$15 a ton, while the good-sized strata of sulphuret ore that yields \$200 a ton. Mrs. Robinson, who went up there a few weeks ago, is conducting the company boarding-house and making money at it.

GOLD BLUFF.—*Mountain Messenger*, Dec. 22: Work at Gold Bluff has pretty much ceased for the winter. A few men will be kept at work, it is said.

Plumas.

SPANISH RANCH.—*Cor. Plumas National*, Dec. 17: The Edman mine is doing well. Mr. Edman is about to put up a new mill at his place. This is the model mine of Plumas. Mr. Abe Bolyar, of the Bolyar mine, has run a new tunnel into the channel. Although it cost a good round sum of money, he is now realizing handsomely upon his investment. Mat Knielvel has struck good pay in his Summit mine. Challen & Sons are running a long tunnel into the mountain at Sharp's ravine. They expect to strike gravel this winter. Messrs. Wampler and Hickman, south of Challen's mine, are in 500 feet in their bedrock tunnel. The bedrock is very hard and it will cost the boys a mint of money. They expect to strike gravel any day.

NEVADA.

Washoe District.

CROWN POINT.—*Virginia Enterprise*, Dec. 22: No. 3 crosscut, 700 level, is in 26 feet. The face is in porphyry, clay and streaks of quartz. The 700 raise is up 45 feet above the track. The top of the raise is in good ore. The 800 level east crosscut No. 1 is in 40 feet. Ten feet from the face we passed through a clay wall two feet thick, standing vertical and running northeast and southwest. Since then the drift has been in quartz giving good assays.

CON. IMPERIAL.—East crosscut No. 1 is out a distance of 57 feet from the main north lateral drift, having been advanced 12 feet during the week. The face continues in vein material of no value.

CHALLENGE CON.—The Joint Confidence raise from the 1300 level to connect with the 1200 level is now up 22 feet, having been advanced eight feet during the week. The top of this raise shows some ore of fair quality. Have shipped during the week to the Brunswick mill for reduction 113 tons of ore, the average battery sample of which shows a value of \$25.49 per ton.

BELCHER.—Have now repaired and cleaned out 195 feet of the 1100 level north drift. The joint 1100 south drift advanced 56 feet during the week and is now out 195 feet.

SEG. BELCHER.—The joint 1100 south drift is now out 195 feet, having advanced 56 feet during the week, or at the rate of 8 feet per day. There are still 120 feet separating the face of the drift from the Segregated Belcher and Mides north line.

CONFIDENCE.—Have shipped during the week to the Brunswick mill for reduction 518 tons of ore, the average battery sample of which shows a value of \$25.49 per ton.

JUSTICE.—The raise from the north drift is up 32 feet. The top of the raise is in five feet in width of good ore. The west drift was advanced 18 feet during the week, and is now out 216 feet. Are still cutting out the 370 level shaft station.

WEST COMSTOCK.—The West Comstock Mining Co. has struck some rich ore 200 feet from the surface. From two assays taken from the ledge, No. 1 went \$43.40 in silver and \$35.10 in gold, and No. 2 went \$75.10 in silver and \$35.10 in gold. The mine is under the charge of Andrew Bean, an old-time miner of the Comstock.

SAVAGE.—On the 500 level the west drift from the station was extended 32 feet; total length, 312 feet. Are extracting ore from east crosscut No. 1 and from

the old stopes on this level. Are also extracting ore from east crosscuts Nos. 2 and 3 on the 600 level, and from the old stopes on the 750 level. During the week hoisted 336 tons of ore and shipped to the Rock Point mill 481 tons, and have reduced 470 tons. The average battery assay of the same was \$19.50 per ton. Have bullion at the mill amounting to \$11,923.17.

BULLION.—The winze below the 640 level has been sunk 54 feet. The machinery is running well.

YELLOW JACKET.—Are doing good prospecting work in different parts of the mine, and are shipping daily 100 tons of gold ore to the Santiago mill, which yields better returns than formerly.

SCORPION.—The west crosscut on the 300 level is out 335 feet.

ANDES.—The usual progress is making on the 240 and 350 levels.

SCORPION.—The usual amount of prospecting work is in progress.

HALE & NORCROSS.—On the 500 level the main west drift was extended 25 feet, its total length from the shaft being 680 feet. This drift continues in the same good quality of ore mentioned in the last report, which are stopping and sending to the mill. On the 600 level the west drift was extended 30 feet; total length from the chute, 105 feet. On the 800 level the northeast crosscut from the face of the north drift was extended 39 feet; total length, 55 feet; and the southeast crosscut from the south drift was extended 20 feet; total length, 70 feet. Are extracting ore from the stopes between the 500 and 700 levels, which continues to yield the usual quantity of good ore. During the week have hoisted 1024 tons of pay-ore from the 500 and 700 levels, and have shipped to the Mexican mill 898 tons. Average battery assay, \$28.18 per ton. Have bullion on hand and previously shipped for the month amounting to \$41,534.72.

GOULD & CURRY.—200 level: In the north drift, at a point 104 feet from west crosscut No. 1, west crosscut No. 2 has been advanced 30 feet. Formation porphyry with streaks of quartz.

ALPHA.—The north lateral drift on the 500 level is still in clay and quartz. The south lateral drift is in ore that assays from \$15 to \$20 a ton.

POTOSI.—The south drift on the 650 level is still being advanced in clay and porphyry.

CHOLLAR.—The raise from the 650 level north drift is in quartz showing value. On the 750 and 850 levels the west drifts are still in clay and quartz. Half the Nevada mill is being run on Chollar ore, the machinery being run by the surface Pelton water-wheels. Electricians are at work trying to transmit the power generated by six Pelton water-wheels on the 1600 level of the Chollar shaft to the Nevada mill.

ALTA.—Started the mill Thursday, running the pulp over two concentrators before amalgamation, and it works well, so far as can be determined at this early date.

Pioche District.

BUSINESS REVIVAL.—*Record*, Dec. 15: Since the arrival of W. S. Godbe there has been an activity noticeable in the way of preparations for future mining and reduction operations that cannot be otherwise than gratifying to the long-waiting Pioche public. We learn that it is the intention of the P. C. Company to proceed at once with the erection of a roasting and dry concentrating plant, in connection with its present leaching works, the tanks of which are to be lined with sheet lead, and the works otherwise got in readiness for the treatment of ores. We also understand that arrangements have been completed whereby the R. & E. mine is to be started up in the near future; the work of retimbering the shaft will soon begin. The large bodies of ore in this mine from what is known as the black ledge can be treated in the proposed works to advantage; the galena and zinc blende can be separated from the gangue and worked separately, as they should be. When this is done, it will be but a stepping-stone, as it were, to other and even more important developments.

Oseola District.

PLACERS.—*Eureka Sentinel*, Dec. 15: The placer mines of Oseola are still being successfully worked. On the mountain, on the slope of which these gravel diggings are situated, are two or three immense veins, which show a good milling average in free gold. Some enormously rich pockets will undoubtedly be found in these veins when they come to be systematically worked. In the placer diggings, a little below, they a few years ago found a mass of quartz that contained over \$5000 in pure gold.

Silver Peak District.

CLOSED DOWN.—*Walker Lake Bulletin*, Dec. 19: The Silver Peak mines have been closed down for the winter. Messrs. Brunton & Taylor, managers, and J. W. Moffat, civil engineer, passed through en route to Denver on Saturday. Mr. Brunton will cross the Atlantic and report progress to the owners, and is confident that work will be resumed with renewed vigor in the early spring.

ARIZONA.

ORE SHIPMENT.—*Clifton Clarion*, Dec. 19: Jenkins & Paxton shipped this morning from the Pittsburgh claim, owned by Grant, Baxter, Whittington & Adams, 324 sacks of ore consigned to sampling works in Colorado. It is claimed the rock will run \$100 and upward.

COPPER.—In copper properties also an active interest is being taken in the district. We are informed that the well-known Carrasco group of mines near Morenci have been sold for \$10,000 cash, and that payment will be made within the next ten days. The purchasers are New York parties, who certainly have got hold of an excellent property, and one which for some time past has been a steady producer of an excellent quality of ore. It is further said that negotiations are pending for the purchase of the Higby group of mines, also in the vicinity of Morenci. It is claimed they are now in a condition to produce a large and unknown quantity of high-grade ore of a most desirable quality—carbonates.

VARIOUS CAMPS.—*Prescott Journal-Miner*, Dec. 13: Biglow & Smith are doing assessment work on a claim in Maple gulch. N. Johnson, a placer miner on the Hassayampa, brought in several dollars worth of gold dust yesterday. Shull & Austin have a six-horse team regularly employed in transporting

supplies to the Congress mine, making a round trip every six days. J. M. W. Moore has been appointed general manager of the sampling works of the Arizona Ore Co. Reports from the Centennial district say that Harry Watton has made a wonderfully rich strike about four miles from Centennial camp. It is said to be a large ledge of free gold. Dan Hatz has nearly a carload of ore ready for shipment from the Ruby and Buena Vista mines on Slate creek. The ore contains gold, silver and copper, and runs from \$80 to \$100 per ton. Six or eight teams of from six to twelve animals each, pulled out to-day loaded with mining machinery. Among the number were several bored for the Oro Bella company's camp in the Bradshaws. Ed Wager has recently struck some horn silver on his El Dorado mine at Tip Top. The El Dorado has been worked for a number of years, and is now paying better than at any time before. W. A. Rowe has a pack train engaged in packing ore from the Original Davis mine on Slate creek to Prescott, for shipment to Colorado smelters. Ore works from \$80 to \$100 per ton, and he has 20 tons out ready for shipment. John McDermid has taken a contract for running a tunnel 100 feet in the Storm Cloud mine, and Thomas Williams and J. Brown have taken a contract for sinking a 70-foot shaft on the same property. Fred Sattes was in from the Alligator mine yesterday, for supplies. This mine is opening up into a veritable bonanza. It has already produced several thousand dollars in gold, and there is as much in sight now as has been taken from it. Twelve men are now employed on the Storm Cloud, and the work of developing this and other properties adjacent, owned by the same company, will be pushed rapidly, and it is the intention to erect a mill for the reduction of the ores in the spring. A superstition exists among many miners that a year ending with nine is a successful and prosperous one for that industry. Whether the omen is a good one or not, the mining outlook for this section never looked so favorable as it does at the present time for the year 1889.

COPPER BULLION.—*Florence Enterprise*, Dec. 15: From Mr. E. W. Haskin it is learned that the first carload of copper and matte sent forward by the Atlas Mining Co. of Red Rock, left that station last Saturday for New York City. The shipment weighed 33,000 pounds, and the copper was about 95 fine, carrying about 36 ounces of silver and \$4 in gold to the ton; the matte was 75 fine, carrying 40 ounces silver and \$7 gold per ton. Another carload of matte—about 35,000 pounds—was also shipped on Thursday of this week, and the regular shipments will follow. The shaft on the Caledonia mine, 477, 60 feet deep, is all the way down in good smelting ore. About 20 men are employed in the mine and at the furnace. The company expect to build a large furnace of 125 tons capacity, in a short time. A portion of the material has already been ordered in San Francisco.

SILVER KING NOTES.—Considerable assessment work is being done on some of the claims in this vicinity, which is a strong indication that there is no lack of faith in the future prosperity of this corner of the county. The contract for the work on the South King Co.'s claims has been secured by Col. Robt. Williams and the work will be pushed to completion as speedily as possible. The excitement in this end of the county this week is in Final and immediate neighborhood. The parties who held the bond on the Blackbird mine are in Final and it is rumored for the purpose of making the final arrangements concerning the transfer of this property. From all accounts the mine is a valuable piece of property. R. T. O'Donnell, P. C. Cumerford and Nelson Walker each paid a visit to Reymert camp this week, and from all accounts affairs are prosperous there.

COLORADO.

CRESTED BUTTE.—*Elk Mountain Pilot*, Dec. 20: We are very strongly of the opinion that next summer we will witness a revival in mining never before experienced in this section. We had a boom in 1880, but that was a tenderfoot boom. Foolhardy people rushed in here and frantically threw their money into holes in the ground, and because it did not yield to them millions, so to speak, they rushed out and cried mining is a fraud in general and more particularly in Gunnison county. It takes a long time for any country to recover from such inflated and overrated tendency, but we are thankful to know that recovering we are, and right fast, too. The outcrop is here, and the veins and ledges just as strong or stronger than can be found in any mining locality. The Great Eastern lode in Irwin is showing up well; it is being worked under a lease by Henry Panter. This claim is east and parallel with the Forest Queen mine, and something remarkable. It is a very dry mine. Mr. Panter has sunk a new shaft about 50 feet, and is getting some very rich ruby silver. An assay the other day run over 600 ounces, and while Mr. Panter is getting a little of this kind of ore, he is getting considerable concentrating ore. The leasers on the Gem are working away with some encouragement. They are drifting from the shaft in a northeast direction, and are hopeful of getting mineral very soon. This claim is on the north end of the Forest Queen. The Forest Queen is working a force of 15 and 20 men, and are driving ahead on the lower tunnel, having passed the shaft some 150 feet.

MONTANA.

AROUND DEER LODGE.—*New Northwest*, Dec. 21: The owners of the Empire State lode—Conrad Kohrs, Peter Lansing and C. P. H. Bielenberg—contemplate developing it in the spring. They have brought down some good ore lately and the lead is a strong one. Nothing definite is yet known in relation to St. Louis parties working the Mountain Lion. Mr. Gable writes the outlook was very encouraging. We mentioned some time since the shipment of a carload of ore by W. P. Emery, from the galena and silver camp eight miles east of town. We have not learned the returns therefrom, but a few days ago Messrs. John Devlin and Joseph Peterson shipped ten tons of first-class and two tons of second-class ore from the same camp. It was sold to the Butte Sampling Works, the first-class netting \$71.27, and the second class \$16 per ton, the purchaser paying railroad freight. It cost \$5 per ton to extract the ore and \$3.50 per ton to haul it to the Deer Lodge depot, leaving the owners \$642.70 above all costs and expenses. This is pretty good for what was practically float rock. Work is

progressing very favorably on the Champion shaft on the Lily, averaging 11 feet per week, which will carry it 100 feet by Feb. 15th. Work has now commenced on the east level at the 250-foot station, and it will soon be shown up what lies in that direction. Ore is also being taken out on the west 250-foot level. It is really one of the finest developments ever made in Montana; and if a body of ore is struck at 350 feet like that at 250 feet, it will surpass any mine ever opened in the Territory.

BELT MOUNTAIN.—*Great Falls Tribune*, Dec. 14: Prof. Mortson has returned from Wolf creek. He reports the mines in full activity. New strikes are being made almost daily, both on Dry and Running Wolf. On Dry Wolf preparations are being made for sluicing on the placer claims during the spring. A force of men is working on the Higby and Pierce claims to great advantage. Several new claims have been located. At the head of Running Wolf, Swingley, Sutton & Co. are pushing work vigorously. About half a mile below their claims Briggs & Co. will develop their property through the winter. The Morston Woodhurst shows a larger body of ore than ever. Still lower down the gulch, Woodhurst, Owens, Kendall, and Mix have made new locations. A road has been completed along nearly the whole length of the gulch. Heavy shipments of ore are coming from there to the smelter, and will be here in a few days. A great many teamsters are loading ore at the mines at present. Prof. Mortson says that the predictions made last summer by Messrs. Eilers and Enrich in regard to the finding of carbonate deposits at the porphyry contacts in the Belt mountains are now being realized. This is a matter of considerable importance as regards the future mineral supply. These carbonates can be mined and reduced more readily than other ores in this region. The miners are all hopeful and confident that the Belt mountain camps will be lively during the coming spring.

DAKOTA.

RUBY BELL.—*Deadwood Pioneer*, Dec. 20: The Ruby Bell Co. has a force at work extracting ore from the face of the tunnel. The ore is high grade, a good deal of it showing a quantity of free gold. Surveys of underground workings and developments of the Buxton Co. will be made by Engineer White during the present week. Actual surveys show the Golden Reward Co. has a breast of ore in sight 150 feet long and 8 feet high. Actual samples prove the average value of the ore to be \$30 per ton. It is stated that there are at present a greater number of men employed in the mines of Bald mountain and Ruby basin than ever before. There is not one vacant cabin in either of the camps, and every boarding-house is crowded to its utmost capacity. At Carr's place men are sleeping in stables for want of more comfortable lodging. The Big Chief Co. has commenced active operations on their property, which will be continued all winter. This company has done a large amount of work already, and intend to continue until they can produce paying ore, of which they have a large body.

UTAH.

TINTIC DISTRICT.—*Cor. Salt Lake Tribune*, Dec. 17: Tintic district is doing better in the line of shipping ore than ever before. The first half of the year was comparatively quiet, but the bulk of ore shipments the past six months have been constantly piling up, so that now the Salt Lake & Western is bringing out about 20 carloads per day. Among these shipments the past three months was about 2000 tons of pulp or tailings from the old Mammoth works at Tintic. These tailings were shipped to Denver, but now they are being worked by a leaching process. The iron mines are sending fluxing ore to Montana at the rate of two or three carloads per day. In looking into the ore shipments from this district, it is not pleasing to learn that the great bulk is going outside of Utah for reduction. The policy which makes it to the interest of ore-producers to sell outside is not favorable to building up the industries in this Territory. The fault seems to be chiefly chargeable to the railways in offering better rates for carrying away our ore than for encouraging our home smelters. The Bullion, Beck & California Co. is driving ahead, opening new levels and developing large bodies of ore ready for stopping, and at the same time is sending out ore regularly. This property appears to constantly grow in extent as the crosscuts and drifts are pushed ahead, while it holds out fully in going down. The Eureka Hill property is shipping more than ever before, and of course employs a larger force of men. The Centennial-Eureka made a small shipment in May, and began regular work in August. The record made since that date is certainly good. The Gemini company is putting up fine hoisting works on their Keystone property and will have them in full operation by the last of this month. This will give four large shippers from Eureka, all being located on that great mineral lode and in direct line with each other. Mammoth Hollow is doing well and shipments are regular. The Mammoth is developing finely, there being ore in all the levels and crosscuts. The iron mines are shipping more than ever before, part of which goes to Montana.

AT THE HORN SILVER.—Around the Horn Silver at Frisco there is an appearance of a perpetual Sunday. A visitor this week found an engineer at the small shaft, an official was in the assay office, and a lone man was in the blacksmith shop watching the dying embers of the forge. The doors of the big hoisting works were all closed, and the only sign of life about it was smoke coming from the boiler stack and the small noise of escaping steam. The only information that could be elicited was that 20 men were working down the small shaft, and as many more in the big one; the former being 400 feet deep, including an incline, and the latter 1300 feet, and that winzes had been sunk still deeper from the lowest level. Everybody about Frisco either knew nothing about the workings in the mine or else their lips were sealed. Some ventured the expression of a hope that with the New Year there would come a change of management and better days for the mine and camp.

NEW MEXICO.

DEVELOPMENT WORK.—*Silver City Enterprise*, Dec. 20: Two bars of bullion, the production of the recent mill-run at Telegraph, were brought in Friday

evening last. The bullion is .998 fine, and is valued at \$1700. The parties who purchased O'Connor & Duncan's interest in the Telegraph mines are expected to arrive here shortly. They will resume operations at the mines. Work will be commenced on the Rose mine at Bullard's Peak about January 1st. The Rose has generally paid her way and has produced a great deal of ore worth from \$5 to \$10 per pound. General Manager W. C. Hadley of the Silver Mill Co. of Lake Valley has five machinists employed in repairing the old mill at Lake Valley and putting in place the new machinery. James Dodd and Mat Miller returned from El Paso with the returns of a shipment of ore from the Alhambra. They were well satisfied with the returns and also the treatment they received. The Deep Down mill starts up on Monday next. The contractors are ahead sufficiently to keep the mill going steadily. The contractors state that they can take out the 5000 tons of ore, for which they are under contract, above the first level. Sinking and development is being continued. Judge Sloan of Santa Fe, who was in the city last week, is interested in a new electric process for treating ore, the expense of which will not exceed \$1 per ton. He is confident that \$5 ore can be milled and worked by his process at a profit. Thos. B. Peby returned from New York last week and informs the *Enterprise* that his company has reorganized and is now known as the Minibres Consolidated Mining Company, Mr. Peby, of course, surrendering his lease on the property. He is interested in the company and will run the property as the company's agent. The mill is being thoroughly overhauled and repaired at an expense of about \$10,000.

COOK'S PEAK.—*Silver City Enterprise*, Dec. 21: James Martin has been spending a few days in this city. He hails from Cook's Peak, where he is in charge of the Graphic works. While there has been very little said of this camp, it is certainly one of the most promising in the Southwest. There are about 40 men at work there, the majority of whom are working on their own property. The mines of the camp have been good producers from the surface, all of the owners having more than made wages while developing their properties. The ore runs very high in galena, and the most of it averages about 100 ounces in silver. It is a desirable ore for smelting. Mr. Martin informs the *Enterprise* that work on the Graphic has progressed steadily and that the mine is now in fine shape and looking better than at any time in its history. The main shaft has now reached a depth of 165 feet, and will be continued to 220 before crosscutting again. Several drifts have been run. During the past year Cook's Peak has probably shipped more cars of ore than any other camp in the county outside of those mining iron and copper. It might also be said that the camp, during the past year, has also made a more steady and healthy progress than any other new camp in the country. There are a large number of mines from which ore has been shipped with more or less regularity than any camp—except Pinos Altos, Kingston and Hermosa—and yet it is comparatively a new district, and the mines have been opened up by the original locators, without the aid of outside capital. It is sure to be one of the best camps in the Territory within two years.

OREGON.

THE TOM PAINE.—*Bedrock Democrat*, Dec. 19: J. W. Young returned Sunday evening from Portland, where he perfected every arrangement for operating the Tom Paine mine at Pocahontas on an extensive scale. The fact that Mr. Geo. B. Markle, vice-president of the Oregon National bank, and one of the wealthiest men in Oregon, has become one of the principal owners of the property is a sufficient guarantee that the Tom Paine will take front rank as a dividend-paying property. We are informed that a steam-stamp mill has been purchased at the foundry of Smith Bros. & Watson, in Portland, and has been shipped and will arrive here at once and be erected on the mine.

FROM SPARTA.—Wm. Ainsworth gives us a few items of interest from that camp. The Del Monte group of mines continue to be developed under the supervision of Jay Guy Lewis, and are making a fine showing. This property is now in the hands of Eastern capitalists, and a sale is pending. It is expected that these mines will be operated extensively in the spring. Arrangements are being made for the erection of a mill on the Little Pittsburg property, and Messrs. McCoy, Brophy and others who own the mine are in Sparta at the present time making the necessary preparations. It is said these parties have laid out a new townsite at the head of Lone Pine gulch, south of Sparta. The quartz and placer mines in the vicinity will afford the means of support for a number of people and build up a good camp. The new town would be nearer to Baker City by several miles than Sparta, and we presume this is the main object in the new townsite.

BAKER COUNTY MINES.—*Bedrock Democrat*, Dec. 12: The New York company, represented by Mr. John Williams of this city, and owners of the North Pole mine at Cracker creek and the Big Aleck mine in McCord's gulch, five miles west of this city, is making preparations for extensive work on both these properties. The mill machinery for the Eureka and Excelsior mines at Cracker creek is now being transported by team from this city to the mines, to be on the ground ready for its erection early in the spring. At the Columbia mine at Cracker creek there are about 25 men on the payroll and the mine is showing up splendidly. The Gray Eagle will be developed to the extent of several hundred feet in the spring, as work will continue on it all winter. The La Bellevue is turning out thousands of pounds of concentrates for shipment to Denver. The mines of Isaac Kloop, in the near vicinity of La Bellevue, are being developed, and work on them will be continued all winter. We understand that Geo. B. Markle, vice-president of the Oregon National Bank of Portland, is one of the purchasers of the Tom Paine mine in Pocahontas district, and that this property will be put under a rigid process of development at once and a mill erected yet this winter. The Little Pittsburg at Sparta is being developed, and the chances are very favorable for a mill to be erected on the mine at an early day. Taken altogether, the mines of Sparta look well. The Sanger is turning out its thousands of dollars monthly in bullion, and new ore chutes are being found daily. The Sanger is a great mine and will continue to be for years to come.

MECHANICAL PROGRESS.

Rope Transmission.

For transmission of power over long distances from 100 to 1000 feet or more, ropes are coming more into use than formerly. They have been used at widely different places for many years, but it is only quite recently that their value has been more fully recognized as an economical, convenient and efficient means for accomplishing the end for which they have thus been brought into use.

The system was first introduced into English shops and manufactories, where its advocates have long claimed for it less cost than leather belts and better adhesion. Moreover, when in exposed locations, water will not damage ropes, and they are not subject to such sudden giving out as leather belts. Any little beginning of weakness may be more readily observed and provided against. Another important advantage is that power can be readily added to shafting by putting on additional ropes. In case of a rope breaking, only the shafting and machinery driven by that rope alone has to stop; whereas, if a large belt transmitter was used, the entire mill or factory has to stop until the break is repaired.

As prime transmitters between the central power and the general system of shafting, they are generally considered to hold a decided advantage over either gearing or leather belts.

One instance is noted where 700 horse-power is transmitted by 20 ropes being run in V-shaped channels on a single drum 12 feet in diameter conveying power to wheels seven feet in diameter—two-inch diameter ropes being used.

English manufacturers have never made such a general use of belts for transmitters as has been done in this country. The life of a rope is much shorter than that of a belt—about seven or eight years, while a good leather belt properly made up and of proper size for the duty required of it, will sometimes last for a lifetime. The difference in wear is about compensated for by the less cost of the rope.

English manufacturers have never been partial to belts, and were for many years quite incredulous as to the possibility of conveying high power by belting, as is done in this country. Gearing is much more generally used there than here. American belt manufacturers have furnished many factories in England and on the continent with heavy driving belts.

The results which have been obtained with ropes have not always been of uniform excellence, mainly, however, because designers have in some cases failed to recognize properly the requirements of good working. Where rope-driving has been tried and has failed, examination has almost invariably revealed a disregard of correct principles of construction, and has shown nothing calculated to detract from the favor in which the system is held, especially where a continuous high speed is required. In mill districts, particularly, engineers have not been slow to avail themselves of these advantages, and with the cotton rope most satisfactory performances are recorded. The field of usefulness of rope-gearing is gradually being extended.

Wire-Rope Transmission.

With wire-rope transmissions for outdoor use, and long spans, serious trouble has been found to arise from excessive vibrations of the rope. Careful management, however, has had the effect of almost entirely eliminating these disturbing influences, and instances are now not rare where very long spans are used with perfect satisfaction.

In this country there are a number of instances where distances from 300 to 1000 feet or more are used, notably at Sihley College, Ithaca, N. Y., where the span is fully 1100 feet. In Europe wire ropes are found practicable and advantageous for much greater distances, ranging all the way from 50 feet up to several miles. As an example of long transmission, that furnished in Schaffhausen, Switzerland, at the falls of the Rhine, is quite notable. There some 800-horse power is carried diagonally across the live and extended a distance of two miles, being there distributed among the 50 different manufacturing establishments, situated in every imaginable position and embracing all the varied arrangements of changing directions. This use of wire ropes has been increasingly produced in Europe, the transmission coming into use at the point where a belt or shafting becomes of too great length to be employed profitably.

Prof. Osborne Reynolds says that steel ropes as transmitters of power have a great advantage over shafts, because the stress on the surface will be uniform, the velocity will be uniform, and may be at least 10 to 15 times as great as with shafts, say 100 feet per second; the rope is carried on pulleys, which may be at distances of 500 or 600 feet, so that the coefficient of friction will not be more than 0.015 instead of 0.04.

A recent correspondent of the *American Machinist*, who has had a very large experience in rope-driving, prefers pulleys about $\frac{3}{4}$ feet in diameter, with end of wood to the rope. After using many shapes of grooves, he gives preference to 55° pitch. A small clip of the rope causes much greater wear than loss from supposed wedging in a sharp groove. He soaks his ropes in warm tar.

THE STEEL SLEEPER BUSINESS.—A very great activity seems just now to mark the steel-sleeper business in England, and the competition for the orders offering is keen. Some of the Staffordshire steel-masters were recently in receipt of inquiries for 15,000 tons of sleepers for narrow gauge for export. But Staffordshire does not particularly lay herself out for the sleeper trade, and the inquiries have been passed on elsewhere. A contract for Bungal and Nagpur has recently been given out at from \$23.75 to \$24.15. In this country attempts have been made to a considerable extent to substitute metal for wooden ties on railroads, but it does not yet appear that the right kind of tie has been invented. Wood is cheaper here than in England and possesses the quality of yielding in just about the right degree, and a metal tie should come as near to the same degree of yielding as possible. The way the railroads are using up the stock of available timber should be an incentive to some ingenious inventor to bring out a metal tie equal to a wooden one. An iron tie experiment is to be made by the New York Central, which has placed a contract for 800 ties. They will be laid on the new Harlem tracks.

WHAT AN AMERICAN MANUFACTURER IS DOING IN CHINA.—According to the *Lowell Times*, Albert Whitney Danforth of that city is largely interested in a manufacturing enterprise in China. Recently the Lowell machine shop and Providence machine works have been shipping machinery, and Brown Bros. & Co. of Providence mill supplies to the Shanghai Cotton-Mill Company, whose buildings will be all ready to commence operations at once on its arrival. Power will be furnished by a 500-horse power engine, in the construction of which Mr. Corliss took great interest and gave it much personal attention. The company has a monopoly and is under imperial protection. Its works are on the Wangpoo river, near its junction with the Woosung, and about three miles from the "foreign settlements" of Shanghai. The Franco-Chinese war and some other events seriously embarrassed the Shanghai Cotton Cloth Company, and it has taken some time to recover. The company retained Mr. Danforth to care for its property and interests. He is in excellent health and a "heavy weight" physically.

HEATING ROLLING-MILL ROLLS.—London *Engineering* illustrates and describes in a recent issue a device for heating roller-mill rolls by gas. The gas is burned in jets, which are uniformly distributed the whole length of the rolls at each side. When these jets are lighted and the machine is put into slow rotation, every part of each roll is gradually and uniformly heated without the production of any dangerous strains. This method of heating rolls is said to be in use by Messrs. Bolckow, Vaughan & Co., the Downais Iron Company and the steel company of Scotland. In one mill the average life of the rolls previous to the application of the gas was 793 days, and after the application 342 days. The device is the invention of Franklin Hilton of Middlesboro'-on-Tees.

A NEW BUILDING CEMENT.—London *Industries* says that the cement by which many stone buildings in Paris have been renovated is likely to prove useful in repairing the foundations for machinery. The powder which forms the basis of the cement is composed of two parts oxide of zinc, two of crushed hard limestone, and one of pulverized grit, together with a certain proportion of ochre as a coloring agent. The liquid with which this powder is to be mixed consists of a saturated solution of six parts of zinc in commercial muriatic acid, to which is added one part of sal-ammoniac; this solution is diluted with two-thirds of its volume of water. A mixture of one pound of the powder to $\frac{2}{3}$ pint of the liquid forms a cement which hardens quickly and is of great strength.

SPONTANEOUS COMBUSTION.—A recent case is reported where a painter engaged in a mill removed his overalls at 6 P. M. to go home. At 8:30 the watchmen, discovering smoke in the mill, summoned the engineer, and together they searched the premises carefully, tracing the smoke to a small room in which the overalls were discovered, and in one pocket was a bunch of greasy waste which had ignited. This goes to prove that spontaneous combustion will ensue in less than three hours if the conditions are all right.

A NEW WOODEN PULLEY has been devised on an entirely new principle. The center is of cast iron, and the rim is of wood, and it is made in two parts. It is claimed that by its use better belt friction is obtained; and a saving in power is realized, as the spokes are so formed as to offer little resistance to the motion. By a novel and effective paper hushing, keys and set screws are entirely done away with, and the grip upon the shafting is perfect.

OUR STEEL RAIL INDUSTRY.—No steel rails were made in this country 20 years ago, and the imported rail cost \$120 per ton. Now we produce 1,764,000 tons, and rails sell at \$30 per ton.

STEEL AS CHEAP AS IRON.—A Pittsburg firm has offered soft steel for structural use at the same price as iron.

COAL loses from 10 to 40 per cent of its evaporative power if exposed to the effects of sunshine and rain.

SCIENTIFIC PROGRESS.

Terrible Electric Storm at Sea.

Electricity sometimes gives us terrible displays of its presence, and energy and phenomena often occur which puzzle the scientist to explain. A report of such a display at sea occurred on the 31st of October last in latitude 41° 42', longitude 54° 42'. We condense the description as given by the captain. The occurrence took place on the ship *Swedish Edward*, on her passage from Havre to New York:

Just before dawn the entire crew was at work bracing the mainyard. The ship was scudding along close reefed before a strong gale when the phenomena occurred.

It blew great guns and we were compelled to scud before it under bare poles. The seas were heavy and knocked my little ship about as though it had been a jollyboat. The gale had continued for several days, when, on the morning of the 31st, the sky grew darker as morning advanced, and the lightning and thunder drew nearer. About half past three A. M. it was directly over our ship. I had just ordered the men to brace the mainyard, when their work was suddenly interrupted by a loud crash of thunder, followed by an explosion like that of a thousand cannon. The lightning struck the main rigging directly over the men, and at the same moment a ball of fire just like a shell hopped about the rigging and then exploded. It was something sublime, although terrifying.

When the ball of fire exploded, streaks of lurid flame darted in every direction. It was just like the falling of a multitude of stars. For miles around the sea was illuminated, and every cord in our rigging shone like a strand of silver. The brilliancy was but momentary, however, and we were left in darkness to contemplate our thrilling position.

In less than five minutes another terrible flash of lightning, followed by another explosion and another ball of fire, augmented our terror, and sent me scurrying in every direction for shelter. We were all thoroughly frightened. The crew could not do any work. But our fears and astonishment were destined to be still further increased. Just as we were getting on our feet again, and thanking God that we had escaped with our lives, there was another thrilling display.

Suddenly and with a terrible sound a flash of lightning broke right above the main rigging, and out of it we could see another ball of fire playing above the rigging from the starboard side right over to the port. It, too, exploded, but with a noise and scattering of flaming fragments which sent the previous ones into comparative insignificance. I was dazed, and when I recovered eight and sense, not one of my men were on their feet. Some were tumbling about on the top of each other, some crying with fear and others stretched on their backs as though they had been struck dead.

One by one they got over the shock and fright. The second mate could not speak for several hours, and the whole work of keeping the vessel before the wind devolved on me and the first officer, who fortunately were not right under where the balls of fire exploded. The shock to the ship was terrific, and the timbers cracked each time we were struck.

As soon as the crew were able to get around I made a thorough examination of the vessel and rigging. It was not injured in the least and showed no signs whatever of the awful fuelade. The crew were all right in a day or so, but the second officer, who was among those stunned, complained for several days of a severe pain in the stomach, but now he is as hale and hearty as ever.

I have been in many storms during my long career on the sea, but never before had such an experience. We frequently meet these electrical displays, but I have never heard of one of the intensity of this. My vessel was loaded with iron ore, and this may have acted as a magnet to attract the meteor, or whatever you may call them.

[Bolt lightning, as it is called, is a rare manifestation of electrical phenomena. Until recently there were but a few authentic instances of its occurrence, and no very satisfactory explanation has ever been made of this very curious electrical display. Bolt lightning generally follows a stroke of ordinary forked lightning. It seems to come directly out of it in the form of a ball or bomb and makes its way, independent of any conductor, to the earth, often rebounding several times, as an ordinary ball would before coming to rest. The ball usually disappears with an explosion, as in the case above narrated, although it sometimes disappears quietly as though it were a glow of phosphorescent light. When such a phenomenon appears the lightning stroke seems to have been, from some cause, suddenly arrested in its course and its final energy exerted in the slower and more noticeable manner of ball lightning.]

Some interesting observations in regard to lightning have recently been made by Prof. Colladon of Geneva. His observations go to show that when lightning strikes a tree, for instance, it is first attracted by the numerous tiny top branches and by them conveyed to the limbs and from thence to the main body, where by concentration and greater resistance it makes its course manifest by hurrying the bark or the tree itself. It is possible that such obstructions may sometimes convert the swift-moving forked lightning into the

slower form of ball lightning. In the case of the ship as above, the tall topmast, the yards, ropes etc., were the prime conductors which led to the change to ball lightning, before the "fluid" reached the deck.—EDS. PRESS.]

A NEVER FAILING SUBSTITUTE FOR STEAM WHEN COAL GIVES OUT.—Discussing this subject, *Modern Light and Heat* closes as follows: A moment's reflection as to why we use coal as a source of energy will tell us what we can substitute for it when it is all gone. Roughly speaking, either a lump of hard coal weighing two and a half pounds, or 453 gallons of water which can be made to fall ten feet, will produce commercially a horse-power hour of work. The obvious reason why we prefer the lump of coal to the tank of water is this, that we find it already made for us; it will keep indefinitely and will not leak out through cracks; and lastly, we can bring it cheaply to the spot where we want the work done, and there burn it in a suitable boiler and obtain the horse-power hour of work. We hear people say that coal contains merely the stored energy of the sun. To be sure, but so also the water which is raised to a height above the sea in the form of rain, contains the stored energy of the sun, and if it is allowed to simply run down to the sea in rivers, the energy is made to do no useful work. It is a consoling fact that at the present time there is more energy going to waste in the form of fresh water lifted by the sun's rays and in the form of salt water lifted in tides by the moon's influence than is developed by the entire yearly consumption of coal, and it is a still more consoling fact that this source of energy is no further beyond our grasp than was the energy of coal a hundred years ago. It has already been demonstrated that through the agency of electricity we can at any chosen place use the energy of the winds and tides and running waters in a way that is almost equivalent to burning coal without digging it from its native bed.

THE TRAMP ACROSS GREENLAND by Dr. Nansen and his accompanying party of scientists, to which allusion has already been made in these columns, did not result in any discovery of scientific import. The party had expected to have made a landing high up on the eastern shore, but were unable to do so, and the vessel in which they took passage was forced to land them at a point so near the southern shore that they saw but little of "Greenland's Ice Mountains" beyond what any navigator might see by a voyage around its southern extremity. Still the sufferings of the party were so intense that in all probability no other party will ever undertake to cross that continent at any more northerly point. They traveled about 350 miles, but were not at any time over 100 miles from the ocean, yet they crossed a mountain range at an elevation of 9000 feet above the sea, with icy peaks at least 100 feet higher in sight. They endured great hardships and braved many mountain perils. He who explores Greenland to any purpose must land several hundred miles above the point where Dr. Nansen disembarked, and make his way through the heart of that Arctic continent. But what aid to either science or commerce would he gained by such a foolhardy trip across such an ice-covered region is more than the ordinary mind can imagine. There might be some gain to science if a nearer approach could be made to the North Pole in settling the question of a supposed open polar sea, for the existence of which there are very many indications, and for a determination in the aid of commerce and navigation of the mystery of circumpolar ocean currents.

A NEW OIL LIGHT.—A new oil light was shown in public near London recently. It is stated that the principal feature of this new light is the mode of evaporizing the oil and preventing its escape in the form of spray, or, in short, the method of obtaining complete combustion. Creosote oil is ordinarily used, and, after a small quantity of spirit has been poured on the surface of the oil contained in the well of the lamp, a light is applied and the radiating covers put on. Compressed air is then turned on, which, passing by means of a small jet through the center of the flame and over the surface of the oil in the well, forms a high temperature and also produces an induced current, which raises the gas of the heated oil and at the same time draws in the necessary supply of air to complete perfect combustion and produce a powerful light. The well of the lamp is connected with a tank or reservoir, insuring a constant supply of oil. The flame forced up from the lamp emits no smoke, and the light, though naked, does not dazzle the eyes. The light is chiefly intended for industrial work on a large scale, such as in connection with railways, docks and buildings, where the illumination of large spaces in the open air or under cover is required. Either common creosote oil, crude petroleum, or any other heavy hydrocarbons may be used.

A NATURAL WELL OF REFINED OIL.—It is stated that on the Summerville farm, three miles north of Brady's Bend, Penn., an oil-well is located which every day pumps about a barrel of first-class refined petroleum. The residents of that vicinity purchase this illuminant and burn it in their lamps without its having gone through any process. It answers the purpose equally as well as the finest illuminating kerosene, does not smoke nor has it an unpleasant odor.

USEFUL INFORMATION.

LOOSE TIRES AND SPOKES.—A correspondent of the Germantown, Pa., *Telegraph* writes to that paper as follows: "In a recent issue of the *Telegraph* there is an item in regard to oiling wheels with hot linseed oil when tire and spokes are loose, instead of having the tires reset. I have practiced this method for the last nine years, and have found that the wheels keep in much better condition than when I went to the blacksmith and had the tire reset. I have a one-horse farm and lumber wagon, and the tires had become so loose that it was difficult to keep them on the fellows, but not knowing the use of oil I had them reset. Two years after I saw the statement made in regard to oiling them and tried it, and from that time to the present the tires are as tight as a nut, and the fellows as hard and sound as a nut. By repeating the oiling once in two years they will remain so until they are entirely worn off. For resetting it cost me \$2, for the oil it cost me about 15 cents. A better illustration of the advantage of oiling wheels instead of resetting tire was in the case of my wheelbarrow, the wheel of which had become so dry and shrunken that the tire would fall from the fellow; but by giving it three good oilings the tire has become so tight and firm, and has been so for the last five years, that it could not be driven off with a hammer. I have recommended this course to a number of my neighbors, and they have found by practical experience that oiling the fellows, spokes and hubs of their wheels is preferable to taking them to the blacksmith-shop to have the tire reset, while the expense is a mere trifle. Try it and see if it is not so."

BURSTING OF THE HAINSWORTH CAST-STEEL GUN.—It seems that the steel gun about which so much has been published during the past year has served only to illustrate the pluck and energy of a Pittsburg firm that persisted in an experiment which from the start was said to have had small chances of success. This gun, under the direction of Supt. Hainsworth, was recently tested at Annapolis. Quite a number of naval officers and a party of visitors from Pittsburg were present, when a preliminary charge of 36 pounds of powder and a projectile weighing 10 pounds were put in the gun. This was fired without the least effect upon the piece. The charge of powder was then increased to 50 pounds, but when the smoke of the second shot had cleared away, pieces of the gun were found in various directions, while the structure that had been raised around it, and the building covering all, were almost totally wrecked. It cannot yet be determined whether the test was positive proof that cast-steel guns must be a failure, and that only steel guns constructed on the built-up process can be made a success, although it is admitted that no flaw could be found in the fragments. The gun was an experiment, and if it can be made successful will greatly reduce the heavy cost now entailed in the construction of steel guns of large caliber. No announcement has yet been made whether or not the experiment will be repeated.

HOW TO MAKE GROUND GLASS.—A correspondent of the *Scientific American* gives the following process by which he has made ground glass: "I first bought five cents' worth of emery and two plates of glass the size required. Spoiled negatives will do if they are cleaned, which can be done with a strong solution of lye. I placed one of the glasses on a flat board and sprinkled a small quantity of emery on it, which I wet with water. Placing the other glass on that, I ground them together, renewing the emery and water whenever necessary. In about one hour I had two of the finest quality of ground glass, fully as good as those I would have to pay 75 cents for (8x10 inches)."

PUMP DISCHARGES.—When the suction pipe of a pump is long or has bends in it, or if the water has to pass through valves on its way to the pump, its diameter should be larger than the water-chamber inlet, and be contracted at its connection to the diameter of that inlet. The diameter of suction pipe, in each case, for an inch inlet should be $1\frac{1}{2}$ inches; that for a two-inch inlet $2\frac{1}{2}$ inches, and that for a three-inch inlet should be $3\frac{1}{2}$ inches, and so on, in about like proportion, diminishing the ratio somewhat as the size of the inlet increases.—*Safety Valve.*

FRESNO is to have a 'possum farm. Jesse Irwin, a prominent citizen of that place, has just returned from Pike county, Mo., with a carload of these animals. The ranch is to be fenced with an old-fashioned rail fence, covered with guard wire, and each recess of the fence is to be supplied with a hollow log. He is going to plant 20 acres of persimmons and the same number of acres of black haws, and his sweet-potato patch will be the largest in Fresno county.

The zinc mines of the Pern Zinc Company, located at Galena, which were the most extensive in the United States, and which have been closed for nearly three years, will be reopened soon and a large force of men put to work.

A **USEFUL INVENTION** is just now being introduced into this country from Germany, whence we derive no inconsiderable number of novelties. It consists of a metal

joint to be used at each corner of an ordinary card-board box for the purpose of securing the adjacent sides in a stronger and better manner than by the employment of paper and paste. The sides of the box are also turned inward instead of outward, after the groove or joint is made, and this also tends to strengthen the joint. It is claimed that a much stronger and more durable box at a slight reduction in cost is the result of this process, as compared with those made in the usual way.

RAILWAY ROLLING STOCK FOR SOUTH AMERICA.—Heavy Argentine contracts are reported as having recently been made by Senor Miguel M. Tadin of Buenos Ayres for locomotives, passenger and other cars intended for the Government railways of the Argentine Republic. A contract for 50 locomotives is mentioned, but is not yet exactly located as far as the lucky builders are concerned.

A SELF-REGISTERING CONTRIBUTION-BOX.—An Englishman has invented a contribution-box that registers the amount deposited. Nothing less than five cents goes, and a charming chime of bells are agitated with emotion when a dollar drops into the slot.

WHAT IS A "MASCOT"?—The term is a French provincialism meaning one's lucky wight or charm for good fortune. The term in French is "la mascotte," and is of the feminine gender. "Le mascot" is the masculine form, but the feminine is always used.

TO HARDEN PLASTER OF PARIS.—To harden plaster of paris, add five or ten per cent of hydraulic cement to the plaster before wetting. Five per cent of finely ground sulphate of potassium will give even a quieter degree of hardness.

AMERICAN LARD.—In addition to the enormous quantity of American lard which enters into home consumption, more than \$40,000,000 worth is exported every year. Lard ranks sixth in value out of \$800,000,000 of American exports.

THE LARGEST ELECTRIC PLANT in the world will soon be put in operation. London is to be illuminated by electricity, and a contract for the immense undertaking has already been made.

OSTRICH FEATHERS.—It is said that the demand for ostrich feathers has recently largely fallen off. This will not be good news for our California ostrich farmers.

GOOD HEALTH.

The Dread of Death.

Sir Lyon Playfair has written to Junius Henri Brown the following letter in regard to the latter's paper in the *Forum* on the "Dread of Death":

Dear Sir:—I have read your article on death with much interest. This subject has often occupied my mind, and I have been led to the same conclusions. Having represented a large medical constituency (the University of Edinburgh) for seventeen years as a member of Parliament, I naturally came in contact with the most eminent medical men of England. I have put the question to most of them, "Did you, in your extensive practice, ever know a patient who was afraid to die?" With two exceptions they answered "No." One of these exceptions was Sir Benjamin Brodie, who said he had seen one case, that of a young girl of bad character who had a sudden accident.

I have known three friends who were partially devoured by wild beasts under apparently hopeless circumstances of escape. The first was Livingstone, the great African traveler, who was knocked on his back by a lion, which began to munch his arm. He assured me that he felt no fear or pain, and that his only feeling was one of intense curiosity as to which part of his body the lion would take next. The next was Rastem Pasha, now Turkish Ambassador in London. A bear attacked him, and tore off part of his hand and part of his arm and shoulder. He also assured me that he had neither a sense of pain nor of fear, but that he felt excessively angry because the bear grunted with so much satisfaction in munching him. The third case is that of Sir Edward Bradford, an Indian officer now occupying a high position in the Indian office. He was seized in a solitary place by a tiger, which held him firmly behind his shoulders with one paw, and then deliberately devoured the whole of his arm, beginning at the end and ending at the shoulder. He was positive that he had no sensation of fear and thinks that he felt a little pain when the fangs went through his hand, but is certain that he felt none during the munching of his arm.

I was led to the same conclusions as yourself when I attended the hospital as a medical student, and I thought you might like some confirmation of the views described in your interesting article in the *Forum*.

THE USE OF WATER ON THE SCALP.—"People become bald from washing the head," said an English barber. "The use of water on the scalp may make a man feel buoyant for a time, but you will notice that the hair becomes dry and brittle afterward. The water and subse-

quent rubbing with a towel dry up the oil in the roots, and in time the hair becomes dead and drops out. In England people never think of washing the hair. A good comb and stiff brush are all that are needed to keep the head clean. The women often spend hours in combing out their hair, and that is the most laborious part of a maid's work. Instead of shampooing, English barbers use a machine shaped like a little harrel and covered with stiff bristles. This is run by a small gas engine, and will winnow every speck of dirt out of a man's head in a few minutes. I have heard there are some in use in this city, but I have never seen one." Another important agent in causing baldness is the indiscriminate use of fancy toilet soaps. If you wash your head, use only good castile soap, and you will be surprised to find, if your hair has been falling out, how soon the loss will cease.

ACCIDENTS IN MILLS AND SHOPS.—A large number of accidents are constantly occurring in mills, machine-shops, etc., to employes, but mostly from carelessness on their part. Occasionally, perhaps, it is the fault of those in charge in not providing proper means to prevent these accidents. In most cases a lawsuit is the outcome from these accidents. The injured person naturally seeks to obtain damage for his sufferings, and in many cases, as is well known, with success, for juries, as a general thing, naturally sympathize with the injured party, and a verdict is accordingly recorded against the corporation. So often do cases of this kind occur that a company has been organized in Boston to insure employers against damages from this source. The cost of insurance is very small, as statistics show there is no more danger that an accident may occur to one of the employes upon which damages would have to be paid than that the building will take fire and burn down; therefore, a protection against these should be as desirable as one against fire.

MUSIC IN MEDICINE.—From the time when medical knowledge was first embodied in rules of practice, and probably from a much earlier period, music has held a recognized place in the treatment of disease. In no class of diseases, however, are we likely to derive so much benefit from the use of so pleasant a remedy as in those affecting the mind itself. In melancholia and allied states of depression its value is generally admitted in our own day. Ancient practitioners were also cognizant of its usefulness in this respect. We must all have felt how suitable is its infinite variety and facility of expression to the changing moods of the sane, and it is therefore the less difficult to understand how straying minds are pleased and settled by its charm. Certain it is that its beneficial effect is in this case considerable, and our readers, though possibly unable to acquire a knowledge of the art, should at least possess, and if needful assert in practice, a sense of its therapeutic value.—*London Lancet.*

SMOKERS' VERTIGO.—Dr. Dacaiene is reported in the *New York Medical Record* as having recently investigated a number of cases of vertigo in smokers. Out of 63 patients 49 were between 50 and 66 years of age. More than half of them suffered, in addition, from digestive troubles, with constipation, alternating with diarrhea, insomnia, palpitations, dyspnea and diuresis. In the third of the number there was marked intermittence of the pulse and granular pharyngitis, while others suffered from aphthae, amblyopia, etc. Thirty-seven were persons who smoked habitually on an empty stomach, and these suffered from vertigo, principally in the morning. The vertigo generally coincided with suppression of perspiration and diminished excretion of urine. The treatment consisted mainly in regulating or suppressing the cause, but 33 out of 37 patients ceased to suffer on merely refraining from smoking on an empty stomach.

TOUGH FRUIT SKINS.—The skin of plums is wonderfully strong compared with its thickness, and resists the action of water and many solvents in a remarkable manner. If not thoroughly masticated before taking into the stomach, this skin is rarely, if ever, dissolved by the gastric juice. In some cases pieces of it adhere to the coats of the stomach as wet paper clings to bodies, causing more or less disturbance or inconvenience. Rinses and dried currants are particularly troublesome in this way, and if not chopped up before cooking, should be thoroughly chewed before swallowing. If a dried currant passes into the stomach whole, it is never digested at all.—*Popular Science Monthly.*

A DISINFECTANT FOR THE SICKROOM.—A new disinfectant compound for purifying the atmosphere of the sickroom has just been presented to the Berlin Medical Society. Oils of rosemary, lavender and thyme, in the proportion of 10, 2, and $2\frac{1}{2}$ parts respectively, are mixed with nitric acid in the proportion of 30 to 1. The bottle should be shaken before using, and a sponge saturated with the compound left to diffuse by evaporation.

SMALLPOX IN MERCED.—Five cases of smallpox were reported in Merced December 15th. The dwellings where the cases exist are quarantined and marked by yellow flags. So far the disease is of a mild form, and the utmost care is taken to prevent its spread. Vaccination is general. The doctors are all busy vaccinating at the expense of the county.

California in London.

The meeting in this city on Tuesday of this week in the support of an enterprise proposed by Mr. Lubin of Sacramento for a permanent exposition of California products in London, was well attended and interesting. Among those present were the following:

Delegates-at-large—George C. Perkins, Adam Grant, P. B. Cornwall, Louis Sloss, H. M. Larue, Prof. E. W. Hilgard, T. H. Goodman, Albert Gallatin.
Alameda county—J. S. Emery, C. M. Plum, M. J. Keller.
Butte—E. T. Reynolds.
Colusa—Dr. A. Gray, J. B. de Jarnett.
Contra Costa—E. B. Smith, David Lush.
El Dorado—L. G. Harvey.
Fresno—A. B. Butler.
Kern—R. E. Houghton.
Los Angeles—W. H. Workman, H. Lindley, Dr. Burbank, J. B. Lankershim.
Lassen—C. G. Hutchinson, W. F. Perry.
Lake—Carrie Stevens Walters.
Marin—F. C. de Long.
Monterey—Jesse D. Carr, G. W. Nance.
Napa—M. M. Estee, Leonard Coates.
Placer—A. P. Hall, P. W. Butler.
Sacramento—Dr. G. L. Simms, E. L. Gregory, D. Lubin, W. R. Strong, G. W. Harcock.
San Benito—Dr. Thomas Flint.
San Diego—Alexander Gordon, Timothy Hopkins.
San Mateo—C. B. Turfill, I. M. Merrill, Frank A. Kimball.
San Bernardino—O. T. Dyer, D. L. Wilher, F. A. Miller, Matthew Gale.
San Joaquin—L. U. Shippeo, S. A. Woods, J. A. Merriam.
San Francisco—G. K. Fitch, W. H. Mills, Frank Dalton, A. T. Dewey, General Harby, John P. Irish, Santa Clara—T. Beach, W. C. Andrews, N. Cadwalader.
Sonoma—H. W. Byington, John Adams.
Solano—G. P. Plaister, G. N. Platt.
Stanislaus—J. B. Caldwell, E. B. Beard.
Tehama—N. P. Chipman, J. S. Cone.
Trinity—T. J. Timlin.
Ventura—Geo. A. Newhall.
Yuba and Sutter—J. B. Montague, John Hall.
Yolo—R. B. Blowers, Wm. Suddon, C. W. Reed.

The meeting was organized by the advice of A. T. Hatch as temporary chairman, with J. Meredith Davies and C. B. Turfill temporary secretaries.

The following committees were then appointed by Chairman Hatch: Permanent Organization—Mr. Workman, C. B. Turfill, P. B. Cornwall, H. M. Low, and H. W. Byington; Order of Business—W. H. Mills, Mr. Wilbur, Harvey Lindley, M. M. Estee and Jesse D. Carr.

The committees retired, and in their absence David Lubin and Mr. Taber of Sacramento addressed the meeting in support of the general proposition of a California exhibit in London.

Mr. Estes then presented a resolution that a permanent exhibit of Californian products be established in London. The resolution was unanimously adopted.

The Committee on Order of Business presented the following report, which was adopted:

First—Consideration of general subject, and answer to the question, Shall an exhibition of the products of California be held in London?
Second—The duration of such exhibition.
Third—The general plan.
Fourth—Consideration and ascertainment of cost.
Fifth—Consideration of ways and means.
Sixth—Appointment of committees.

The Committee on Permanent Organization presented their report as follows: For Permanent Chairman, W. H. Mills of San Francisco; Permanent Secretary, J. M. Davies of Alameda; Vice-Presidents—A. B. Butler of Fresno, E. W. Jones of Los Angeles, and David Lubin of Sacramento; Treasurer, Louis Sloss. Also one vice-president for each county, and an Executive Committee of 15 members to be elected by the convention. The reports were adopted.

A. Daw-Kerrell, Surveyor Tinnin and Chas. B. Turfill of San Diego then addressed the meeting, after which the usual noon recess was taken.

At the afternoon session the first speaker was Prof. Hilgard of the State University. The professor approved of the project of the exhibition, and promised to do all in his power for its furtherance. N. Cadwalader and J. P. Irish also supported the proposition.

William L. Merry was also in favor of the proposed exhibition, saying that London was the center of the mercantile world.

Mr. Estee then presented the following:

WHEREAS, It is deemed desirable to make an exhibition illustrative of California in London; and whereas all portions of this State are equally interested in the success of such an exhibition; therefore be it

Resolved, That the Legislature be requested to appropriate the sum of \$-000, to be expended under direction of a commission appointed by the Governor maintaining an exhibition for two years in London.

Mayor Workman of Los Angeles moved that the blank in Mr. Estee's resolution be filled by the insertion of "\$250,000," and after some discussion the resolution as thus amended was unanimously adopted.

The following gentlemen were then elected members of the Executive Committee: P. B. Cornwall and William H. Mills of San Francisco; C. W. Playter of Alameda; J. B. de Jarnett of Colusa; T. E. Hughes of Fresno; Mayor Workman and J. B. Lankershim of Los Angeles; A. P. Hall of Placer, H. M. Larue and David Lubin of Sacramento; A. S. White of San Bernardino; Charles B. Turfill of San Diego; L. U. Shippeo of Stockton; N. Cadwalader of Santa Clara; H. W. Byington of Sonoma; N. P. Chipman of Tehama; and R. B. Bowers of Yolo. To this committee were afterward added A. T. Hatch of Solano, Captain Merry of San Francisco, Prof. Hilgard of Alameda and M. M. Estee of Napa.

The meeting then adjourned, subject to the call of the Executive Committee.

SAN FRANCISCO

Saturday Morning, Dec. 29, 1888.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Morgan's Ventilating Manhole; Machine for Making Spirally-Welded Tubing, 425.

EDITORIALS.—Spirally-Welded Tubing; Ventilating Manhole for Sewers, 425. Passing Events; Close of the Volume; Eclipse Observing Parties; Special Phenomena During the Eclipse, 432. A Mining Stock Association; Incline Railways, 433. Photographs of the Eclipse, 436.

CORRESPONDENCE.—Lixivation of Silver Ores with Hypoculphuric Solution; Neglected Sources of Power in the Mines, 426.

MISCELLANEOUS.—Mining Company Meeting, in London, 431.

MECHANICAL PROGRESS.—Rope Transmission; The Steel Sleeper Business; What an American Manufacturer is Doing in China; Heating Rolling Mill Rolls; A New Building Cement; Spontaneous Combustion; A New Wooden Pulley; Our Steel Rail Industry; Steel as Cheap as Iron, 430.

SCIENTIFIC PROGRESS.—Terrible Electric Storm at Sea; A Never Failing Substitute for Steam when Coal Gives Out; The Tramp Across Greenland; A New Oil Light; A Natural Well of Refined Oil, 430.

USEFUL INFORMATION.—Loose Tires and Spokes; Bursting of the Hainsworth Cast-Steel Gun; Pump Discharges; Railway Rolling Stock for South America; A Self-Registering Contribution Box; What is a "Masoot"; To Harden Plaster of Paris; American Lard; The Largest Electric Plant, 431.

GOOD HEALTH.—The Dread of Death; The Use of Water on the Scalp; Accidents in Mills and Shops; Music in Medicine; Smoker's Vertigo; Tough Fruit Skins; A Disinfectant for the Sickroom; Smallpox in Mexico, 431.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 428-29.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 440.

Passing Events.

The last week of the year brings also the end of Volume LVI of the MINING AND SCIENTIFIC PRESS. This is also the best time for the renewal of subscriptions. We hope this gentle hint will be responded to promptly by those who have thus far neglected to send in their orders.

Under the U. S. mining laws, this is the last week for miners to do assessment work on their claims for the year. Doubtless, on the 1st of January, many neglected claims will be relocated, and the new owners will, in most instances, do more or less work on them to see what they are worth.

The eclipse of the sun, which occurs next Tuesday, is a very important astronomical event, and during this week final preparations have been made by many parties who intend observing it. Some of the parties are already on the field arranging their instruments, etc.

The rain has fallen very steadily all over the State for the past week, so there is now an abundance of water for mining operations. The snowfall in the mountains has not, however, been very heavy thus far.

The formation of an association to protect mining-stock owners, alluded to in another column, is an important move, and one calculated to be of great benefit if the work is carried on as at present intended.

Close of the Volume.

This number is the last one of Volume LVI of the MINING AND SCIENTIFIC PRESS. The index on the last page gives an idea to the casual reader, who is not familiar with the paper, of the scope of the contents, embracing, as it does, most branches of popular science, mining, metallurgy, mechanics, engineering, inventions, etc. Of late we have largely increased the number of engravings and intend to develop this feature still more fully. The market reports have been extended so as to meet the wants of the industrial classes, and this department will be added to as occasion demands. Our list of correspondents has increased of late, as our constant readers have, no doubt, noticed. It is the intention of the publishers and editors to still further improve the paper in several particulars. The MINING AND SCIENTIFIC PRESS is now the oldest mining paper published in the United States. It has been through all the "excitements" and depressions incident to mining in this country, and in so doing its publishers have gained an experience that is valuable to the reader.

It has always been, and will continue to be, our policy to gather available information concerning all new processes and appliances connected with mining and metallurgy and give detailed descriptions thereof. This feature alone should make the PRESS indispensable to all who are engaged in the mining industry, as it keeps them posted and abreast of the times.

Of course the more readers we have the better can be our influence and our work. We trust that those who have been readers for years will call the attention of others to the advantages of subscribing for the PRESS. It is our aim to publish a paper which shall contain from week to week more or less on many subjects which will be of interest and benefit to the progressive industrial classes of this coast. In this we need the aid of these classes themselves for mutual benefit.

Eclipse-Observing Parties.

As excursion trains are to be run from this city on Tuesday next to various points on the line of totality of the eclipse of the sun, large numbers of persons will be able to witness the phenomenon and will take advantage of the opportunity. In this city the eclipse will not be total, although about eleven-twelfths of the sun will be obscured. Aside from the small parties, and individuals, who will go to places within the lines of totality, there are several parties who go to make exact scientific observations, and who are supplied with all the necessary instruments and appliances.

The party from the Lick Observatory consists of Messrs. Keeler, Barnard, Hill, and a University student. They will have the portable six-inch Clark telescope from the Lick Observatory and the spectroscope belonging to the Chabot Observatory, Oakland. They are to photograph and examine the corona particularly. Mr. Keeler will use the spectroscope, and Mr. Barnard will attend to the photography. Mr. Hill will assist Mr. Keeler, and the student will make photo-metric measures of the light of the corona. This party will observe at Bartlett Springs, and some of them have been there for a week past making preliminary arrangements. Observations will also be made at the Lick Observatory by Prof. Holden and Mr. Burnham. The observatory will be closed to the public on the day of the eclipse.

Of the Harvard Observatory party, who will be stationed at Willows, Colusa county, several of the members have been on the ground for a month past. Mr. Bailey has made the preliminary arrangements. It is probable that Prof. Pickering will be in charge. They have, among other instruments, a 13-inch photographic telescope, and will photograph the corona and the spectrum of the corona. There are five members of this eclipse expedition.

Probably the largest party in the field will be that of the Pacific Coast Amateur Photographic Association. At a meeting of the association it was voted to give Mr. Chas. Burckhalter, an honorary member, and assistant in charge of the Chabot Observatory, Oakland, all the assistance possible, and for the members of the association to accompany him in a body to the point selected near Cloverdale, for the purpose of making photographic observations under his directions. There are about 40 in this party, 25 of

whom have first-class photographic cameras and appliances. This will be the largest body of photographers ever brought together for scientific observations of this character. All of them are skillful in outdoor work and have been preparing for this for some time. Mr. W. H. Lowden, an accomplished amateur, will take a very large camera with a 3-inch lens and 22-inch focus, with special apparatus for following the corona during the time of exposure. The camera is arranged carefully on an equatorial mounting. Mr. Burckhalter will take with him a 10½-inch reflecting telescope made by Brashear. This Newtonian reflector he has converted into a photographic camera; special apparatus have been constructed to obtain a large field. The main observations will be photographic drawings of corona, meteorological changes during eclipse, etc.

In this party are several lady artists who will draw the corona in colors. There will be several telescopes, barometer, thermometer, hygrometer, anemometer, etc., so that exact observations can be made. All the work will be done under the direction of Mr. Burckhalter. He, with four others, leave here Saturday to establish the latitude and longitude of the stations and make preliminary arrangements. The rest of the party will leave the city on Monday, and will practice for their work on Tuesday morning. It is probable that the point selected will be a hill about a mile and a half from Cloverdale. Representatives of the MINING AND SCIENTIFIC PRESS are attached to this party and will assist with the instruments in making the observations.

Prof. George Davidson is absent at Los Angeles measuring the base-line, and will be unable to observe the eclipse, as he had expected. His son, Thomas Davidson, will, however, be in charge of a small party of observers at Winnemucca mountain, Nev.

F. G. Blinn of East Oakland will take his five-inch Clark refractor telescope to Winnemucca mountain.

Prof. Prichett will be in charge of the party from Washington Observatory, at Willows, Colusa county. They have a Clark four-inch refractor telescope and will make a special study of the corona and observe contacts. Prof. Nipher will have charge of the photographic instruments. They have a large camera, an equatorial mounting, the same one used by Prof. Prichett in 1882, when observing the transit of Venus in New Zealand. Mr. Engle of this party will make pencil sketches of the corona.

It is stated that a corps of observers from Amherst College Observatory, in charge of Prof. David P. Todd, will be stationed near Winnemucca mountain, Nevada.

J. A. Brashear of Alleghany, Pa., the famous optician who made the great spectroscope for the Lick Observatory, has telegraphed a friend here that he will make observations of the eclipse at Winnemucca, and afterward make his first visit to San Francisco.

A party of five of the class of '88, University of California, intend going to Yankee Hill, Butte Co., not far from Oroville. They will take two two-inch telescopes and a camera. This party consists of W. E. Downs, R. Drew, O. B. Ellsworth, T. Palmer and C. W. Hilleglass.

Two students of the class of '89, University of California—Messrs. Carson and Bakewell, will observe near Cloverdale.

James P. Jones of Oakland is organizing a party to go to Mt. St. Helena, Napa Co., and will take suitable instruments for exact observations.

Alexander Badlam with a party of 20 will visit one of the high peaks in Lake county with apparatus for photographic and other observations.

U. S. Surveyor-General C. W. Irish of Nevada will observe at Liegar Station, Nevada & Oregon R. R., in Nevada. This gentleman observed and photographed a previous eclipse, and has made extensive observations for this one.

THE Idaho gold mine of Grass Valley, Nevada county, this State, has produced altogether \$10,400,000. The yield for the past 11 months is about \$600,000. The month of January, 1888, very little was produced, owing to the water ditch being blocked by ice. The width of the pay chute has doubled in the past year near the Maryland mine adjoining.

Special Phenomena During the Eclipse.

A great many people will go from this city to some point on the line of totality of the eclipse on Tuesday, who scarcely know what there is to see aside from the mere temporary observing of the sun. In last week's PRESS were given the main facts of interest concerning the coming eclipse—suggestions for observers, by Prof. Holden, director of the Lick Observatory. But there are also special phenomena to which Prof. Holden calls the attention of those who intend observing closely. Those specially interested should look out for the following mentioned phenomena:

Near Beginning and End of Eclipse.

(1) Visibility of the limb of the moon before it touches and after it leaves the sun, and the time and distance at which it is noticed.

(2) Apparent agitation of the sun's limb near the point of contact immediately before and after the eclipse.

(3) Whether the contacts are instantaneous and well defined, or whether there are apparent adhesions and distortions, formation of heads, or portions of the moon's limb separated by dark lines or other irregularities of outline.

During Progress of Eclipse.

(4) Projection of the moon beyond the sun; time and extent to be noted.

(5) Irregularities of the moon's limb. Distortions of the solar cusps, their color and shading.

(6) Bright band bordering the moon's edge; color of the glass screen through which the moon is best seen.

(7) Flashes or coruscations of light across the moon.

(8) Any peculiarities of the illumination and color of the moon's disc or any portion of it; spots which may be visible.

(9) Any peculiarity in the appearance and color of the solar spots, especially near the edge of the moon.

Near Instants of Total Immersion and Emergence.

(10) Rapid change of the last visible portion of the sun, or of that which first reappears; a separation into minute parts, or formation of Bailey's heads, with dark lines among them.

(11) Any increased brightness of the moon's edge, and when and where it is noticed.

(12) Flashes, rays, or bright points as the sun disappears or reappears.

(13) The approach and recession of the shadow, appearing on the ground like that of a cloud, should be watched by those who are not occupied with other observations; and any peculiarities described, as for instance, whether its appearance and motion are uniform, or if dark stripes appear flitting across the landscape; if these are seen, their distance apart, width, and velocity should be noted.

During the Total Phase.

(14) The general appearance and extent of the corona; when and where it first appears and disappears; whether uniformly surrounding the moon's disc, or brighter and more extensive on one side, especially where the sun has just disappeared, or is about reappearing; its color in different portions; its shading, and whether separated into two portions, one brighter and shaded uniformly, the other radially striated; its changes.

(15) Prominences or protuberances along the edge of the moon, with their position, form, extent, color, and any other peculiarity; also their formation, growth, and any other changes. The position and extent should be noted on a diagram previously prepared.

(16) Colors of the clouds or fog, and especially a note of the changes of color.

If there are several observers with telescopes, it is desirable that one should keep the whole corona in view, while each of the others confines his attention to some designated portion. Those without telescopes, or supplied with opera glasses or spy-glasses, should also note the appearance, extent, and peculiarities of the corona, as it appears to them.

(17) A comet may possibly be seen near the sun, or an aurora be visible.

THE Reno Gazette says: Senator Stewart telegraphs Charles Friend of Carson that a bond for \$3000 has been forwarded to that city, and as soon as it is returned with proper signatures, the new telescope for the Observatory will be shipped.

A Mining Stock Association:

Probably one of the most important movements of the present day is that of representative mining men, organizing to see that the Comstock mines listed on the stock exchanges are worked in the interest of all stockholders, and not for a limited few. The organization is called the Mining Stock Association, and for the present the head office is in room 10, old Odd Fellows' building, 325 Montgomery street. The association is composed of bona-fide mining-stock owners, who have become tired of expecting reform in the mining-director system of working mines on the Comstock.

The first move to abate this evil was made the past week, in bringing an action in the Su-

preme court to make daily visits, or as often as desired, in the mines and report on the same in their official capacity.

By this course the association expects it can prevent a development being concealed, unduly magnified or belittled, as is now done in the interest of the stock manipulators. The association has, at this writing, a membership of 135, with every day bringing in new members—persons of standing and character in the community. If they succeed in righting, and there can be no doubt but they can, the wrongs claimed to be so persistently carried on in the management of the mines, there can be no doubt but moneyed men will not fear to invest in mining shares, for the Comstock mines are rich in mineral ore, and if properly

Incline Railways.

One of the problems which mining engineers have occasionally to solve is that of the best method of bringing ores up or down inclines, where ordinary teaming is impossible. One of the successful incline railways of this country is that at Lookout Mountain, near Chattanooga, Tennessee. We gave some facts concerning the length and general plan of this road in the PRESS of December 1st from a description by Mr. Adams, and in this number present some engravings showing details, which will interest mining and civil engineers.

The rails are of steel, 25 pounds to the yard, and laid on cedar ties nine feet long. No spikes are used, the rails being secured by

driving cable is one inch in diameter, with the same number of wires. The sheave at the summit is held in place by a wooden frame anchored to masonry piers which rest upon and are bolted to the original rock. Fig. 4 shows a section and elevation of the engine-house and plant.

The engines, built by Wheeland of Chattanooga, have two cylinders, 12x18 inches, connected to the main shaft, and a 20-inch steel pinion and two 80-inch gear-wheels actuate the two 80-inch double and triple-grooved driving sheaves.

The lead of the cable passes around the driving sheaves, as shown in Fig. 1, and around a pair of smaller sheaves, fixed in a sliding frame to which is attached a counterpoise, serv-

FIG. 1.—LOOKOUT MOUNTAIN RAILWAY, VIEW FROM LOWER TERMINAL.

perior Court of this city, to test the validity of the Mining Act, passed by the Legislature in April, 1880, to regulate the voting of stock by proxy. This law was enacted to reform the system of mines being controlled by dummy directors, who would sell or otherwise dispose of the ores in the mines to the mill rings for a mere trifle. It has so far proven a dead letter, for what is every person's business is no one's, but now in union the object can be accomplished. If the law is declared constitutional, then mine elections can only be carried by actual holders or owners of stock, and not as is now done—by brokers' proxies.

Another wrong the association proposes to right is to insist that the Comstock mines be worked to the best possible advantage, and also that the grading of ores so as to reduce their value, by which more milling can be secured to mill-owners, be done away with. The association intends to have their own experts, men of large experience and thorough reliability,

worked ought to pay large dividends for a long time to come.

SOME Chinamen near Coulterville, Mariposa county, have been taking out and shipping to China a peculiar quartz that is found there. The quartz is not vitreous in appearance, but looks like loaf-sugar. It is apparently barren of mineral, and the Chinese will not tell what it is to be used for. They have shipped altogether about 10 tons, and are taking out more.

ALUM.—The Salt Lake Herald says: An alum mine was discovered last week on the banks of the Sevier river, near Marysville. The vein is 50 to 75 feet wide and is from 80 to 90 per cent pure. The alum can be extracted by simply placing the crude material in boiling water.

THE Nevada Tribune says: The losses by discount on silver bullion from Norcross amounted during the past year to \$123,768 53, and the Sutro tunnel royalty to \$32,398 86.

heavy lag-screws five inches long, the heads of which are reinforced by wrought-iron washers 2x3 inches, which grip the base of the rail.

The cable consists of two sections. The upper one, 4360 feet long, and depended upon for the real work, is passed over an eight-foot sheave at the summit, and to its ends are attached the two cars, giving the well-known balanced hoist where power is applied at the upper end. In this case, owing to the necessity for applying the power to the lower end of the system, the ends are spliced below the cars to the two ends of a second section of cable, thus forming a continuous driving-rope. The center of the lower section passes over the grooved driving and tightening pulleys, arranged as shown in Fig. 4.

A large surplus of strength is allowed for in the upper or working cable, the maximum load being five tons, while the breaking strain is 50 tons. This cable is 1½ inches in diameter and composed of six strands of 19 wires each. The

ing to keep the cable uniformly taut, and allowing for changes of temperature or strains of any violent nature. The engines are controlled absolutely by a system of levers extending into the tower of the engine-house, the engineer having an unobstructed view of the cars at nearly all points on the line.

The boilers carry 75 pounds working pressure, and consume from 1600 to 2000 pounds of bituminous coal per day (the cars making from 18 to 24 trips) or about 90 pounds of coal per round trip. The throttle, an ordinary 4-inch globe valve, is only opened from one to two-thirds of a turn for the heaviest loads, while the full opening requires five complete turns. With this small amount of steam the engines make about 160 revolutions per minute, the valves being set to cut off at two-thirds stroke. The expenditure of power is surprisingly slight, when account is taken of the stiffness of cordage, weight of cable resting upon and moved rapidly over 150 grooved pulleys, passed at

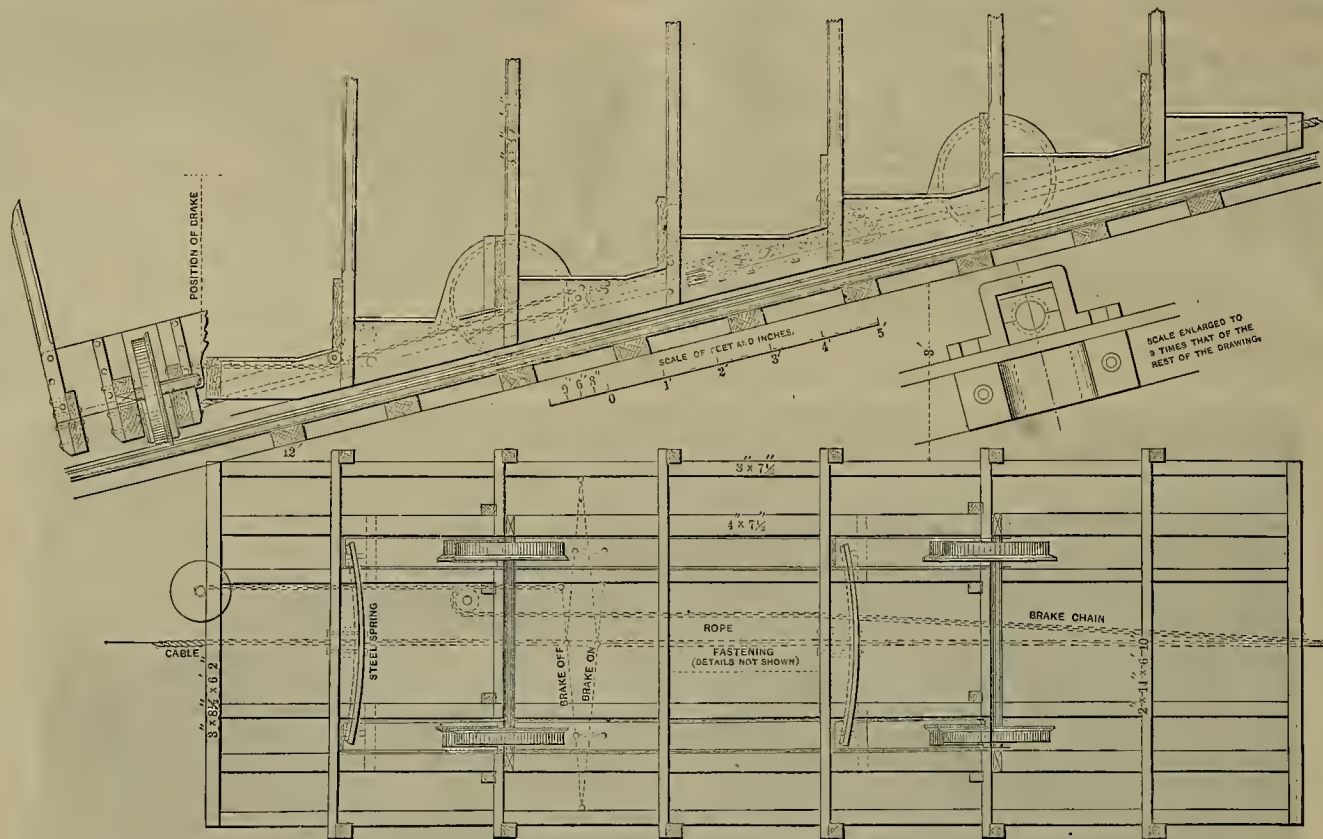

FIG. 3—DETAILS OF BRAKE FOR CAR USED ON INCLINE.

right angles through the power-plant, head and tail pulleys, etc.

The importance of telegraphic relations between the cars and engine room was duly considered, and a very simple plan was devised by which either conductor can signal directly to the engineer from any part of the line whether the car is moving or standing still.

The arrangement may be readily described without drawings, as follows: A small eight-cell Leclanche battery and an electric gong are located in the engine-room. One pole of the battery is connected with a hearing of the main sheaves and thus with the cable, which forms the ground circuit. The other pole is connected through the magnets of the gong to an ordinary telegraph wire stretched between the rails and supported by insulators that do not rise above it, the wire being about six inches above the ties. To complete the circuit all that is necessary is to connect this wire with the cable, and this can be done at any point of the line by pressing a spring upon the wire, the other end of the spring being connected with the cable where it is attached to the car.

To guard against mistakes or possible failures to make the proper signal when in motion, it is understood that any signal whatever, when the engine is in motion, means "stop!" but a "start" requires a certain definite signal which can, of course, be easily and deliberately made, as the car must be standing still when such a signal is required. This last signal is such that it could hardly be counterfeited by accidental contact of the wires or by malicious persons. It should be noticed that, even if the cable were to be broken at any point, there will always be a connection one way or the other back to the engine-house, and if a car should jump the track the spring would come in contact with the insulated wire and thus give an instant signal to stop the engine.

Fig. 2 shows the construction of the cars, which were built as low as possible, and are provided with a special form of brake shown in Fig. 3. This brake acts in an entirely different manner from the common style of car-brake, the conductor being obliged to hold it off during the entire trip, or whenever the car is in motion. If, by accident or design, the hand-wheel is released, the brake is instantly forced under and against the front of each wheel, so as to lift the wheels entirely off the track, thus converting the car into a sled, of which the brakes are the runners.

The bottoms of the brakes now have soles of wrought-iron with short steel pins (24 in number) projecting slightly from the surface and sharpened like an engraver's tool. It is proposed to try a shoe with a V-shaped groove to take the head of the rail, the amount of

FIG. 2—CAR FOR LOOKOUT MOUNTAIN INCLINE.

friction being increased by the sharpness of the angle into which the head of the rail will be wedged by the weight of the car and load.

An automatic attachment causes the brake to set in the same manner in case the cable should part, even if the conductor should continue to hold on to the wheel; and still another and independent automatic grip is contemplated, to be actuated by a governor attached to the car axle.

It should be added that the springs which actuate the brakes are not required to be bent more than six to eight minutes at a time, and will not be likely to take a "set," as is the case with springs on some forms of hoisting machinery which are kept under strain for months at a time.

Fig. 1 is a view from the lower terminal, showing in perspective nearly the whole of the line. By comparison with the engravings given in the Press of Dec. 1, 1888, these give a good notion of the work and of the topographical difficulties surmounted.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers and other ore crushing machines now before the public.

HOISTING ENGINES FOR MINES.

**HOSKIN'S
IMPROVED
ONE-JOINTED
HYDRAULIC MACHINE.**

The statement of Mr. Joshua Hendy that ANY STYLE of machine is an infringement on any style manufactured by him, he knows to be absolutely false. The Supreme Court of the United States on March 19th decided that the pretended patent for infringing, which he has for years been fleecing miners for royalty, is ABSOLUTELY VOID, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. R. HOSKIN, Empire Foundry, Marysville, Cal.

THE CALIFORNIA CONSOLIDATED
Gold Mining Company, Sierra City, Cal., A. Schubert, President, Alvin Fischer, Secretary, A. Leder, Superintendent. Divided into 300,000 shares at \$1 each. Property comprises two locations. Ore assays \$7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide. Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

THE BUFFALO CONSOLIDATED GOLD
Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at \$1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No. 1, 32 ft.; No. 2, 21 ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

WIRE WORKS.

Buildings and Steamships Wired for all Systems of Electric Lighting. Telephone No. 1508.

THE DUCKER PORTABLE HOUSES

Combine all the comforts and advantages of a permanent building with the qualities of simplicity, stability, lightness, ease of transportation, quickness of putting up and taking down, ventilation, heating, and facility for cleaning. Equal

ly serviceable for Contractors' Uses, for Sheep and Cattle Ranches, Mining camps and for Surveyors and Prospectors, Hospitals, Seaside and Summer Resorts, and in all localities where material and skilled labor are scarce, and where it is sometimes desirable to change location. These Buildings can be especially constructed for Hunting and Fishing Camps, Billiard Rooms, Photographers' Studios and Lawn Pavilions. They are built in sections and are put up without the use of screws, nails or any external appliances whatever. Two men can put up the building on ordinary ground in 2 hours' time with out skilled labor. Price, \$250 to \$750. Thoroughly reliable and influential business men only, may communicate with this company relative to its representative. Address **DUCKER PORTABLE HOUSE COMPANY, 32 Nassau St., New York.**

Telephone No. 1508.

Photographs of the Eclipse.

A great many photographers are preparing to use their cameras during the eclipse next Tuesday, and it is probable that more photographs will be taken during this phenomenon than has ever been the case at a preceding one. With one party alone which goes to Cloverdale there will be 25 cameras, one of them an exceptionally large and fine one. All of the parties which go to make exact observations will have one or more cameras. Many of the negatives will be sent to the Lick Observatory, and engravings will be made from them.

Photographs of the corona of very considerable scientific value can be made with an ordinary photographic apparatus and dry plates. With this view the camera should be filled with the largest and longest focused lens to be obtained, and then should be carefully focused with the full aperture upon some distant object. The image will be well defined over a small space in the center of the ground glass only. Two or three minutes before totality, six or eight plates should be in readiness. The ordinary tripod will scarcely do to support the camera, as the sun will be at considerable altitude.

The focus of the lens remaining as it was when adjusted on the distant object, as soon as totality commences and the operator has assured himself that the image of the corona is in the center of the ground glass, the plate may be exposed. By using a finder, many plates may be exposed during the totality, as time will be saved in knowing exactly when the image is in the center of the plate.

Valuable experience may be gained by photographing light clouds away from the sun, or near the sun, when it is obscured by heavy clouds, or just after sunset. Several exposures made in this way will show which one is best suited to give all the details of cloud forms, and this exposure (and stop) is best adapted for photographs of the corona. With the full aperture of a portrait lens, the maximum time should not exceed five seconds. One plate should be exposed with the smallest stop and the shortest time with the cap; another with the same time and an intermediate stop. By thus varying the amount of light received by the plate, there is more likelihood of obtaining a successful picture, showing the delicate details of the corona.

On account of the motion of the earth while the plate is being exposed, the image of the sun—or rather of the moon which covers the sun—will be a little blurred and somewhat oval in shape on the negatives; but it must be remembered that the portrait lenses in ordinary use have such short foci that they can give but very small pictures of the moon. The actual size in inches will be nearly as follows, viz.: With a 1-4 lens (focus about 5 inches), 0.04 inches; with a 1-2 lens (focus about 8 inches), 0.07; with a 4-4 lens (focus about 10 inches), 0.09; and with an extra 4-4 lens (focus about 16 inches), 0.14. The diameter of the extreme outlying portions of the corona may be four or five times these figures.

It is hoped that photographers making pictures in this manner will send the original negatives to the Lick Observatory; but if they prefer to retain them, it is earnestly requested that they will, at least, send positive copies on glass. Paper prints are useless for scientific purposes.

Each plate should be accompanied by a statement of the kind of lens used in its production; the focal distance and aperture of that lens; the diaphragm employed; the kind of plates used; how long each plate was exposed, and the means of identifying the top. The latter point is of especial importance, and the upper side of every plate must be carefully marked when it is put in the holder, because the character of the corona is such that without this precaution it may be impossible to say certainly which is the top of the negative.

It is desirable, though by no means essential, that every photographic observer should be provided with an assistant to record for him. The record should be made in pencil, on pieces of white card-board, cut to a convenient size. Each observer should be provided with colored or smoked glass to view the sun during the partial phase, so that he may not be dazzled, and lose precious time when the totality comes on. A couple of photographs of the sky, taken just before and again after totality, will be in-

teresting to show the position and motion of the clouds. For these negatives the smallest stop should be used and the time made as short as possible—preferably with an instantaneous shutter.

When great accuracy is not necessary, the simplest way to orient the pictures is to take a couple of instantaneous views of the sun 15 or 20 minutes before totality, and about one minute apart, upon the same plate (the driving clock of the telescope being stopped in the meantime, if the camera is mounted on a telescope stand). Take two more about the same interval after totality. The mean direction of motion of the cusps on these two plates should give the direction of the circle of declination during totality, within 10 or 15 minutes of arc.

The plates should be numbered with a soft pencil on the corner of the film before removing them from the plate-holder. The intended exposure for each plate should be indicated in large white letters on the slide. The black tablet slides are very convenient for this purpose, as the figures may be chalked directly upon them.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VINEYARD OR FARM HOE.—Edgar Cartwright, Lincoln, Placer Co. No. 394,641. Dated Dec. 18, 1888. This hoe is specially adapted for use on farms or vineyards. The object is to provide a simple hoe, the blade of which may be readily attached or detached from the handle for sharpening, or the substitution of another blade.

CAN TESTING MACHINE.—Wm. H. Smyth, Berkeley, assignor to King-Morse Canning Co., S. F. No. 394,664. Dated Dec. 18, 1888. This is a machine for determining whether the seams of cans have been properly soldered before they have been filled. It consists of an inclined rotary table or carrier, into which the cans are placed, one side of this carrier passing beneath the surface of hot water in a containing tank, so that as the cans are carried beneath the water, escaping bubbles will indicate the leaky ones. It consists also of a mechanism for discharging and drying cans, a mechanism by which the defective cans may be separated from the good ones and discharged into another chute, and in certain details of construction. The defective cans are discharged automatically and separated from the good ones.

STREET OR STATION INDICATOR AND CARD-DISPLAYING DEVICE.—Wm. A. Turner, S. F. No. 394,741. Dated Dec. 18, 1888. The object of this device is to construct an appliance which shall utilize all the space in the indicator-box for the successive display of cards or signs bearing names or other matter. The invention consists essentially of a box or case whose front, with the exception of a small space at the upper left-hand corner, is transparent and which is filled, or nearly filled, by two sets of advertising cards or plates, together with mechanism by which one set is forced toward the front and the other toward the rear of the box, and, in combination with this, of pulling grips by which

the front plate is pulled to one end and the rear plate is pulled to the opposite end, the two being simultaneously drawn in opposite directions together, with the mechanism for operating the same.

DEVICE FOR ACTUATING STATION INDICATORS.—Wm. A. Turner, S. F. No. 394,799. Dated Dec. 18, 1888. This is a mechanism for actuating station indicators; and it has for its object the conversion of the sudden strain resulting from the striking of the actuating device against the tripping device or obstruction in the roadway into a prolonged and uniform pull and avoidance of erroneous indications through the hacking or irregular motion of the car. It consists of one or more tripping blocks or obstructions at the point upon the track where the indication is desired, a lever or levers fulcrumed upon the car so as to be actuated by these obstructions, a screw fixed upon the revolving car axle, and a device which is caused to engage the screw by the movement of the tripping-levers and through which the indicator is actuated.

GOLD-SAVING APPARATUS.—Olin H. Bagley, Knappa, Oregon. No. 394,636. Dated Dec. 18, 1888. This apparatus comprises a fixed bed frame, a shaking frame suspended from and above the fixed bed frame, and a third frame suspended from and within the shaking frame, so that it receives a peculiar movement due to the movement of the shaking frame and the bumping it receives from it. This third frame carries one or more concentrating tables, the surfaces of which are corrugated or fluted, and each has discharge openings in its ridges or elevated portions. The frame also carries a screen-plate, between which and the concentrating table is a perforated directing plate to guide the material directly into the hollows of the table. By the shaking movement of the table, the precious particles are settled in the hollows while the worthless material passes through the openings in the ridges.

BALING PRESS.—Jacob Price, San Leandro. No. 394,662. Dated Dec. 18, 1888. This press is of the horizontal type and is mounted on wheels so as to be easily transported. It has a central double-header follower and mechanism for operating the same, so that each end of the follower acts alternately to compress the hay in its end of the press-box. Each of these ends has a feed opening or well with a door which may be closed when the well is full and ready for the follower to act on its contents, and which is opened automatically by the follower after the hay has been forced beyond the feed opening and before the follower returns. By the time the horses have been reversed on the lever the other end of the press is ready to receive another charge and may again be filled. This process is repeated until there are, for example, three charges in one end, which will complete the bale, and two in the other end, and the driver may leave the horses and assist in tying the completed bale. While this is being done the third charge for the other bale is being put in by the feeder. The instant the first bale is tied the horses are started and it is discharged, and the last charge being pressed in the opposite end, the other bale will be ready to be tied. While this is being done the empty end of the press receives its first charge for the second bale, and so the process is continued without loss of time. By the peculiar arrangement of the mechanism for actuating the follower, the latter may be given a long travel and moved at considerable speed during the first portion of its travel when power is not necessary, and the whole power of the team is concentrated at the end upon the last portion of its movement.

Testing and Working Silver Ores

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the heading of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride of iron, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the heading of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroeck's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quick-silver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Sold by DEWEY & Co., Publishers, 220 Market St.

About Obtaining Patents.

Patents are Virtually Contracts.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. If, by this "preliminary examination," the improvement is found to have been previously invented, our client will receive, for the small sum of \$5 for the examination, a verbal or written report showing definitely wherein his invention has been anticipated, thereby saving him further expense and perhaps much time, anxiety, etc.

To avoid all needless delay, however and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with \$15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the inventor for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of \$20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds \$40, and for this we do all we can without appealing the case.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bulk of countless models.

Drawings or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. has edited and published the MINING AND SCIENTIFIC PRESS continuously since 1860, a period of 28 years. Few agents, who are still engaged in the business, have had so long-extended practice in patent soliciting. The members of the firm give personal attention to the applications entrusted to their care; and their familiarity with inventions and with local affairs in the Pacific States and Territories, enables them to understand the wants of inventors on this coast more readily and thoroughly, as we believe, than any other agents in America. Thus there is saved a great deal of the time which ordinarily—when distant agents are employed—is wasted in preliminary writing back and forth.

This happy combination of long business experience together, and wide connections, has placed our firm in a position unquestionably most fortunate for affording inventors prompt and reliable advice, and the best facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation best calculated to widely inform the class of readers especially interested in the subject of his invention.

Caveats.

A caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the inventor to receive notice, for a period of one year, of any application for a patent subsequently filed, which is adjudged to be novel and is likely to interfere with the invention described in the caveat, and the inventor is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from \$10 to \$25. The Government fee is \$10 additional. To enable us to prepare caveat papers, we require only a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves or for them by other agents) and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors doing business with us will be notified of the state of their application in the Patent Office whenever it is possible for us to furnish such information.

BRYAN'S ROLLER QUARTZ MILL,

The most perfect Roller Mill made, for the following reasons:

1. It is cheaper.
2. It is more durable.
3. It crushes a larger amount of ore with less power.
4. It amalgamates a larger percentage of the gold.
5. Its "clean-up" is quicker and fuller.
6. It is portable, requires no frame-work, and is ready for the foundation as it leaves the shop.

Full Descriptive Circulars of any of the above sent on application.

OFFICE OF THE CADELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

Risdon Iron Works, San Francisco—GENTLEMEN: Our Company has been operating three of the 4-foot Bryan Roller Quartz Mills one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard, we crush through a No. 60-mesh screen. Our mills run 55 revolutions per minute, and each crush through 80-mesh screen 12 tons in twenty-four hours; through 50-mesh, 15 tons; and through 40-mesh, 18 tons. This proportion has been continuous. One set of Dies will crush from 1500 to 1600 tons. One set

of Tyres will crush 1600 tons. One ring plate will crush from 2200 to 2300. The mills require very little attention. At our mill an ordinary "peon" earning one dollar per day has complete charge. In regard to slitting, in comparison with stamps by reason of the discharge surface and the continuous agitation by the scrapers, a much less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success and of material benefit to the mining world. They can be set up and running in 48 hours, and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator, it is unequaled by any mill now in existence.

Yours truly,

D. M. BURNS, Superintendent.

MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES,

THE GREATEST ROCK CRUSHER ON EARTH!

WHAT IS SAID OF IT BY ONE WHO HAS USED IT THREE YEARS.

OFFICE OF ERNEST L. RANSOME, MANUFACTURER OF ARTIFICIAL STONE AND CONCRETE,
No. 508 CALIFORNIA STREET, SAN FRANCISCO, November 9, 1888.

Pacific Iron Works—GENTLEMEN: In answer to your request for my experience with the Gates Crusher would say, that I have used one for the past three years crushing trap rock, basal, and granite for making concrete, the most of it being very hard and calculated to test severely the strength and durability of any machine.

I have crushed in that time probably not less than 10,000 tons of this material, without any repair being necessary, and without any change of shoes and dies, and, as far as I can judge, they appear to be good for as much more service.

I have had more or less experience with nearly every crusher in the market, and regard the Gates as infinitely superior to them all. In fact its efficiency, durability and capacity for work is simply wonderful. For crushing all kinds of ore, ballast or macadam—fine or coarse—nothing can compare with it. You are at liberty to refer any parties to me who may want further evidence as to the merits of this remarkable machine. Very truly yours,

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Dec. 27, 1888.

General business the past week was as usual at the close of the year of a holiday character. This inactivity is expected to obtain until after the turn of the year. Owing to the easy money market and a more general accumulation of funds after next month from interest and dividend disbursements, there is a growing impression that the forepart of 1889 will show more general activity in all branches of trade and industries than witnessed for some time. Considerable money was paid out the past two weeks for taxes, but then this is not felt in any one quarter. The various machine, foundry and iron works in general, anticipate a more active time in the near future. Cheaper coal is assured by new freights from Australia, which will be quite a factor in bringing about the improvement. Heavy deposits of snow in the mountain ranges assure a liberal supply of water for the mines well into 1889, and with a better system of working many of the mines, a very prosperous season is looked for. The Mining Stock Association, counting as it does several very wealthy members, proposes rectifying the abuses that have crept into the management of the Comstock mines. This action on the part of the association is already being favorably felt. Another important factor for the future prosperity of the Comstock is the final settlement of the Suto tunnel on Jan. 1, 1889. After that date the tunnel will pass into the control of parties who propose pushing the work and developing the property for the best interest of the Comstock mines. The tunnel is to be extended west through and from the Savage ground. News from the various mining districts is of the most flattering character, auguring well for a prosperous year in 1889. This is particularly the case from the Comstock, where the mines are being opened up for the taking out of increased quantities of ore from the older mines and the development of others not now listed on the stock exchanges, particularly those located on the West or Red Lode. News from Virginia City reports another important development in Con. Virginia, and also that the Crown Point developments are proving larger and richer than before claimed. Work in the other mines is being vigorously prosecuted, but kept as quiet as possible, probably for stock manipulation purposes. From the Tuscarora, Quji-ton and Bodie districts there is nothing of particular interest to report further than they are preparing for an active season.

SILVER—The market has been steady and firm throughout the week at 92½ to 93½. The supply of bullion continues light, but a decided increase is looked for in next month owing to all the mills on the Carson river now running to full capacity and the other mills in the district either running to full capacity, or will be very soon, unless for stock manipulation purposes they are delayed.

QUICKSILVER—The market is very firm at advance. The demand is reported to be exceedingly good. The consumption next year is expected to be fully 25 per cent greater than that of 1888.

LEAD—The market shows a steady and fairly firm tone. Some increase in the inquiries is reported from consumers, but no marked improvement in the demand is looked for until the coming season opens. Eastern mail advices are not encouraging to the selling interest, causing an easier tone to prevail.

COPPER—The market is inactive. Confirmed reports are received of more mines being opened up in Nevada and Arizona. Mail advices from the East report a steady increase in the visible supply of copper, which creates in certain quarters a bearish feeling, causing more cutting in the market prices for manufactured copper and brass goods. The syndicate stock of copper at the moderate price of \$50 per ton reaches the sum of \$25,000,000.

TIN—Pig tin begins to be taken more freely. Spot tin plate is firm, as is that nearly due and to arrive in the spring. For prompt shipment, the market is reported to be easier. The consumption in 1889 will be fully 20 per cent more than it was in 1888.

COAL—Spot house coals are weaker under heavy receipts. Steam-coals are reported firm by sellers, but consumers report the market easier for both spot and on passage. For prompt shipment prices are lower and irregular owing to a decline from Australia freights to this port. It now looks as if 1889 will witness very low prices to what they were in this year, for both steam and house coals.

IRON—The market continues dull and inactive, with quotations more or less nominal.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Dec. 27, 1888.—The following are the closing prices the past week:

	Silver in London	Silver in New York	Copper.	Lead.	Tin.
Thursday	42 5-16	92 3/4	\$17 20	\$3 75	\$21 80
Friday	42 5-16	92 3/4	17 25	3 80	21 80
Saturday	42 5-16	92 3/4	17 40	3 76	21 76
Sunday	42 5-16	92 3/4			
Tuesday	42 5-16	92 3/4			
Wednesday	42 5-16	92 3/4	17 20	3 20	21 80

Quicksilver is unchanged. Borax is steady and in fair demand. California refined would bring 7½ c. Copper is dull and nominal at 17½ to 17¾ c; casting, 16 to 16½ c. Pig lead was dealt in in a small way at 33.72½ to 33.50. Large consumers are unwilling to pay \$3.70. Petroleum is dull. Refined, barrels, \$7.30; plain cases, \$9.20.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, @—; Billiton Tin, \$24.50; Banca Tin, \$24.25 to \$24.50; Baltimore Copper, @—; Orford Copper, \$16.00; 16.25; P. S. C. Copper, @—; Foreign Lead, \$4.75 to \$5.00; Foreign Spelter, \$5.00 to \$5.25; Antimony, \$10.00 to \$13.50.

San Francisco Metal Market.

Mining Share Market.

The dullness of holiday week in ordinary business circles has scarcely added to the dullness and inactivity of the stock market, for there is not much room for anything in that direction. The market has been flat for a long time, notwithstanding encouraging work up on the Comstock. Monday's Virginia Chronicle says: The flow of the Carson river has been augmented by the recent snow and rainfall to a volume sufficient to operate all the stamp mills along its course to their full capacity. It is probable that there will be a material increase in the daily ore shipments from the Hale and Norcross and Confidence. The Con. California and Virginia has already increased its daily ore shipments to the Eureka from 168 to above 200 tons. The fall of snow in the mountains has not yet been of sufficient importance, however, to keep the Carson bank full for a prolonged period.

Coll Deane, Robert F. Rogers, R. W. Collins and M. W. Fox have filed a complaint in the Superior Court against the Challenge Mining Co. to set aside the election of A. K. P. Harmon, J. D. Fry, William Norris, J. H. Dohneon and James Newlands as directors of the Challenge Consolidated Co. The petitioners allege that they were elected by proxies given by a number of stock brokers who were not bona-fide owners of the stock which they purported to represent at the time of the election. This is a test case, and a very important one to owners of mining stock, as it is intended to remedy an existing evil. Some of these days we will succeed in getting the mining companies conducted on a better basis than is at present the case, when mining stocks may be dealt in with better results by small holders.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive farther reports:

Confidence, Dec. 23, \$32,437; Overman (for December), \$3458; Challenge, 23, \$8906; Peerless, 27, \$5885; Mt. Diablo, 27, \$7945; Hale and Norcross, 25, \$15,592; Con. California and Virginia, 25, \$46,880—total to date on December account, \$106,977; Pamlico, 22, \$36,000; Hanauer, 18, \$3600; Queen of the Hills, 19, \$2200; Hanauer, 19, \$1830—20th, \$1900; Woodside, 20, \$10,200; Hanauer, 21, \$1675; Crescent, 32, \$6400; Woodside, 24, \$5830.

Those who simply want to look at the eclipse without instruments can prepare a piece of ordinary smoked glass. This can be made of a small pane of good window-glass by holding it over the flame of a lamp or candle until a black film is deposited. If possible, it should be smoked so that the tint will be so dense at one end that the full light of the sun seen through it will not dazzle the eye, while at the other the film should be so thin that objects in an ordinary lighted room may be seen distinctly through it. Smoke the glass as evenly as possible from one end to the other. Paste a narrow strip of thick paper across each end of the glass, on the smoked side, and lay it on a sheet of unsmoked glass of the same size. Then secure the two sheets together by a strip of paper pasted around the edges of both plates.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Assessment Notices.

Gover Mining Company—Location of principal place of business, San Francisco, California.
Location of works, near Drytown, Amador County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors held on the 24th day of November, 1888, an Assessment (No. 1) of Fifteen (15) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Nos. 13 and 15 Fremont street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 5th day of January, 1889, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the 29th day of January, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

L. G. HARVEY, Secretary.
Office—13 and 15 Fremont Street, San Francisco, Cal.

Lord of Lorn Gold and Silver Mining Company. Location of principal place of business, City and County of San Francisco, State of California. Location of works, Cold Hill Mining District, State of Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 19th day of December, 1888, an Assessment (No. 4) of Ten (10) Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 313 California street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 21st day of January, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Monday, the 11th day of February, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

L. G. HARVEY, Secretary.
Office—313 California St., San Francisco, Cal.

DELINQUENT SALE NOTICE.

William Penn Mill and Mining Company. Location of principal place of business, San Francisco, California. Location of works, Devil's Gate Mining District, Lyon county, Nevada.

NOTICE.—There is delinquent upon the following described stock, on account of Assessment (No. 3) levied on the 8th day of November, 1888, the several amounts set opposite the names of the respective Shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Langridge, George.	30	1000	\$100 00
Langridge, George.	37	1000	100 00
Langridge, George.	38	1000	100 00
Langridge, George.	34	1000	100 00
Langridge, George.	54	1000	100 00
Langridge, George.	55	1000	100 00
Ledden, J. A.	46	20	2 00
Seawell, W.	48	2000	200 00
Seawell, Bullitt.	30	500	50 00
Seawell, J. M.	49	2500	250 00
Scoville, J. J.	33	10,000	1000 00

And in accordance with law, and an order of the Board of Directors, made on the 8th day of November, 1888, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the Company, Room 59, Nevada Block, No. 309 Montgomery street, San Francisco, Cal., on Monday, the 31st day of December, 1888, at the hour of 2 o'clock p. m., of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of the sale.
J. J. SCOVILLE, Secretary.
Office—Room 59, Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

STOCKHOLDERS' MEETING.

OFFICE OF

The Superior Mill and Mining Company.

A SPECIAL MEETING of the stockholders of the Superior Mill and Mining Company will be held at the office of the company, Room 11, 303 California Street, S. Francisco, California, on Wednesday, February 20, 1889, at 1 o'clock p. m., for the purpose of taking into consideration the increasing of the capital stock of said company from ten million (10,000,000) dollars, divided into one hundred thousand (100,000) shares of the par value of one hundred (100) dollars per share, to fifteen million (15,000,000) dollars, divided into one hundred and fifty thousand (150,000) shares of the par value of one hundred (100) dollars each. Transfer books will close on Monday, February 13, 1889, at 3 o'clock p. m. By order of the Board of Directors.

Office—Room 11, No. 303 California Street, San Francisco, California.

FOR SALE.

The Empire Foundry and Machine Shop in the city of Marysville, now and for many years doing a remunerative business, is offered for sale at less than half its value. Everything as it stands—stock, machines, patterns, real estate, etc., will be sold on easy terms. A first-rate opportunity for establishing an agricultural implement manufactory as an adjunct. This is the only foundry and machine shop in the neighborhood.

For further particulars address

R. HOSKIN, Marysville.

DIVIDEND NOTICE.

SAN FRANCISCO SAVINGS UNION.
532 California St., corner Webb.
For the half year ending with 31st of December, 1888, a dividend has been declared at the rate of five (5) per cent per annum on term deposits, and four and one-sixth (4 1/6) per cent per annum on ordinary deposits, free from taxes, payable on and after Wednesday, January 2, 1889.

LOVELL WHITE, Cashier.

DIVIDEND NOTICE.

The German Savings and Loan Society,
526 California Street.

GEO. TOUBNY, Secretary.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

TO ALL INTERESTED IN THE USE OF COMPRESSED AIR.

NOW READY,
CATALOGUE No. 6,
CLAYTON AIR COMPRESSORS,
ROCK DRILLS,
And General Mining Machinery.

This Catalogue gives a full description of the Patented Improvements embraced in these unrivalled Air Compressors, together with tables, data, etc., of value to users of compressed air.

MAILED FREE ON APPLICATION,
Clayton Air Compressor Works,
43 DEY ST., NEW YORK.

IMPORTERS AND DEALERS IN

CAST and WROUGHT IRON SCRAP

SECOND-HAND BOILERS

AND OLD MACHINERY

Of every description

The Highest Price paid for all kinds of Metals.

OFFICE AND YARD: 128 and 130 Folsom St., S. F.

Telephone No. 07.

HORACE D. RANLETT,

Ores, Mining, and Commission,

420 Montgomery St., S. F.

BUSINESS MANAGER OF

UNION COPPER MINE, Calaveras Co.

NEWTON COPPER MINE, Amador Co.

Correspondent as Agent for Smelters in London, Liverpool, New York, Boston and Baltimore.

Twenty years experience, in California, purchasing Ores and dealing in Mines.

Special attention given to management and sales of mines and purchase and shipment of copper produce

STORAGE

We have some extra room suitable for storage purposes, which we will let on very reasonable terms. DEWEY & CO., 220 Market street, San Francisco, Cal.

FOR ENGRAVINGS of all kinds, apply to Dewey Engraving Company, No. 220 Market street, San Francisco.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required. In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,

Sole Manufacturers,

527 First Street. San Francisco, Cal.

GO TO THE OLDEST AND THE BEST.

1868. **PACIFIC Business College,** 320 POST ST. SAN FRANCISCO. 1888.

LIFE SCHOLARSHIPS, \$75. No Vacations. DAY AND EVENING SESSIONS. Ladies admitted into all Departments. Address: T. A. ROBINSON, M. A., President.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

A New and Important Book on Metallic Alloys, Solders, etc.

JUST READY.

METALLIC ALLOYS

A Practical Guide for the Manufacture of all kinds of Alloys, Amalgams, and Solders used by Metal Workers; together with their Chemical and Physical Properties and their Application in the Arts and the Industries; with an Appendix on the Coloring of Alloys. Translated and edited, chiefly from the German of A. Krupp and Andreas Willebender, with extensive additions, by William T. Brandt, one of the editors of "The Technical-Chemical Receipt Book," etc. Illustrated by 16 engravings. 12mo, 428 pages. Price.....\$2.50

By mail, free of postage, to any address in the world.

A descriptive circular giving the full contents of the above sent free to any one who will apply.

WE ALSO PUBLISH:

A Practical Manual of Miners', Mines and Mining: Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including Architecture and Construction. By Prof. H. S. Osborn, LL. D. Illustrated by 171 engravings. 8vo, 367 pages. Price.....\$4.50

A descriptive circular giving the full contents of the above book sent free to any one who will send his address.

A Treatise on Metalliferous Minerals and Mining. By D. C. Davies. With 148 illustrations. 12mo, 432 pages. Price.....\$5.00

Mine Drainage. By Stephen Mitchell. 8vo, 277 engravings. Price.....\$5.00

A Treatise on Earthy and other Minerals and Mining. By D. C. Davies. With 76 engravings. 12mo. Price \$5.00

The Prospector's Hand Book. A Guide for the Prospector and Traveler in search of Metal-bearing or other valuable Minerals. Illustrated. 12mo. Price.....\$1.50

Mineralogy Simplified. Easy Methods of Identifying Minerals, including Ores, by means of the Blowpipe, by Flame Reactions, by the Spectroscope and by Humid Chemical Analysis, based on Von Kobell's Tables for the Determination of Minerals, etc. By Henri Ertl, M. D. Illustrated. 12mo. Price.....\$3.00

Underground Treasures: How and Where to Find them. A Key for the Ready Determination of Minerals within the United States. By James Orton. Price \$1.50

The above or any of our Books sent by mail, free of postage, at the publication prices to any address in the world.

Our New and Revised Catalogue of Practical and Scientific Books, 84 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.
